INTRODUCTION

The 12th World Congress of the International Association for Semiotic Studies “New Semiotics. Between Tradition and Innovation” took place in Sofia, Bulgaria, between 16 and 20 September 2014. It was the result of one year of intensive preparatory work, 5 days of semiotic performances by more than 500 semioticians from 61 countries, plus 1.5 years of “postproduction”. Semio2014 was a big congress: if we compare the programs and the abstract books with the 10th IASS Congress in A Coruna, Spain, there is still the same number of papers. It is a good tendency, considering the aggressive EU policies of cutting university budgets, privatization and labour market efficacy, where the humanities in particular have suffered. Indeed, this tendency had its negative impact on the 12th Congress in respect of a reduced presence of scholars from EU countries. Yet, fortunately, it was balanced by a positive tendency, as we witnessed more and more semioticians, coming from the “non-Western” world, with a particular boom of Brazilian scholars – more than 50 of them participating in Sofia. Certainly there were more participants also from China and the other countries from the Far East, compared to the previous congresses in Europe.

The impact of these trends on semiotic production is important and shapes the new face of semiotics. Just a quick view of the contents of the Proceedings is enough to note that semiotic inquiry combines tradition and innovation in an exemplary way. More traditional are the contributions in the theoretical area of semiotics, where 54 papers have been placed, covering classical topics such as Peirce, Saussure, text, sign, culture, nature, narrative, time, art, law, gender, etc. The new face of semiotics is revealed with the applied semiotics section (57 papers) and the section devoted to semiotics in interdisciplinary context (30 papers). There one can enjoy semiotic explorations of topics ranging from Elves to selfies, from Jean-Paul Gaultier to battered women,

from digital nomads to African folk dances, from the Harry Potter saga to schizophrenia, from heavy metal CD covers to the pet world, from manga and anime to narco-traffic, and the list continues. The innovation that is so characteristic of semiotics is reflected also in the large number of papers directly or indirectly dedicated to the internet and digital culture. In all these new openings for semiotic interest is obvious a reduction of the methodological rigor, typical for the first decades of publications of the proceedings. Another trend, also based on comparison with Proceedings from previous Congresses, is evinced in the higher number of papers in English in respect to the other three official languages of the IASS/AIS. Less than 20% of the papers in the current Proceedings are in French and Spanish and only one paper is in German.

The introduction to the general character of the contents of these Proceedings can stop here. Nothing more is necessary in presenting a rationale for this collection. But as generative semiotics teaches us, the most interesting things usually remain beneath the textual surface; they inhere in the process which creates the textual result.

The interesting procedural questions are as follows: “Why are the proceedings in online form?”, “Why does it take so long after the Congress to publish them?”, “How many of the participants in the Congress submitted their papers to the Proceedings?”, “Where are the plenary papers?”, “How was the evaluation process organized?”.

Many of the answers of these questions derive from the strategic choice of the organizers of the Congress to exploit the advantages of digital communication. Thus, Semio2014 became the first fully “digital” IASS congress (cf. Copley and Bankov 2016). That decision facilitated a kind of “crowd sourcing” from the early preparatory phase when only the general division of theoretical, applied, interdisciplinary and regional semiotics was offered. There was not a formal centralized scientific committee; the proposals for round tables were sanctioned by a debate through social media, generating a number of proposed papers. In this phase it became clear that the chairs of the proposed sessions were responsible, together with the organizing committee, for the quality and the pertinence of the papers, included in them. This networked approach helped us to create a program which was more representative of the state of the art in world semiotics, in contrast to a centralized approach in which, geographically and managerially, one overview of semiotics would be maintained. The same philosophy of “crowd sourcing” is transferred to the Proceedings project. Our internal editorial board carried out much work on the received papers; but the final decision on quality and inclusion was the responsibility of the roundtable chairpersons. Thus the editorial board of the present book includes virtually all 37 chairpersons of the represented roundtables!

And where are the plenary speakers? Actually the traditional plenary role, in which a conference is ‘led’ by ‘famous’ scholars, was not replayed in Semio2014. The Congress featured two Honorary Guest Speakers - Jaakko Hintikka and Solomon Marcus - who, since the Congress, have sadly passed away. We mark their passing and pay tribute to these revered scholars by opening these Proceedings with their papers. The major innovation in the Congress, however, was that we substituted the plenary speech format with the series of lectures under the banner, “Semiotics and Its Masters”. We did that not only for budgetary reasons, but also to avoid the limitation of having only 8-10 plenary speakers at most. About 40 distinguished semioticians from all possible continents (except Antarctica) were contacted and given the chance to present a speech under the aforementioned banner. Ultimately, 29 lectures from the series were included in the program. From the very beginning, those papers were planned to be published as a separate volume in order to maintain two records of the Congress: one record concerned with the breadth and innovation of semiotics represented in the Congress and one with slightly longer, thematic contributions which would be attractive to a commercial publisher and would provide a more digestible account of the ‘state of the art’ in semiotics at the time of Semio2014. The latter

project is in an advanced phase, within the Semiotics, Communication and Cognition [SCC] series of de Gruyter Mouton, and will be published later in 2016.

Let us be clear that the academic publishing landscape has started to resemble a minefield and that the Congress organizers and the IASS have been committed to finding publishing options which would best benefit the members in the long term. Already during the preparatory phase of the Congress, the organizers were subject to the “predatory open access publishing” phenomenon, an industry with elaborate tools that seeks to achieve its goals through aggressive approaches to conference organizers. So, after the online appearance of the first drafts of the program of the Congress, I was contacted by a dozen known and unknown publishers who were interested in publishing the proceedings. Some of these proposals were elaborated with concrete references to the Congress topics. What struck me in particular regarding their aggression, was that after the rejection of some of these proposals those same publishers started to contact the round table chairs. Thus I myself was contacted by the same publishers in my capacity of chair of one of the round tables, with reference to the contents of the concrete round table, having already rejected the publisher’s approach in my capacity as Congress organizer. I know that many other chairs received such proposals and I know that some of them have accepted them. Thus, we have “lost” certain number of papers from the general corpus of the Proceedings and there has been an undesirable division of our collective endeavour. Furthermore, most of the publishers involved in these activities are attracted to scholarly societies because they believe that they can demand excessive payments for publication.

I mention this issue in relation to the Proceedings because it bears closely on the plans of future IASS Congresses and the best representation of the membership. The IASS is committed to developing a unified publishing policy in respect of the Proceedings, its agreements with commercial publishing, its flagship journal, plus the growth of regional, local and specialized journals in semiotics. In respect of the latter, recent research by our colleagues from Tartu¹ reports that there are at least 53 regular periodical semiotic journals, and many others that are not regular enough to enter the list but which are active anyway. Some of these published round table papers from Semio2014, rendering the current Proceedings a little less than the fullest possible account of the Congress..

For the future, the IASS, in agreement with the next World Congress, organizer, Dario Martinelli, have taken the decision to start to publish the proceedings of each World Congress in a sustainable and independent way as a periodical edition. We choose to do it under the label of “IASS Publications”, with the collaboration of the publishing house of the host of future Congresses. In this way, if the IASS and the Congress organiser maintain the regularity of the publication, it will be possible to consolidate and obtain all necessary contemporary formal recognitions for the quality of the research of our international semiotics community such entering the SSCI listing, impact factor rating, etc. Thus, the IASS World Congress proceedings will be competitive within the semiotic community and, most of all, the IASS proceedings will not depend on “the mercy of predatory publishers”.²

In one way, the last couple of years have been pernicious to our semiotic community. Many distinguished figures passed away. The loss of Umberto Eco was particularly difficult because it meant that the last ‘giant’ of semiotics is gone. Umberto Eco was kind enough to give one of the last long interviews in his life on the occasion of the opening of the World Congress in Sofia, where all participants could watch the video. Here, below, I would like to include an extract from

¹ Kull, Kalevi and Maran, Timo. 2013. “Journals of semiotics in the world”. *Sign Systems Studies* 41(1), 2013, 140–145

² See Copley and Bankov, “Vistas for organized global semiotics” to appear in *Semiotica*, Autumn 2016.

this interview where our *Spiritus Rector* offers some interesting details about the organization of the first World Congress of the IASS/AIS and some observations on semiotics in general.

Last but not least, I would like to thank the team of the Southeast European Center for Semiotic Studies, all of whose members worked hard in order to make possible the publication of the Proceedings. Thousands of pages, hundreds of hours of reading, editing, contacting chairpersons and authors, uploading, etc. The members of the team are: Ivan Kasabov, Mony Almalech, Borislav Gueorguiev, George Tsonev, Reni Iankova, Dimitar Trendafilov, Ivo Iv. Velinov, Yagodina Manova and Andrey Batchvarov (RIP). But most of all I would like to thank *Boyka Batchvarova*, whose heroic efforts were decisive and were made in conditions of the terrible family loss.

AN INTERVIEW WITH UMBERTO ECO (1932-2016)

In occasion of the 12th World Congress of the International Semiotic Association (IASS/AIS)
17 July, 2014

Monte Cerignone, Molise, Italy

Interview taken by Kristian Bankov

(La entrevista en español)

How did the first IASS/AIS congress start, in 1974?

The organisers were just me and my secretary.

The idea originated when the semiotic association in Paris was founded, there was a first, actually a second meeting in Warsaw, but it was soon after the invasion of Czechoslovakia.

There was the meeting in Paris with Jakobson, Benveniste, Greimas... I think I'm only one... no, Kristeva and I are the only ones still alive among the participants of that meeting.

And there the idea that a conference ought to be done came up. Then there was a last meeting in Parma, because the publisher Franco Maria Ricci wanted to invite everyone... the last elections were held. Cesare Segre was elected president and I was elected as secretary – I had no desire to do it at all – but Jakobson insisted and said: “Go to the congress!”

Well this meeting was... the thing in Warsaw was in 1968 and then the meeting... the meeting was in 1971 or 1972, and we started looking for money for the congress. But we were soon disappointed. It was supposed to be an organisation from Genoa. But later, Genoa didn't do it, and so on...

Finally the Gemelli institute of Milan provided some funding, they gave us the hall, and there was some small private support. But it wasn't much. We had twenty million at that time to pay everything. Twenty million were nothing. Twenty million lire [ten thousand euros].

Just to pay for a journey from America required at least one million. We had to refund Jakobson, Sebeok, all these people. Finally we got it done. The only thing is, we didn't expect all those people to come.

Were there many participants?

We expected about 200-300 registrations... 800-900 persons arrived.

And very important people, whom I hadn't invited.

Lacan for example... We didn't think about inviting Lacan because he wasn't exactly a semiotician.

And the day before the opening we had a party in my home, where we met people we believed had died twenty years before: Buysens, David Efron (the one who studied gestuality).

We had written to them, and they came. And so there were all of them. All! I remember that my secretary was staring at them because she said: "It's been two years that I've been reading their names, just the names. Now I can see them here and discover that they are real, that they really exist." The event had been well organised, so that after the opening session various separate sessions started. And at some point I found myself sitting on the steps of a stair, having nothing to do because everybody was in the right place. Every session had its own director, I realised that everything was fine.

What is the 'added-value' of a world congress?

First, we actually had to figure out in what sense people were interested in semiotics. Paul Watzlawick, from the Palo Alto school, arrived there unannounced. He came there and at that point we realised that also that kind of research could have a semiotic side.

If you look indeed at the congress proceedings there are different sections, and it became clear that semiotics is not a discipline. Something I had always claimed, and still claim now, even more, although many of my colleagues disagree. I think semiotics should have become a university organisation, a faculty, rather than a discipline.

Let's think, for instance, about medicine. What do dietetics and oncology, phthisiology and gastroenterology have in common?... they are techniques and have one thing in common: the health of human body. Not only that: between different sections, between an oncologist and a dentist, there's an abyss, but also within the same specialisation there are different schools. I wrote this also in the preface of *Semiotics and the Philosophy of Language*: there's a general semiotics which, for me – not for many others – is still a philosophical discipline concerning the foundation of semiosis, of the sign. Well, I'm linked to Peirce... And then there are specific semiotics which can also be very different amongst each other. Although, at the beginning, during the structuralist phase, we thought we could find general categories which could work... Looking for articulations not just in language but also in cinema... We also acted naively... such as precisely when we thought we could find general categories... And this is not the case. Because the more semiotics distributes itself to different sectors, the more it discovers universes with their own rules. To dominate all these specialisations there should be what I call general

semiotics. That is exactly the one I practised myself. In the sense that, yes, at the beginning I dealt with cinema, visual arts, but then I let other people do it, specialised people, so that they could specialise in those things. I limited myself, especially in the last works, to general theoretical problems.

Nowadays, in my opinion, there are few people who are studying general theory, and several who practise, for instance, sociosemiotics, etc... which is good, but if we look at the programme of the semiotic congress in Berkeley in 1994, there were even some disciplines which studied such incredible topics as the afterlife. In that, I think, we had gone a bit overboard, but what I still believe is that what analytic philosophers called the 'linguistic turn' of our time, has actually been a 'semiotic turn'. All disciplines, not just humanities – but also genetics... the genetic code, DNA, etc. – significantly oriented themselves towards the semiotic problem. So that a conference took place in Lucca in 1981-82 where we had immunologists themselves willing to meet the semioticians in order to find points in common. A problem indeed occurred there. Where they thought they could see semiosis, I could only just see a stimulus-response.

At that time semiotics was quite fashionable. How did it develop later?

Yes it was, but there were other phenomena afterwards. While in Italy, and in Germany semiotics continued to develop, the French at some point, driven by reciprocal envy, began to say: "I'm not doing semiotics anymore...", "I'm doing psychoanalysis", as Kristeva used to say... Todorov has done history of culture and other wonderful stuff. And thus, what took, so to speak, the leadership of semiotics, was the Greimassian school. And that's it. At least in Paris. Then if you look at a peripheral university, you might come to know that there are people doing semiotics who are not necessarily Greimassian. But those who claim that there is one scientific semiotics are the Greimassians

In the United States there has been, so to speak, a clash with analytic philosophy... which, in itself could well be understood as an interesting form of semiotics. Especially if we look at its critics like Rorty. We have done many conferences together. But in America there are 'magic words'. 'Semiotics' didn't sell well. Later some universities like Brown started a PhD programme in semiotics, but at that point cultural studies had become fashionable. Remember that someone doing sociosemiotics is doing cultural studies. But they changed the name of the PhD programme and they called semiotics 'cultural studies'. There are *shibboleth* working there, passwords, so to speak, marketing words. And, therefore, America is a special case.

Did you know that the country with the largest number of participants is Brazil?!

But South America always kept going. Brazilians in particular were considerably involved. Brazilians were working on Peirce before the whole semiotic issue in Europe started. They were all Noigandres poets: Haroldo De Campos, Augusto De Campos, Décio Pignatari were studying Peirce in the fifties. Obviously they were wrong, because they used to study Max Bense's books, who never understood Peirce, but alas!

What would 'the semiotic tradition' be?

We shouldn't throw away tradition... there are some among my friends who have begun to say: "Let's not throw away Saussure". Let's not throw away those from whom we started. For a while semiotics seemed to be all structuralist, and it was like structuralism and semiotics were the same thing, and it was not true. At some point structuralism was thrown out of the window, but we were not meant to get rid of everything.

How do you see semiotic innovation?

‘Innovation,’ let’s try to understand. In the hard sciences there’s a huge sense of continuity: “I say something only basing myself on what the previous scientist said, and I expand, prove, disprove, etc.” Analytic philosophy has tried to reproduce this attitude of the hard sciences: “We have a very precise corpus, everyone produces a small article starting from a previous article by someone else...”

Typically in the humanities there’s the myth of ‘novelty at all costs.’ The French are the masters in this sense: “I can be noticed only if I say the contrary of what has been said before.” If that’s what we mean by ‘innovation,’ then the method is detrimental. To the point that it reverses the meaning of words. So that for example we can have Baudrillard calling ‘seduction’ what for other people is not seduction. An attempt to always be, as Maritain used to say, *Les chevalier de l’absolu...* That’s why I was talking about innovation and tradition. We don’t have to always pretend to say the contrary. Maybe it’s also a Hegelian vice. We negate what has been previously said, in order to go forward.

And innovation in a positive sense?

Part of my group tried to merge semiotics and cognitive sciences in the 1990s and 2000s, and so at the University of San Marino, founded by us... we’ve done about twenty very interesting conferences. They were attended by all the major scholars of cognitive sciences, and good relationships have developed. I think that while early semiotics was still the victim of a dogma affecting all philosophy – “We can’t talk about mind”, so either we talk about behaviour or about so-and-so... – with cognitive sciences we realised that we need to talk also about mind.

I always insist on recalling something: Adriano Olivetti, who was a great man, employed engineers in his company when necessary, because he needed them. However, if possible, he also employed people who majored in Greek philology, or philosophy. And then he would send them to the factory for six months in order to see what happened. But he knew that someone who had studied humanities had a mind more open to innovation.

What are you working on now?

I’ve always been of the idea, and I’ve always said, that after turning fifty one has to focus only on Elizabethan poets, whom one knows how to study. One should let young people deal with novelties instead.. It’s not that I’ve actually studied Elizabethan poets, but I have partially diverted to historical studies. I don’t know if you’ve seen the large volume on the history of medieval thought.

And now I am collecting all my semiotic writings. The outcome will be around three thousand pages. Now they are all in the hands of someone, who is only putting together a single bibliography, without modifying the texts. Just unifying and editing them. The result will be a two-volume set. Some sort of funeral offering to be placed into the pyramid for the dying pharaoh!

And then, you know, I have had a strange life line, interrupted in the middle as if I had died at fifty years old, but after continuing like this. And what happened in the middle of my life? I started writing novels. Therefore that’s a parallel life.

You took the another way, probably a more rewarding one...

Well, a more amusing one. Now there’s a new novel. It’s already written. It’s a grotesque representation of journalism. [...] It’s the story of a newspaper which might seem a bit Berlusconi, even though the story occurs in 1992, before Berlusconi entered politics.

What should we expect and what can we achieve by a congress?

The results of a congress can only emerge later. When we prepared the congress in 1974 we didn't expect there to be the high level of participation that there actually was. Perhaps it would have taken only a small mistake in communicating it, and only a hundred people would have come, and nobody would have ever talked about semiotics anymore. The result of a congress is not a final dogmatic document. A congress generates proceedings. And there you can find what is available. It all depends on the productivity and novelty of the proceedings.

What would you wish for the participants?

What would I wish for the participants? Preserve paper! Preserve paper! Do not only study online.

Because a big blackout will occur, everything will disappear and only your books will last!

ENTREVISTA A UMBERTO ECO (1932-2016)

Por Kristian Bankov

17 July, 2014

Monte Cerignone, Molise, Italia

Video (<https://www.youtube.com/watch?v=ixnN-a7Ei6E>)

¿Cómo transcurrió el primer congreso de IASS/AIS en el año 1974?

Lo organicé yo con la ayuda de mi secretaria. La idea surgió cuando se fundó la Asociación de Semiótica en París, después tuvo lugar una primera, es decir una segunda reunión en Varsovia, pero eso fue inmediatamente después de la invasión en Checoslovaquia. En aquella reunión, que se organizó en París, participaron Jacobson, Benveniste, Greimas... me parece que soy el único ... No, creo que de los asistentes al primer encuentro somos Kristeva y yo los únicos que todavía quedamos vivos. Y fue allí donde surgió la propuesta de organizar un congreso. Más tarde tuvo una última reunión en Parma puesto que el editor Franco M^a Richi quiso invitar a todos ... y se realizó la última selección. Chesare Segre fue elegido Presidente y a mí me nombraron secretario – no me gusto para nada – pero Jacobson insistió y dijo: ¡Adelante el congreso!

De modo que, aquella primera reunión fue en 1968 en Varsovia, la segunda se realizó en 1971 ó 72 y nos pusimos a buscar dinero para el Congreso. Y vivimos grandes desilusiones.

Esperábamos recibir el dinero de una organización de Génova. Sin embargo, los de Génova no lo hicieron, etc., etc. Al fin el Instituto *Gemelli* de Milán nos proporcionaron una pequeña cantidad de dinero, nos concedieron una sala y pudimos contar con una donación privada. Pero no era suficiente. Entonces reunimos 20 millones para pagar todo. 20 millones no era nada. 20 millones de liras (10000 euro).

Solamente un billete de avión de América costaba un millón. Tuvimos que pagar el viaje de Jacobson, de Sebeok, de toda esta gente. Y lo logramos. Pero no pensamos en que llegaran todos.

¿Realmente hubo tantos participantes?

Nosotros pensábamos que se matricularan 200-300 personas, pero llegaron 800-900. Y llegaron personalidades de renombre que yo no había invitado. Como Lacan, por ejemplo ... No se me había ocurrido invitar a Lacan ya que él no es precisamente un semiólogo.

La víspera de la inauguración organicé una recepción en mi casa a la que acudieron personas que creíamos muertas desde hacía unos veinte años: Buysens o *David Efron, el mismo que ...* Buysens, *David Efron* – él que se había ocupado del estudio de la gesticulación. Les escribimos y ellos llegaron, ¡llegaron todos! Recuerdo que mi secretaria miraba con los ojos desenchajados y decía: “desde hace dos años que no hago más que leer nombres y ahora los veo aquí y ¡encuentro que son reales!” Y todo fue bien organizado, después de la apertura empezaron su trabajo las secciones diferentes. Y, de repente, me encontré sentado en el peldaño una escalera y ya no tenía qué hacer porque cada uno ocupaba su propio lugar. Cada sección tenía su presidente y me di cuenta de que todo estaba en orden.

¿Qué es lo que aporta un congreso internacional?

En primer lugar, nos interesaba qué rumbos toma el interés de la gente por la semiótica. Había llegado inesperado Paul Watzlawick, él de la escuela de Palo Alto. Estaba allí y nos dimos cuenta de que las investigaciones que él realiza también tienen que ver con la semiótica. En efecto, si se miran las Actas del Congreso, de verdad hay varias secciones y allá se esbozó hasta cierto grado lo que yo siempre he afirmado y sigo afirmando, mientras muchos de mis colegas no lo aceptan, y es que la semiótica no es precisamente una disciplina. Y si se compararía con una organización universitaria ella fuera un facultado. Demos el ejemplo de la medicina. ¿Qué es lo común entre la dietología y la oncología, o entre la fisiología y la gastroenterología? Son disciplinas unidas por un denominador común: la salud del cuerpo humano. Aún más: entre las secciones diferentes, entre un oncólogo y un dentista existe un abismo, pero también en los marcos de una especialidad hay escuelas diferentes. Esto lo he escrito en el prólogo de *Semiótica y filosofía del lenguaje*: existe una semiología común que para mí aún es una disciplina filosófica sobre el fundamento de la semiosis, del signo, pero para muchas otras personas no es así. Pues, es verdad que yo estoy relacionado con Peirce ... Y luego hay semióticas especializadas que pueden ser muy diferentes una de otra, aunque al principio, por ejemplo en la época del entusiasmo por el estructuralismo, se pensaba que se podían encontrar categorías comunes que funcionaran como tales... Se buscaban articulaciones no sólo en la lengua pero también, digamos, en el cine ... Admitimos incluso tantas cosas ingenuas... llevados precisamente por la idea de encontrar categorías comunes... Y no es así porque cuanto más se divide la semiótica entre los sectores diferentes tanto más se descubren universos con leyes propias. Todas estas ramas deberían ser dominadas por lo que yo llamo *semiótica común*. Que es lo que me ha ocupado a mí. Sí, en un principio me ocupaba del cine, de las artes visuales, Pero después dejé que de ello se ocupara la otra gente especializada en estas esferas específicas. Yo me limité -antes que nada en mis últimos trabajos- a los problemas teóricos generales. En mi opinión, creo que hoy en día, son pocas las personas que se ocupan de teoría general y son

muchas los que se ocupan de, no sé... de, digamos, sociosemiótica, etc. ...Lo que no está mal, pero si se observa el programa del congreso de semiótica en Berkeley, en 1994 fueron incluidas numerosas disciplinas que hasta llegaron a tratar la vida después de la muerte. Creo que fue una exageración, pero yo sigo considerando que lo que los filósofos analíticos llaman *linguistic turn*, de hecho es *semiotic turn*. Todas las disciplinas y no solamente las humanísticas – y pensad en la genética ... en el código genético, en ADN ... están muy orientadas hacia el problema de la semiosis. Entre otras cosas, entre 1981 y 1982 tuvimos un congreso en Luca, en que participaron inmunólogos que deseaban reunirse con los semióticos para encontrar puntos comunes. Y allí surgió un problema de verdad. Donde ellos pensaban ver la *semiosis*, para mí había nada más *stimulus response*.

En aquellos tiempos la semiótica estaba muy de moda. ¿Cómo se desarrolló después?

Sí, pero después ocurrieron otras cosas: aquí es mientras en Italia o en Alemania la semiótica continuaba desarrollarse, llegó un momento en que los franceses, cada uno celoso de lo que hacía el otro, manifestaron: “Ya no me ocupo de semiótica... me ocupo de psicoanálisis”, declaró Krasteva; Todorov empezó ocuparse de la historia cultural y de otras cosas realmente estupendas. Y la que tomó la dirección de la semiótica, fue la escuela de Greimas. Y punto final, no se habló más. Por lo menos en París. Luego, si uno iba a ver las universidades periféricas, se daba cuenta de que había quienes se ocupaban de la semiótica sin necesariamente pertenecer a la escuela de Greimas. Pero los que pretenden que existe una sola semiótica científica son los seguidores de Greimas.

En cambio, en los Estados Unidos, pues, se dio un choque con la filosofía analítica la cual, fíjense en sumo grado se puede ver como una forma interesante de la semiótica. Sobre todo, si seguimos sus críticos como, por ejemplo, Rorty ... ¡Hemos participado juntos en tantos congresos! Pero en América hay palabras mágicas. „Semiótica“ no se encuentra entre ellas pero se vende bien. Algunas universidades como Brown University, crearon doctorados en semiótica, pero entonces se pusieron de moda los *cultural studies*. Tened presente que quien estudia socio-semiótica, estudia *cultural studies*, pero cambiaron el nombre del doctorado y le pusieron *cultural studies*. En los Estados Unidos deslizan hacia las consignas, quiero decir, a las comerciales. Pero los Estados Unidos es un caso aparte.

¿Sabía usted que el mayor número de participantes viene de Brasil?

Sí, América Latina en general y los brasileños en particular se han ocupado muchísimo de semiótica. Los brasileños estudiaban a Peirce antes de que el interés por la semiótica apareciera en Europa. Todos los poetas del grupo de *Noigandre*: Aroldo De Campos, Augusto De Campos, Decio Piñatari durante de los años cincuenta estudiaron Peirce. Por supuesto, Cometían un error porque lo estudiaban en los libros de Max Bense quien nunca entendió a Peirce, pero no importa...

¿En qué consiste la tradición semiótica?

Consiste en que no se descarte nada ... uno de mis amigos insistía: „Que no echemos a Saussure!“. No arrojamos a los de quienes marchamos. En un momento la semiótica parecía toda estructural, y parecía que el estructuralismo y la semiótica eran la misma cosa, pero no es así. Hubo un tiempo en el que el estructuralismo fue negado, pero no hay que negarlo todo.

¿Cómo ve Ud. la innovación semiótica?

La innovación... aclaremos de que se trata. Mientras en las ciencias naturales la continuidad tiene gran importancia yo digo sólo lo que ha dicho algún científico anterior a mí y sobre

esta base edifico, aduzco pruebas, refuto, etc, la filosofía analítica, por ejemplo, ensayó imitar las ciencias naturales; existe un corpus muy puntual, cada uno escribe un artículo pequeño marchando del artículo de alguien adelantado. En las ciencias humanísticas existe el mito de la novedad a toda costa. Y los franceses son auténticos maestros en este sentido. Repararán en mí sólo si digo lo contrario de lo que ya se ha dicho antes. Si la innovación es esto, entonces ella es un proceso perjudicial. Ellos incluso cambiaban el sentido de las palabras. No sé, Baudrillard que llama seducción (seduction) lo que para otros no es seducción. Lo de ellos no es más que un intento de estar siempre *Les chevaliers de l'absolu*, como decía Maritain. Pues no, por eso acabo de decir tradición e innovación. No hace falta simular a toda costa que se dice lo contrario. esto puede tratarse incluso de un vicio hegeliano. Se niega lo que fue para seguir adelante.

¿Y la innovación en el sentido positivo?

En los años noventa y en dos mil una parte del grupo en que trabajo trató unir la semiótica a las ciencias cognitivas y en la Universidad de San Marino, fundada por nosotros, organizaron unas veinte conferencias muy interesadas, a las que asistieron todos los grandes científicos en la esfera de las ciencias cognitivas y establecimos contactos muy fructíferos. Creo que en un principio la semiótica fue víctima de un dogma que pesaba sobre toda la filosofía – „ es imposible hablar sobre la mente“... – o se habla del tratamiento o se habla no sé de qué pero no de la mente. Después de las ciencias cognitivas se llegó a la conclusión de que habría que hablar sobre la mente. Yo recuerdo algo con insistencia: Adriano Olivetti, que era un gran hombre, empleaba ingenieros en su fábrica de ordenadores siempre que los necesitaba. Prefería, sin embargo a titulados en Filología griega o en Filosofía y los enviaba a la fábrica, a ver qué pasaba. Sabía que los que habían estudiado Humanidades eran más abiertos a la innovación. Pero prefería si era posible unas personas que tenían diploma de filología griega o filosofía y así les mandaba a la fábrica, para ver que pasará. Pero sabía que quien ha estudiado ciencias humanitarias pertenece un mente abierto hacia las innovaciones.

¿ En qué trabaja Ud. ahora?

Siempre he creído y lo he dicho, que después de cumplir cincuenta años, uno ha de ocuparse únicamente de los poetas isabelinos. (rie). Las novedades hay que dejarlas a los jóvenes. Y él sabe cómo se estudian a los poetas isabelinos. No es que yo estudie, a los poetas isabelinos, pero me he apartado un poco y me ocupo de investigaciones históricas. No sé si habéis visto el gran volumen dedicado a la historia del pensamiento medieval. Actualmente hago una recopilación de mis escritos semióticos. Serán aproximadamente tres mil páginas. Ahora mismo todos ellos están en las manos de un hombre quien tiene la tarea de igualar la bibliografía. Pero sin tocar los textos apartados. Tiene que compaginarlos, ponerlos en orden. Se publicarán en dos volúmenes con idéntico diseño. Algo semejante de un regalo funeral predestinado a ser depositado en la pirámide, junto con el faraón muerto. (ríe)

Y luego sabéis que la línea de mi vida es rara (muestra su palma), se interrumpe en la mitad, es decir que debería morir a mis cincuenta años, pero después continúa. Y así ocurrió: en la mitad de mi vida empecé a escribir novelas. O sea, existe una vida lateral.

Ha emprendido Ud. un viaje diferente, puede que sea más satisfactorio...

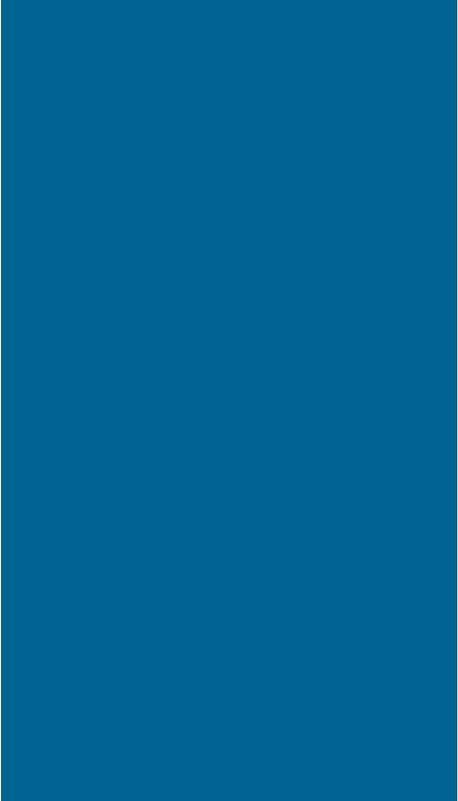

Sí, por lo menos más divertido. Ahora tengo una novela nueva. Ya escrita. Una presentación grotesca del periodismo. (...) La historia de un periódico que se parece un poco al de Berlusconi, aunque el argumento se desarrolla en 1992, antes de que Berlusconi entrara en la política.

¿Qué podemos esperar, qué resultará de los congresos?

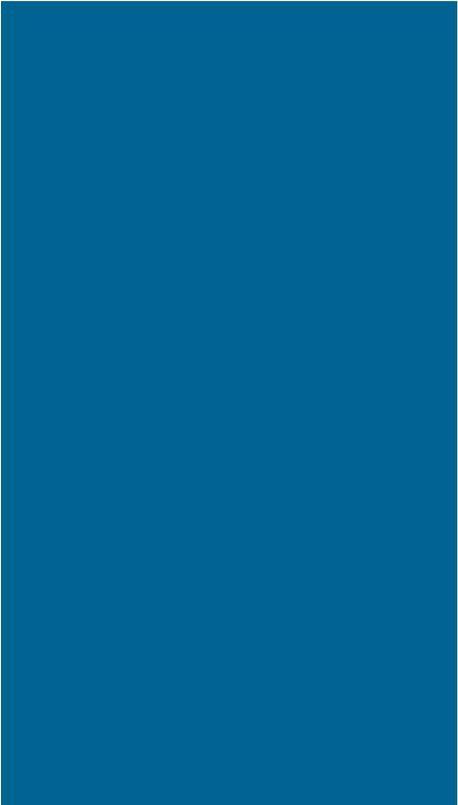

Cómo ha resultado un congreso se entiende sólo después. Cuando preparamos el congreso de 1974 no esperamos que tuviera la divulgación que tuvo. Era posible que se diera una mínima falta de comunicación para que llegaran tan sólo 100 personas y que nadie volviera a hablar de semiótica. Lo que pasa después del congreso es que no se elabora ningún documento dogmático. Sí se prepara la publicación de las Actas y en las ellas se puede encontrar lo que hay. Depende de la riqueza y las novedades que contienen las

¿Qué les desearía Ud. a los participantes?

¿Qué desearles a los semióticos? Que defiendan el uso del papel. Defended el papel, no aprendáis únicamente *online*! Porque llegará el gran *blackout*, todo desaparecerá y sólo vuestros libros permanecerán (ríe).

**HONORARY
GUEST
SPEAKERS**

Jaakko Hintikka (1929-2015)

Prof. Jaakko Hintikka is known as the main architect of game-theoretical semantics and of the interrogative approach to inquiry, and also as one of the architects of distributive normal forms, possible-worlds semantics, tree methods, infinitely deep logics, and the present-day theory of inductive generalization. He has authored or co-authored over 30 books and monographs that have appeared in nine languages. Five volumes of his Selected Papers (Kluwer Academic) appeared in 1996-2003. Jaakko Hintikka has edited or co-edited 17 volumes and authored or co-authored over 300 scholarly papers. A comprehensive examination of his thought appeared in 2006 as the volume *The Philosophy of Jaakko Hintikka* in the series *Library of Living Philosophers*.

Solomon Marcus (1925-2016)

Solomon Marcus is a Romanian mathematician, member of the Mathematical Section of the Romanian Academy and Emeritus Professor of the University of Bucharest's Faculty of Mathematics. His main research is in the fields of mathematical analysis, mathematical and computational linguistics and computer science, but he also published numerous papers on various cultural topics: poetics, linguistics, semiotics, philosophy and history of science and education. He is recognized as one of the initiators of mathematical linguistics and of mathematical poetics, and has been a member of the editorial board of tens of international scientific journals covering all his domains of interest.

LANGUAGE-GAMES AS A FOCAL NOTION IN LANGUAGE THEORY

Jaakko Hintikka

Abstract

Wittgenstein introduced the language game idea to emphasize that language use is a rule-governed activity. But how do rules govern our linguistic behavior? After a long search, Wittgenstein decided in May 1941 that the meaning relations are constituted of entire language-games that are primary in relation to their rules. A language game is not defined by its rules. To understand the rules one has to master the game.

An application of the mathematical theory of games to language-games led to game-theoretical semantics, which is the true conceptual basis of logic and mathematics. It has prompted important new developments in logic and in the foundations of mathematics, including more relaxed concept of probability. In the light of game-theoretical semantics, the logic that Frege formulated and that was canonized as traditional first-order logic is flawed in the sense of being too poor conceptually. This flaw is being corrected by the development of independence-friendly logic and its extensions.

Game-theoretical semantics can also help to integrate syntax and semantics. Rules for a move in a semantical game (language game) typically involve both an action on the part of a “player” and also a syntactical transformation rule to indicate what the next move will be like. Those transformations are all the syntax that is needed in an overall language theory. They are but an aspect of the semantical game rules.

In these days, if I mention language-games, the first association of my audience is likely to be Wittgenstein. But what did Ludwig think about language-games? One reason why it is fascinating to study Wittgenstein’s thought is that his notebooks, his philosophical diaries enable us to

follow the dynamics of his development, almost re-living his line of thought. So let us fly our time-machine to the late May 1941. What we find is Wittgenstein in an agonizing crisis. Usually he writes only a couple of sentences daily in his diary. Now he writes in the three days (May 23–26) something like fifteen pages. He writes a sentence, strikes it over, tries to write a better one, corrects it or offers an alternative formulation and so on.

But what is he so excited about? Bertrand Russell once asked Wittgenstein whether he was thinking about logic or about his sins. Wittgenstein replied: “Both”. In those May days (may-days?) he would not have given either answer. But he could have said “meaning” or “meaning and language-games”. Wittgenstein was struggling with one of the main problems of all language theory. What are the meaning relations that enable us not only to understand a name or a sentence but to use language in our transactions with reality? How are the expressions of our language connected with the world?

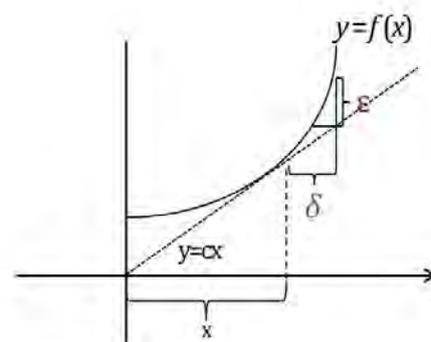

In his *Tractatus*, Wittgenstein had defended an answer that in its simplest form amounts to saying: by picturing. Propositions are pictures of possible states of affairs and names represent objects by sharing the same logical form. By 1929 he nevertheless had given up this idea of language as a mirror of a (possible) world and replaced it by a vision of language as a rule-governed human activity (or, rather, a complex of such activities). This puts the main theoretical onus on the notion of rule. But what is a rule? Wittgenstein rejected in October 1929 phenomenological languages as our actual basis language in favor of physicalistic language. Hence rules must operate through their actual symbolic expressions, written instructions, formulas, samples and suchlike. But how can such external objects in Wittgenstein’s vivid words “dead” objects guide my decisions? His problem was not how to follow a rule, but how a rule can guide my actions. This is not a problem about us humans only. How does a rule, for instance a blueprint guide a machine? Wittgenstein did not ask: does a computer think? but: does a computer compute?

Wittgenstein pondered on such questions from 1933 on. In May 1941 he realized that he was not making any real progress. We do not need rules as an explanatory notion, he came to think. We can understand and describe exhaustively a person’s actions and other behavior without referring to rules as separate entities. On the contrary, we can understand the rules one is following only by reference to the complex of interrelated activities that it is a part of, “Language-games” is but a label to those activities. Thus Wittgenstein’s conceptual priorities switched. He came to believe that in the last analysis one cannot define a game by its rules. One can understand a rule only via the game that it is an aspect of. Rules became conceptually secondary in relation to their language games.

This, then is Wittgenstein’s (perhaps we should say, the third Wittgenstein’s) answer to the question of what the links are that connects language with reality: The links are language-games. This already is enough to make them a focal notion in the study of language.

This may be a truth and nothing but the truth, but it is not the whole truth about language or about language-games. Wittgenstein’s own account of language-games is unsatisfactory, or at least incomplete and impressionistic. One source of dissatisfaction with it is that Wittgenstein does not ever give fully worked-out large-scale examples of intrinsically interesting language games. In particular, he does not explain what the language-games are that lend our logical and mathematical words their meaning, in spite of having himself used logic and mathematics as testing-grounds of rule-following. But Wittgenstein aside what are the language games like give logic and mathematics their meaning? Remarkably Wittgenstein need not have construct such games himself. He may have been the first one to use the term “language-game”, but highly interesting language-games had been examined by an earlier thinker. As Risto Hilpinen was the first one to point out, the real inventor of language games was no other than one of the fathers of semiotics, Charles Sanders Peirce.

The games he was particularly interested in were precisely the ones that are involved (“played”) in logic and in its uses in mathematics. One can get an idea of what they are from the so-called epsilon delta technique of calculus texts. For instance, the definition of the continuity of a function $f(x)$ at x might be read: Given any ε , however small, one can find δ_0 such that $\|f(x+\delta)-f(x)\|<\varepsilon$ as soon as $\delta<\delta_0$. Here the locution “one can find” does precisely the same job as the existential quantifier ($\exists\delta$) and the force of a “given” is that of a universal one. In general, the logical home of one basic logical notions, quantifiers, “every” and “there exists” (“some”) are the language-games of seeking and finding. Intuitively, in the associated picture we can find an arbitrarily small δ no matter what ε is given. As an illustration, you can contemplate the following figure that displays the epsilon-delta definition of derivative.

$c = \text{derivate of } f(x) \text{ at } x$

What is going on is that you can make ε small as you wish by pushing $x+\delta$ close enough to x .

Several questions arise here. Are we really talking here of genuine games? Can a linguist or semiotician actually recognize such a game when it is being played? As an answer, imagine watching a bunch of children moving around. Surely from their behavior you can find out that they are playing hide-and-seek.

Perhaps you still feel like asking, as the late Erik Stenius once asked me: How can the ideas of seeking and finding help to constitute our notion of existence, codified in the existential quantifier? I replied: Erik, in your native Swedish language, how do you express existence? You say, “det finns”, literally “one can find”. And Swedish is not the only language to do essentially the same.

I will not try to examine in detail how Peirce used this language-game idea. It was for Peirce originally a semiotic rather than logical idea. Even though there are several important connections between the game idea and Peirce’s different treatments of logic, he never quite integrated it with the rest of his logical theory, certainly not into a formal system of the same rigid structure as Frege’s contemporary logic.

Why not? One of the first ideas that occurred to me when I internalized Wittgenstein’s notion of language-game was: this opens vast theoretical opportunities. Wittgenstein’s contrary view notwithstanding, “games” are not so called by mere family resemblance. There exists an explicit, fully developed mathematical theory of games, launched by John von Neumann, Borel, and Morgenstern. We can now use it in language theory, perhaps more its concepts than its results. Language-games can be thought of literally as games in the sense of von Neumann’s mathematical theory of games. The outcome is the fundamental semantical theory of logic known as game-theoretical semantics. Even though it is not generally used yet, it is superior to the usual Tarski-type semantics. The truth of a sentence S can be defined in it by a reference to the associ-

ated game $G(S)$ of attempted verification. But truth does not mean a verifier's winning a play of $G(S)$. It means the existence of a (sure-win) strategy to the verifier.

So why did Peirce not develop an explicit game-theoretical semantics? An answer, or at least an important part of an answer, lies in the very nature of game theory. "Game-theory" can even be claimed to be misnamed. It applies to activities we do not call games ("games against nature"). The intended "games" are not all competitive, either. The key notion of this theory is not "game" but "strategy". It could more accurately be called strategy theory rather than game theory. And strategies can be strategies of cooperation rather than strategies in a conflict situation.

Game theory was born, I am tempted to say, at the moment von Neumann (or was it Borel?) introduced the general notion of strategy. Unfortunately, that happened after Peirce, who therefore could not avail the notion of strategy. This deprived him of the main concept needed to regiment the use of the game idea. This is seen particularly clearly in the games that serve as the semantical basis of logic. They are stereotypical real or fictional attempts to find a fragment of the world in which a sentence S is true. As was pointed out, the idea of language game enables us to define explicitly the crucial semantical concept of truth. This is not possible to do to one's own language if we are using the common Tarski-type semantics, as Tarski's famous impossibility result suggests. This impossibility result, though applicable to the kind of language Tarski used, does not concern suitably richer languages. Tarski's famous theorem accordingly has little philosophical or semiotic interest.

There are plenty other opportunities opened up by various applications of game-theoretical semantics. One of the first questions that a game theorist would ask about semantical games is: Are they games of perfect information or not? In other words, does a player making a move always know what earlier moves have been made? At first sight, informationally imperfect games might seem to be impossible or at least unrealistic. They are nevertheless instantiated by card games like bridge in which a player does not know other player's hands. Such games can be handled conceptually as interpreting a "player" as a team like partners at bridge that not share their information. They do not know what cards their partner has.

What about the games that are the semantical home of logic and mathematics? It turns out that Frege's logic involves a tacit assumption of perfect information. This assumption has turned out to be a vicious mistake. Language-games with imperfect information might seem to be exotic animals, but in reality you can find them all over the place. For instance, in the mathematical example about continuity, δ is obviously chosen knowing ϵ . But is it chosen knowing x or not? In the usual notion of continuity, a dependence of δ on x and not only ϵ is assumed. But if we do not assume it, we obtain a different notion called uniform continuity. Such uniformity concept play an important role in mathematics.

Frege's tacit assumption of perfect information imposed a heavy restriction on what his logic can do. Later logicians followed his example, with the result that for more than a century logicians used unnecessarily weak logic. In this respect, Peirce was far ahead of Frege. Not only was he aware of the nature of uniformity concepts and even occasionally corrected professional mathematicians when they made a mistake. This makes a big difference to how we look upon the entire history of modern logic. Usually Frege is considered as the architect of the basic part of our contemporary logic referred to as quantification theory or first-order logic. While Peirce is relegated to the role of a slightly later co-discoverer, in reality, what Peirce had in mind was a far richer logic than what Frege and following him practically all other logicians have been using for more than hundred years. Only in the nineteen-nineties was the flaw in Frege's and his followers' logic pointed out and partly corrected in what is misleadingly labelled independence-friendly (IF) logic.

The notion of language-game is thus operative in putting several main issues to a new light.

One more such potential change of approach still remains to be pointed out. It concerns the relation of syntax and semantics. The two are in our day and age usually considered as separate studies. Here semioticians are doing better than linguists or analytical philosophers of language. For one thing, there is the famous Chomskian thesis of the autonomy of syntax. Generative grammarians maintain that one can construct a complete syntax for a (natural) language without appealing to semantical considerations.

This may in fact be a reasonable approximation to syntax, even though there are no general theoretical reasons for such a complete autonomy. I once offered a small concrete example of syntactical regularities in English that have only a semantical explanation. The example was the distribution of the English quantifier word “any”. Even though this is only a miniscule and undoubtedly exceptional detail in the overall English syntax, the issue was felt to be so significant that Noam Chomsky himself paid me the enormous tribute of criticizing my note in public. (He does not bother to criticize unclear or unimportant ideas.)

Even if Chomsky were right, the relation of semantics to syntax would be a major problem. The history of Chomsky’s own views illustrate the issues. At an early stage of his views, the possibility of generating syntactically a sentence in two different ways was supposed to explain its ambiguity, as in example like

(1) *Visiting relatives can be boring.*

Later, the hypothesis of deep structure was proposed. It was proposed, not so much by Chomsky himself as by some of his associates that the syntactical generation of a sentence happens in two stages. First, phrase structure rules generate the so-called deep structure. This deep structure is then subjected to various transformations in the technical syntactical sense. The crucial assumption is that the semantic interpretation of the sentence operates on the deep structure. Transformations were assumed not to affect meaning.

This deep structure theory soon proved inadequate. In the light of hindsight, linguists ought to have realized that the deep structure could match the logical form of sentences and that transformations like the passive transformation could change meaning. For instance, the sentences

(2) *Someone can beat anyone.*

(3) *Anyone can be beaten by someone.*

do not mean the same.

Later, generative grammarians gave up the deep structure idea and rehearsed other linguistic structures for the role of a logical or semantical structure.

At one point, Chomsky thought that the logical forms of natural-language sentences might be captured by the formulas of first-order logic. This is a mistake. In its usual formalization, first-order logic operates with quantifiers with variables bound to them. In contrast, natural languages (and some logical languages) operate with choice terms. There is a certain irony here. Choice terms were called denoting phrases by Bertrand Russell who sought to dispense them by reducing them to a quantifiers notation.

Game-theoretical semantics offers a solution to the problem of semantical structure. The fact admittedly is that the semantical meaning of a sentence (its interpretation) has to be gathered from syntactical clues. Wittgenstein once wrote: “If you ask me how you can understand what I say, when all that you have are my symbols, then I ask you, how can I understand what I say, when all that I have are my symbols”. In a semantical game, the next move is determined by the sentence that the players are considering at the time of the move. For instance, if the sentence

governing a move is $(\exists \xi)A(\xi)$, then the verifier must try to choose an individual b that satisfies $A(b)$. The newly introduced $A(b)$ is then sentence governing the next move. But that sentence $A(b)$ is not the initial sentence of the game. It is the sentence considered in the game at the time, and that sentence changes at each move syntactically and not only semantically. In our example it changes from $(\exists \xi)A(x)$ to $A(b)$. Rules for moves in a semantical game must accordingly have a syntactical component, rules for forming the new sentence to be considered at the next move.

Those rules move from compound sentences to simpler ones, the end-points being atomic sentences or their negations. If these rules are inverted so as to operate from the simpler to the more complicated and newly introduced constants are replaced by variables, they become rules for constructing the earlier sentences from later ones. Such rules can now be taken the rules of a generative grammar of the language in question. This grammar would be all that a language user needs to know in order to construct or to understand a sentence. More specifically, the whole syntax of the language or language fragment in question is captured by the syntactical part of those inverted game rules. This integrates syntax and semantics completely. Among other things, it shows what the syntactical clues are that direct a language user's semantical choices.

For instance a semantical game might start with the sentence

(4) *Tom is not the only man who loves his wife.*

As you can see, this is ambiguous. The ambiguity is brought out by the negation of (4)

(5) *Tom is the only man who loves his wife.*

(Negation rule changes the respective roles of the verifier and the falsifier.)

(6) *Tom loves his wife, while no one else does it.*

(Game rule paraphrasing (5).)

(7) *Tom loves his wife.*

(Conjunction rule from (6).)

(8) *No one else loves his wife.*

(Same conjunction rule. Both outcomes of this rule will be considered in what follows.)

(9) *Someone else loves his wife.*

(Negation rule applied to (8).)

(10) *Dick is not Tom, and Dick loves his wife.*

(Existential instantiation. Intuitively, the verifier finds Dick.) From (10) the game may move to either of the following:

(11) *Dick is not Tom, and Dick loves Dick's wife.*

(12) *Dick is not Tom and Dick loves Tom's wife.*

(These are obtained by a game rule for dealing with (i.e. interpreting) personal pronouns.)

If we replace “Dick” by a variable, the reverse of either sequence from (12) or (11) back to (4) might be part of a syntactical production of (4), not unlike Chomsky’s two ways of generating (1).

This is an illustration of how rules for semantical games can operate both as rule for syntactical generation and as rules of semantical interpretation.

Such a unification of syntax and semantics offers several further advantages for linguistic theory formation. An interesting advantage is that we do not now have to locate the features that prompt the application of a game rule in the initial sentence, but only the sentence that is being considered at the time of the application of the game rule in question. For instance, we do not have to have a rule telling how to introduce the second individual constant by looking only at (4). This applies also for instance to syntactical rules like rules for reflexive pronouns. The use anaphoric pronoun like “myself” is obligatory when it occurs in the same clause as its head, however that clause need not occur in the initial sentence, but in the sentence considered by the players at the stage at which a rule is applied. For instance a semantical game might lead the players from

(13) *I saw a snake near me.*

to

(14) *I saw a snake on the lawn, and the lawn was near me.*

Why is “myself” not obligatory in (13)? Because the first-person pronoun needs to be “interpreted” only in (14), not yet in the initial sentence (13).

A general advantage is that the integrated theory vindicates Chomsky’s ingenious early idea that a sentence derivably syntactically in two different way may for that very reason be semantically ambiguous. (See e.g. (8) above.)

Even more generally, we can see that anaphora is not a matter of coreference, but of the dependence of semantical rule application on each other. This is illustrated by a plethora of examples

(15) *There is nobody there, for he would have had to climb over the barbed-wire fence.*

(16) *I drive a Volvo. They are safe cars.*

(17) *A couple was sitting on the bench. Suddenly she got up.*

In none of these examples is the anaphoric pronoun in any natural sense coreferential with its head. Instead, the semantical interpretation of the anaphoric pronoun depends on that of its head. (Would one utter (17) on the proverbial isle of Lesbos?)

So far I have examined primarily such language-games as can be illustrated by means of games of seeking and finding. There are nevertheless other game-like activities including in-

volving language that can also be called language games. Formal deduction can be considered as such a game. An important case in point are games of questions and answers. Such games are especially useful in epistemology. Indeed, any new item of information that enters into one's reasoning can be thought of as an answer to an explicit or implicit question.

In epistemology, the nature of game theory as a strategy theory becomes crucial. In philosophical epistemology the main attention has been devoted to the evaluation of information that we already have, at the expense of the study of the ways of finding new truths. A study of the strategies of questioning is the best way of correcting this bias. The questioning games offer too large an embarrassment of riches to be discussed in detail here.

Leibniz once wrote that human nature reveals itself in games. Perhaps we can say that the nature of language is best revealed in games. I suspect that Peirce might have agreed with me.

Postscript: In order to avoid misunderstanding, I want to make it clear that game-theoretical semantics and IF logic are established branches of logical studies, but that the interpretation of syntax and semantics envisaged toward the end of this paper is at the present time only a project.

Literature

Many of the topics dealt with in this lecture are examined in my earlier work, including the following books:

HINTIKKA, K.J.J., 1985, *Anaphora and Definite Descriptions (with Jack Kulas)*, D. Reidel, Dordrecht

HINTIKKA, K.J.J., 1991, *On the Methodology of Linguistics (with Gabriel Sandu)*, Basil Blackwell, Oxford

HINTIKKA, K.J.J., 1998, *Paradigms for Language Theory*, Kluwer Academic, Dordrecht

HINTIKKA, K.J.J., 2007, *Socratic Epistemology*, Cambridge University Press, Cambridge

HIDDEN SIGNS. THE LITERARY FACE OF THE NON-LITERARY TEXTS

Solomon Marcus
Romanian Academy & University of Bucharest
solomarcus@gmail.com

Abstract

There is a quasi-general agreement about the legitimacy and the high interest to read as literary works the Bible, Plato's Dialogues, Herodotus' Histories and many other religious, philosophical or historical works. Is there a similar legitimacy to consider the literary dimension of human creativity in fields like exact sciences, natural and engineering sciences, information sciences, linguistics, medical sciences, economics, sociology, psychology, juridical sciences etc.?

We bring some arguments in favor of an affirmative answer to this delicate question.

Literature, with Homer, and Mathematics, with Thales and Pythagoras, are daughters of the Ancient Myths, from which they inherited some of their basic features: the symbolic function; the need of a fictional universe; the holographic capacity to give to the local, the individual, the instantaneous the capacity to account for the global, the general, the eternal respectively; the need of paradox and of metaphor etc. During about two thousand years, science and culture were a mixture of mythical elements, literature, science and philosophy. Archimedes, some of the Catholic theologians of the Middle Age, Spinoza, Newton, until important authors of the 20th century in fields such as physics, biology or linguistics followed the axiomatic deductive type of presentation proposed by Euclid's Elements. Lucretius, Copernicus, Galilei, Kepler, in their famous works, are both important scholars and writers and the same is true for Augustine and for Aquinas. Italo Calvino gave a very deep argument for the high literary dimension of Galileo Galilei's writings and his debate with Carlo Cassola whether science and literature have

to say something each other deserves great attention. Calvino, a real European Borges, is in contrast with Roland Barthes' claim of a radical opposition between science and literature.

One can distinguish, in the last three thousand years of the cultural history of mankind, two lines of development. One of them was trying to organize the human knowledge and creativity in *disciplines* looking desperately for their *identity*, each of them aiming to become *a world in itself*. The other line of development made as its main object of inquiry the need of different aspects of nature and culture to be *together*, to *interact*, and to develop their *metabolism*, in absence of which you cannot understand them in their real nature.

1. To get order, we have to pay a price

The need to introduce some *order* in human knowledge and creativity, when their complexity was increasing, lead to the *segmentation in disciplines*; but this is obtained at the expense of the *nature of things*, because *reality, life phenomena and processes either ignore disciplines or go across them*. In order to bridge this gap, an alternative line of development directed its focus towards transgression of the disciplinary borders.

2. The great failure

As a matter of fact, these two lines of evolution are complementary, they need each other, but it happened that their synergetic capacity was not enough strong and the former line of development obtained the victory at the expense of the latter, in the way cultural institutions and systems of education were conceived. The second line remained rather hidden and now we try to recuperate, to bridge this gap.

The literature is one of the victims of this situation. To the need to develop a therapy of this illness, we devote our work.

3. A quasi general agreement

There is a quasi general agreement about the legitimacy and the high interest to read the *Bible* as literature or to read *Plato=s Dialogues* as literature or to consider Herodotus=*Histories* a literary work. We believe that this capacity of literature to be solidary with / inseparable from other types of human creativity and to interact with them is just its strong point. The problem begins to become more difficult and controversial as soon as we refer to the possible literature hidden in works belonging to exact sciences, natural sciences, information sciences, engineering sciences, economics, to some other social sciences. In this respect, some preliminary clarifications are necessary, because we have to face a lot of prejudices. The topic we are considering is of a high complexity.

4. Daughters of the ancient myths

In the Greek tradition of the Western World, Literature (beginning with Homer) and Mathematics (beginning with Thales and Pythagoras) are both daughters of the ancient myths, from which they inherited some of their basic features.

Need of a presence accounting for an absence. We refer first to the symbolic function, essential in myths, in poetry and in mathematics. More generally, sign processes of all kinds, iconic, indexical or symbolic, are essential.

Need of a fictional universe. Then, all these fields need to place their action into a fictional universe. Points, as things having no part, and lines, as things having no thickness, are the starting fictional characters in Euclid's *Elements*; equally fictional are the characters of the tragedies of Sophocles. In both cases, a fictional scenario is developed. The fiction is the price to be paid in order to get some rigour, be it logical or artistic.

The holographic capacity. Myths, poetry and mathematics need a *holographic capacity*, i.e., a capacity of some local, individual aspects to account for the global, the collective ones; of some

instantaneous aspects, to account for the eternity. In all myths, irrespective the traditions to which they belong, *anthropos* and *cosmos* are in interaction, the former is accounting, in some respects, for the latter. In poetry as well as in mathematics, the finite, the individual, are accounting for the infinity, the global, the total. The beginning of *To See a World ...* by William Blake is a magnificent illustration of this principle:

*To see a World in a Grain of Sand
And Heaven in a Wild Flower,
Hold Infinity in the palm of your hand
And Eternity in an hour.*

In mathematics, a lot of theorems account for the possibility of the finite to account for the infinity or for the small finite to account for the large finite. The so-called *analytic functions* are completely determined in the whole complex plane by their behaviour in the neighbourhood of a point.

Transgressing classical logic. Myths, literature and mathematics need to transgress the logic governed by the principles of identity, non-contradiction and excluded middle, i.e., the logic of our sensorial, empirical, intuitive perception of the world, and to replace it by a logic in conflict with this perception. During the 20-th century, a lot of so-called *non-classical logics* were introduced and this fact is strongly connected with another one: the *paradox*, considered at the beginning of the 20-th century a pathological, marginal phenomenon, became, with the evolution of logic, physics, biology, computer science and many other fields, a normal, central phenomenon, just as it is in ancient myths and in modern visual arts, music and literature.

A special kind of temporality. We know now that there is a strong parallelism between myths, quantum physics and art, each of them having a tendency towards a temporality that could be the cancellation of the past-present-future distinction, to be replaced by a continuum present; and the same type of temporality seems to prevail in the perception of a new born baby.

Metaphor at home in mathematics. *Metaphor* is another thing which is essential in myths, in literature and in mathematics. If for metaphor in myths and in literature things are very clear, an explanation is necessary for metaphor in mathematics. We have in view the *cognitive metaphor*, as a basic ingredient of the research process, for instance in the building of new concepts and in exploring new possible theorems. In (Marcus 2012), I described the way cognitive self-referential metaphors (i.e., metaphors that refer not to a pre-existing entity, but to an entity emerging just under the action of the metaphorical process) are involved in the building of the conceptual status of integers, of rational numbers and of real numbers. On the other hand, it was proved (Lakoff B Nunez 2000) that with respect to the brain mechanisms involved in the creative process; mathematics is essentially of a metaphorical nature. A similar conclusion is suggested by (Manin 2007).

5. A cocktail of myths, science, and literature

During about two thousand years, science and culture were a cocktail of mythical elements, literature, science and philosophy (see, for more, Bochner 1966). Plato's *Dialogues*, Lucretius' *De rerum natura*, the works by Augustin, Aquinas, Copernicus, Galileo Galilei and Johannes Kepler are in this situation. In (Frankfort et al 1946) it is analyzed the importance of bringing together math, poetry and philosophy in Plato's and Aristotle's works.

Poetry, natural sciences and philosophy are at home in Lucretius' poem.

A contemporary reader could not believe that in a work, where a lot of interesting scientific facts are pointed out (for instance, he argues in this work that all unequal weights would fall with the same finite speed in a vacuum) and ideas of a natural philosophy are developed, the literary

beauty is the dominant note, as in the beginning of this poem:

Mother of Rome, delight of Gods and men,
 Dear Venus that beneath the gliding stars
 Makest to teem the many-voyaged main
 And fruitful lands - for all of living things
 Through thee alone are evermore conceived,
 Through thee are risen to visit the great sun-
 Before thee, Goddess, and thy coming on,
 Flee stormy wind and massy cloud away,
 For thee the daedal Earth bears scented flowers,
 For thee waters of the unvexed deep
 Smile, and the hollows of the serene sky
 Glow with diffused radiance for thee!
Lucretius - On the Nature of Things (Written 50 B.C.E.)
Translated by William Ellery Leonard

A term of reference: Euclid's Elements. Indeed, for almost 2000 years, many of the most important cultural works be they scientific, theological or philosophical, such as those of Archimedes, Augustin, Aquinas, Spinoza, Newton followed in their presentation the architecture of Euclid's *Elements*.

The poetic dimension of the father of heliocentrism. We refer to Nicolaus Copernicus' 1543 *De Revolutionibus Orbium Coelestium* [On the revolution of the celestial spheres].

Here are some quotations (English translation from 1926 by F.E. Bras).

That the Earth went round the Sun
 and not vice versa, as had been thought

For when a ship is floating calmly along,
 The sailors see its motion
 Mirrored in everything outside,
 While on the other hand
 They suppose that they are stationary,
 Together with everything on board,
 In the same way, the motion of the Earth
 Can unquestionably produce
 The impression that the entire Universe
 Is rotating.
(Ship, Earth, Motion)

For I am not so enamored
 Of my own opinions
 That I disregard
 What others may think of them.
 I am aware that
 A philosopher's ideas
 Are not subject
 To the judgement of ordinary persons.

Because is his endeavour
 To seek the truth in all things
 To the extent permitted
 To human reason by God.
 Yet I hold that
 Completely erroneous views
 Should be shunned.
 Those who know
 That the consensus of many centuries
 Had sanctioned the conception
 That the Earth remains at rest
 In the middle of the Heaven
 As its centre would.
 I reflected, regard it as insane pronouncement
 If I made the opposite assertion
 That the Earth moves.
 (*Opinion, Reason, Earth, Heaven*)

Finally we shall place
 The Sun itself at the centre of the Universe.
 All this is suggested
 By the systematic procession of events
 And the harmony of the whole Universe,
 If only we face the facts,
 As they say,
 AWith both eyes open.
 (*Sun, Universe*)

6. Galileo, secondo Calvino [Galileo according to Calvino]

In a first step, Anna Maria Ortese is addressing Italo Calvino:

È il 24 dicembre 1967. Da una decina di anni sonde e satelliti artificiali solcano lo spazio fuori dalla Terra. Italo Calvino ha appena pubblicato *Ti con zero*. E Anna Maria Ortese sulle pagine del *Corriere della Sera* gli scrive una lettera, datata 24 dicembre 1967.

*'Caro Calvino,
 non c'è volta che sentendo parlare di lanci spaziali, di conquiste dello spazio, ecc., io non provi
 tristezza e fastidio; e nella tristezza c'è del timore, nel fastidio dell'irritazione, forse sgomento e an-
 sia. Mi domando perché'*

La scrittrice, autrice di un acuto e indimenticabile *Il mare non bagna Napoli* con cui ha vinto il Premio Viareggio, è angosciata dal nuovo mondo tecnologico, che trova una clamorosa rappresentazione nei razzi che sfrecciano nello spazio.

In a second step, Calvino to Ortese:

La risposta, immediata, di Italo Calvino viene pubblicata quello stesso giorno sulle pagine del medesimo giornale e giunge forse inaspettata ad Anna Maria Ortese. Certo contiene un'impegnativa serie di giudizi su Galileo Galilei, su Giacomo Leopardi e sull'influenza del primo sul secondo.

'Cara Anna Maria Ortese,

guardare il cielo stellato per consolarci delle brutture terrestri? Ma non le sembra una soluzione troppo comoda? Se si volesse portare il suo discorso alle estreme conseguenze, si finirebbe per dire: continui pure la terra ad andare di male in peggio, tanto io guardo il firmamento e ritrovo il mio equilibrio e la mia pace interiore. Non le pare di "strumentalizzarlo" malamente, questo cielo?

Io non voglio però esortarla all'entusiasmo per le magnifiche sorti cosmonautiche dell'umanità: me ne guardo bene. Le notizie di nuovi lanci spaziali sono episodi d'una lotta di supremazia terrestre e come tali interessano solo la storia dei modi sbagliati con cui ancora i governi e gli stati maggiori pretendono di decidere le sorti del mondo passando sopra la testa dei popoli.

7. Galileo, il più grande scrittore italiana in prosa [Galileo, the greatest Italian writer in prose]

[...] **Chi ama la luna davvero non si accontenta di contemplarla come un'immagine** convenzionale, vuole entrare in un rapporto più stretto con lei, vuole vedere di più nella luna, vuole che la luna dica di più. Il più grande scrittore della letteratura italiana di ogni secolo, Galileo, appena si mette a parlare della luna innalza la sua prosa ad un grado di precisione e di evidenza ed insieme di rarefazione lirica prodigiose. E la lingua di Galileo fu uno dei modelli della lingua di Leopardi, gran poeta lunare...

Per Calvino, dunque, Galileo non è solo un grande scienziato e un grande filosofo. È anche un grande scrittore. Anzi, il più grande scrittore della letteratura italiana.

Cassola to Calvino

Carlo Cassola è tra i primi a reagire alla provocazione di Calvino. Non passa una settimana che il Corriere della Sera pubblica (31 dicembre 1967) un articolo molto duro a firma dello scrittore romano: *Domenica scorsa, su questo giornale Italo Calvino ha affermato che Galilei è il più grande scrittore italiano di ogni secolo. Io credevo che Galilei fosse il più grande scienziato, ma che la palma di massimo scrittore spettasse a Dante+.

Non si tratta di un'improbabile gara a chi meriti la palma del migliore scrittore. Ma dei fondamenti stessi della letteratura e della cultura. Mentirei – scrive Cassola – se dicessi che l'affermazione di Calvino mi ha scandalizzato. Lo spirito di dimissioni di molti miei colleghi è giunto a un punto tale che non mi scandalizzo più di niente. L'augurio che rivolgo loro è di liberarsi del complesso di inferiorità nei confronti della cultura scientifica e della tecnologia. E se no, che cambino mestiere.

8. Scienza e letteratura hanno nulla da dire l'una all'altra [Science and literature have nothing to say each other]

Carlo Cassola, dunque, pone due temi. Il primo è un assoluto: scienza e letteratura sono dimensioni comunicanti. Hanno nulla da dire l'una all'altra. Irrimediabilmente: Galileo è uno scienziato, dunque non è uno scrittore. Il secondo tema è più contingente: gli scrittori italiani son subalterni alla cultura umanistica. Una tesi che ha una versione speculare negli ambienti scientifici, secondo cui in Italia sarebbe egemone una cultura umanistica di impronta crociana e gentiliana che impedisce alla cultura scientifica di diffondersi nel paese sia tra le grandi masse, sia tra le classi dirigenti.

Calvino to Cassola

Calvino risponde a Cassola qualche settimana dopo, con intervento su L'Approdo letterario. In primo luogo:

Maggior nutrimento in Galileo

Intendevo dire scrittore di prosa; e allora lì la questione si pone tra Machiavelli e Galileo, e anch'io sono nell'imbarazzo perché amo molto pure Machiavelli. Quel che posso dire è che nella direzione in cui lavoro adesso, *trovo maggior nutrimento in Galileo, come precisione di linguaggio, come immaginazione scientifico-poetica, come costruzione di congetture.*

9. From Dante to Galileo

Infatti:

Galileo usa il linguaggio non come uno strumento neutro, ma con una coscienza letteraria, con una continua partecipazione espressiva, immaginativa, addirittura lirica.

Una coscienza letteraria che Galileo raggiunge soprattutto quando parla della Luna.
Leggendo Galileo mi piace cercare i passi in cui parla della Luna: è la prima volta che la Luna diventa per gli uomini un oggetto reale, che viene descritta minutamente come cosa tangibile, eppure appena la Luna compare, nel linguaggio di Galileo si sente una specie di rarefazione, di levitazione: ci si innalza in un'incantata sospensione.

Tutto questo giustifica il giudizio su Galileo scrittore. In particolare sul Galileo scrive della Luna dopo averla osservata, nell'autunno 1609, col nuovo occhiale.

Tuttavia Galileo non rappresenta una singolarità nella letteratura italiana. Al contrario ne incarna la più intima vocazione. E la dimostrazione l'abbiamo proprio partendo da Dante. Cosa fa il poeta fiorentino, sostiene l'autore di *Ti con zero*, se non realizzare con un'opera enciclopedica e cosmologica una mappa del mondo e dello scibile e costruire, attraverso la parola letteraria, un'immagine dell'universo?

Non c'è dunque davvero nessuno scandalo nell'accostare Galileo a Dante.

L'opera letteraria come mapa del mondo

Perché

Questa è una vocazione profonda della letteratura italiana che passa da Dante a Galileo: l'opera letteraria come mappa del mondo e dello scibile, lo scrivere mosso da una spinta conoscitiva che è ora teologica ora speculativa ora stregonesca ora enciclopedica ora di filosofia naturale ora di osservazione trasfigurante e visionaria.

La scienza e la filosofia naturale sono, dunque, la vocazione profonda della letteratura italiana. Una vocazione profonda, che coinvolge altri grandi autori – da Ariosto a Leopardi, entrambi *gran poeti lunari+. E che deve essere riscoperta, se vogliamo rinnovare la grandezza passata della nostra letteratura.

[Here is a free presentation in English of the controversy among Calvino, Cortese and Casolla:

In Italy's past century, a famous controversy about literary creativity took place among the writer Italo Calvino, on the one hand, and the writers Ana Maria Ortese and Carlo Casolla, on the other hand. In a letter published in *Corriere della Sera*, December 24, 1967, Ortese expresses her admiration but also her anxiety with respect to the new technological world, noisily represented by the cosmic space rockets. Calvino answers the same day, but referring to Galileo Galilei, to Giacomo Leopardi and to the influence of the former about the latter. "Dear Ana Maria Ortese, to look at the celestial stars as consolation for the life's brutalities, don't you think it is a too handy solution? You should conclude: the planet Earth may continue from bad to worse, but this fact will not stop me to contemplate the celestial stars and to find in this my stability and my interior peace". I don't want to join you in your enthusiasm for

the magnificent accomplishments of the cosmic flights. They are episodes of the fight for the terrestrial supremacy and they tell us how the governments of the big powers of the world want to decide the fate of the world, beyond the interests of the people [...]. Who loves the Moon, should not contemplate it as a conventional image; he should want to realize a direct relation with the Moon, to listen to its voice. The greatest Italian writer of all centuries, Galilei, when he refers to the Moon, he is raising his prose at an extraordinary degree of precision and of lyrical intensity. Galilei's language became a model for Leopardi, great selenic poet".

So, for Calvino Galilei is not only a great scientist and philosopher, he is also a great writer. Moreover, he is the greatest Italia writer. A few days later, at December 31, 1967, Carlo Casolla has a very hard reaction to Calvino's claim: "It is not Dante the greatest Italian writer, it is Galilei. Such a claim disturbs just the foundations of our literature and of our culture. But for me Calvino's claim is no longer scandalous. I observe to my colleagues a state of resignation, so nothing can be scandalous. I wish them to get rid of any complex of inferiority with respect to the scientific and technological culture. Otherwise, they should change their profession". So, Casolla claims that *no communication could exist between science and literature; they have nothing to say each other. As a derived statement, Casolla infers that Italian writers are subordinated to humanities, to a culture influenced by Croce and by Gentile.*

"Galilei, a strong literary consciousness" A few weeks later, Calvino retorts to Casolla. He says that Galilei is the first Italian writer in prose, in the same line with Machiavelli, while Dante is in poetry, and he adds: "Galilei's excellence can be seen in both language's precision and poetic imagination. For Galilei, language is not a neutral tool; he is using language with a strong literary consciousness, with a continuous expressive, imaginative and lyrical participation. Reading Galilei, I like to look for those places where he refers to the Moon; it is for the first time when the Moon becomes for humans a real object, something tangible. I feel in Galilei's language a kind of rarefaction, of charming floating. All these facts motivate to include Galilei among writers". Calvino refers to the moment, in Fall 1609, when Galilei observed the Moon with a new telescope. "Galilei is not singular in Italian literature. Dante himself realized an encyclopedic and cosmological work, by his literature. So, nothing surprising in placing Galilei near Dante. *Science and philosophy of nature are the deep feature of Italian literature, involving great authors, such as Ariosto and Leopardi, all of them great selenic poets*".

10. Calvino, the European Borges

Indeed, Calvino's ideas concerning the science-literature interaction are deeply involved in the creation of Luis Jorge Borges. Only one reference may be sufficient in this respect: the book by William Goldbloom Bloch (Bloch 2008).

11. Johannes Kepler, the triumph of a total vision

By his *Astronomia Nova* (1609) and mainly by his *Harmonices Mundi* (1619), Kepler is the highest expression and chronologically the last one in bridging successfully religious arguments and reasoning, astrology and astronomy, Pythagorean ideas and mathematics of planetary motion, Plato's five types of regular solids and the celestial music of spheres, all of them in a cosmic poetic perspective. His self-authored poetic epitaph survived the times:

*Mensus eram, nunc terrae metor umbras
Mens coelestis erat, corporis umbra iacet
[I measured the skies, now the shadows I measure
Sky bound was the mind, Earth bound, the body rests].*

12. Steps in the separation between literature and mathematics

The invention of an artificial component of mathematical language, with Galilei, Descartes, Newton and Leibniz, favoured the rupture, the opposition between poetry and mathematics. The natural language component of the scientific language became more and more marginalized: less and less words, more and more symbolic representations, formulas, equations. This trend reached in the 20th century its highest moment, not only in research, but also in university and high school teaching. The contrast to literature increased tremendously.

13. Another source of rupture: the elimination of the narrative dimension

During the period from the 17th to the 19th century, the evolution of mathematics was from the accent on meaning and intuitive aspects, favouring the narrative dimension, towards the accent on syntax, correctness and formal rigor. Compare, in this respect, the face of *Calculus* with Newton, Leibniz and Euler with the same field with Cauchy, Weierstrass and Riemann. *Rigor at the expense of meaning*, in terms proposed by René Thom. This trend was another source of opposition between poetry and mathematics, but it is strongly connected to the previous trend. Because the natural language component of mathematics became more and more marginalized, it was less and less place for intuition, for dynamic aspects, for narrativity, i.e., less and less possibility for mathematics to show its literary, poetic face.

14. Maxwell: the exception

There were some remarkable exceptions, one of them being the *Treatise on Electricity and Magnetism* by James Clark Maxwell (1873), which has both the status of a scientific and of a literary work. See, for more, (Simpson 2005). In the review by Brian Hayes (Hayes 2013) of this book, Hayes writes: AIn mathematics and the sciences, style and substance seem to be orthogonal variables B but on this point Thomas K. Simpson disagrees. Speaking of scientific works generally and with particular reference to James Clark Maxwell's *Treatise on Electricity and Magnetism*, Simpson writes: AIt seems to be generally assumed that the literary and the scientific aspects of the work will factor, so to speak, and remain separable.

15. A big change of paradigm

Towards the end of the 19th century, when we move from the dominance of the Galileo-Newtonian paradigm, based on the assumption of a sharp distinction between Subject and Object (the *objectivity* of science, of mathematics by excellence, was in clear opposition with the subjectivity of poetry) and the incapacity of the former to have a significant influence on the behaviour of the latter, to a new period, when all the components of the Galileo-Newtonian scenario (observation, hypothesis, experiment, induction, generalization, laws, experimental tests etc) get in crisis, because *the assumption of a clear separation between Subject and Object, the universal determinism and the experimental testing no longer work*. We have instead the increasing role of cognitive models and of cognitive metaphors, conceived as hypothetical explanatory scenarios characterized by internal conflictual situations, so any cognitive model or metaphor needs to be improved and the cognitive process never ends.

16. Barthes and Calvino

During three centuries, from the 17th to the 19th century, but still persisting in the 20th century, the dominant idea was that of a strong opposition between science and art, between mathematics and poetry, culminating in the vision of the French writer Roland Barthes, for whom in a poetic text the language is like a black window, it is self-referential, while in a scientific text the language is a neutral tool, exterior to him, like a transparent window. (Barthes 1967–1968)

But we are inclined to favour Italo Calvino's attitude (1982; 1986), according to which *a work may be at the same time great both as science and as literature* (Italo Calvino 1986).

17. Science and literature as complementary aspects of the same text

Calvino's example, as we have seen, is the work of Galileo Galilei, but he goes much beyond it with his analysis. My belief is that mathematics, science in general, has a chance to acquire a literary dimension as soon as it is presented in the making and in their progress, with all human and social aspects of the fight with the unknown, with all failures and mistakes in the process.

We mention some contemporary examples which are significant in this respect:

1. The way Donald Knuth (Knuth 1974) supplemented with a novelette John H. Conway's surreal numbers;
2. The story told by the Fields Medallist in mathematics Cedric Villani (Villani 2012), about his human fight to solve a mathematical problem;
3. The book by Bogdan Suceava (Suceava 2012) transforming his mathematical adventure into a literary story;
4. Our literary analysis of the mathematical texts published by the poet Ion Barbu under the name Dan Barbilian (Marcus 2013b).
5. The literary face of Economics is one of the main concerns in the works of Donald N McCloskey (McCloskey 1984) and Deirdre N. McCloskey (McCloskey 1994), (McCloskey 1998) (see mainly Chapter 2, *The literary character of Economic Sciences*, and Chapter 3, *Figures of Economic Speeches*).

In this respect, we took advantage of the concept of *diction (articulation) of the ideas* introduced and analyzed by Professor Mircea Martin for the field of literary criticism (Martin 2010), but whose validity and relevance seem to be more general. A lot of other examples could be mentioned in this respect.

18. Wonder and surprise

The science of the 20th century shows an increasing degree of surprise, more and more scientific results are in *sharp conflict with our sensorial, intuitive and intellectual expectations*. Scientific and technological imagination came as a shock, increasing the state of wonder in contemplating what happens in the new discovered worlds of the infinitely large and of the infinitely small; in the new discovered worlds of the Internet.

19. Invention and discovery: from asymmetry to symmetry

Until the 19th century, it was a general agreement to place science under the sign of discovery and art and literature under the sign of invention. Beginning with the 20th century, we have to accept that both invention and discovery are essential in both science and art.

20. The theatrical dimension

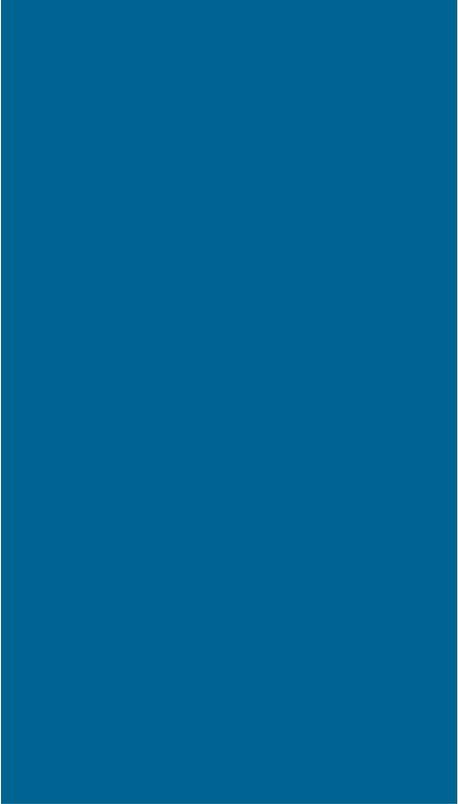

The emergence of the *conflictual* aspects in cognitive modelling and in cognitive metaphors, the need of imagination of more and more explanatory *scenarios* increased the theatrical-spectacular nature of human creativity in both science and literature (Marcus 2013a). Almost no significant event in the field of science and technology remained out of the attention of artists and writers. *Human need and fight to know, to understand the world, the life are by no means less interesting for art and literature than the man-woman relation.*

21. To conclude

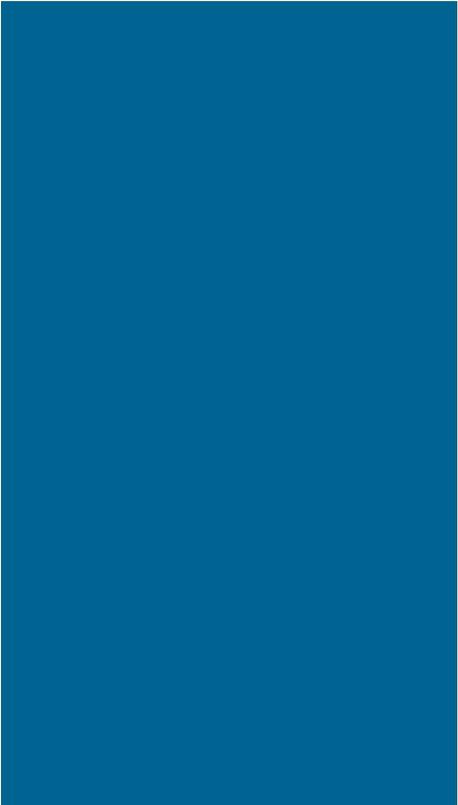

The second, hidden line of evolution of the human knowledge and creativity is, in some respect, more demanding, more exigent, than the first one, because it requires the understanding of different, heterogeneous disciplines, while we were trained to pay attention to one discipline, with respect to which we will define our profession. This is the challenge we have to face. Is literature living in a mixed environment inferior to the usual one? Two lines of evolution lead to two kinds of literature and we have to learn and to train to pay equal attention to both of them.

BIOSEMIOTIC ETHICS

A SEMIOTIC APPROACH TO THE PET WORLD

Panagiotis Xouplidis
Aristotle University of Thessaloniki
pxouplid@itl.auth.gr

Abstract

The Oxford English Dictionary defines pet as “any animal domesticated or tamed kept as a favorite or treated with indulgence.”

In modern Western societies pets are everywhere. In modern cities there are millions of pet dogs, cats, birds, fish, rabbits, snakes, and monkeys while modern economy includes a vast service industry that provides veterinary care, food, breeding, and assorted accessories. Looking through the historical evolution of mankind it becomes obvious that without the possession of the domesticated animals, man would have continued to be a savage; and that without the help of them, no considerable progress in civilization could have been achieved. This became possible through artificial selection, which is the selection of advantageous natural variation for human ends and it is the mechanism by which most domestic species evolved. A fact to be considered is, as Paul Shepard affirms, that: “Pets are not part of human evolution or the biological context out of which our ecology comes. They are civilized paraphernalia whose characteristic combination and accommodation is tangled in ambiguous tyranny. Although looked upon with affection, even modern pets are property that is bought, sold, put down and neutered.”

Pets are commodities that many people use, like other consumer goods, as a means of constructing identities, although they are also considered members of families and serve as companions providing considerable emotional attachments and satisfactions. It is likely that because of the social and economic conditions many middle-class people make substantial emotional

investments in their relationships with animal companions. The case is that humans not only attribute various mental states to one another but there is an irresistible primate tendency to generalize these attributions to pets and other animals. On one side, anthropomorphic thinking enables animal companions' social behavior to be construed in human terms. On the other side, anthropomorphism constitutes an evolutionary selection pressure which has defined the appearance, anatomy, and behavior of companion animal species.

The fact that pets occupy by default an equally great human need for non-human others in the contemporary urban American household is both obvious and perplexing. Americans spend over \$5 billion annually feeding dogs and cats alone, while only \$3 billion is spent on baby food (Beck, 1983; Pet Food Institute, 1986).

During the past three decades, the subject of relations between people and other animals has become a respectable area of research: "anthrozoology" crosses a wide variety of academic disciplines, including anthropology, art and literature, education, ethology, history, psychology, sociology, philosophy, and human and veterinary medicine. In convergence to this research field the paper is going to discuss two emergent themes from the Sociosemiotic perspective:

Harry Truman once said: "If you want a friend in Washington, get a dog¹."

In modern Western societies pets are everywhere. In modern cities there are millions of pet dogs, cats, birds, fish, rabbits, snakes, and monkeys while modern economy includes a vast service industry that provides veterinary care, food, breeding, and assorted accessories. Looking through the historical evolution of mankind it becomes obvious that without the possession of the domesticated animals, no considerable progress in civilization could have been achieved. This became possible through artificial selection, which is the selection of advantageous natural variation for human ends and it is the mechanism by which most domestic species evolved. A fact to be considered is, as Sheppard (2003: 511) affirms, that: "Pets are not part of human evolution or the biological context out of which our ecology comes. They are civilized paraphernalia whose characteristic combination and accommodation is tangled in ambiguous tyranny. Although looked upon with affection, even modern pets are property that is bought, sold, put down and neutered."

Pets are commodities that many people use, like other consumer goods, as a means of constructing identities, although they are also considered members of families and serve as companions providing considerable emotional attachments and satisfactions. It is likely that because of the social and economic conditions many middle-class people make substantial emotional investments in their relationships with animal companions. The case is that humans not only attribute various mental states to one another but there is an irresistible primate tendency to generalize these attributions to pets and other animals. On one side, anthropomorphic thinking enables animal companions' social behavior to be construed in human terms. On the other side, anthropomorphism constitutes an evolutionary selection pressure which has defined the appearance, anatomy, and behavior of companion animal species.

The research is discussing mainly the U.S pet-keeping culture for methodological reasons, firstly because it's a phenomenon that is related to modern U.S society; secondly there are many scientific studies related to various aspects of pet-keeping in this country; and thirdly, there are statistical data from different institutions related to pet ownership and the social, personal and economic dimensions of this practice. As it will be shown in the process this paper will focus mainly on dogs and cats, as they constitute the vast majority of pets in the modern U.S. Addi-

¹ 50 famous quotes about dogs. (2014) <http://dogtime.com/25-famous-quotes-about-dogs.html>

tionally, the bibliography examined is almost exclusively based on case study results relying on answers provided by pet owners whose pet is usually a dog or a cat. The paper constitutes an overview and it is divided in two parts: the study of the meaning(s) and the function(s) of companion animals in modern U.S society.

1. Companion animals' mediation between nature and culture

1.1. The human/pet relationship: The sign of the pet

What kind of meaning is connected to *the pet world*² and by what kind of mechanisms?

For Gottdiener and Lagopoulos (1986: 2–3):

Semiotic studies sign relating to the recognition of the social and natural environment of an individual and of his/her internal world.[...]The universe of signs includes: the non-physiological part of perception; conception; scientific modes of discourse; and the value systems, or the socially constituted world views of social subjects, which are in function of social interaction. [...] Material objects are vehicles of signification, so that the symbolic act always involves some physical object as well as the discourse on it.

Gottdiener and Lagopoulos (1986: 8) also indicate that: “Conceptual stimuli in the environment play a more fundamental role as physical forms are assigned certain significations.” In this case the material objects or physical objects are companion animals (or pets) which act as stimuli as they have become symbols. Every companion animal (or pet) is transformed, at the level of denotation, into a signified of his own function, as well as of another function which is symbolic, it signifies on a second level also, that of connotation. Connotative codes are social products produced by groups and classes involved in practices related to companion animals.

The present socio-semiotic approach is a materialist inquiry into the role of the ideology related to companion animals in everyday life seeking to account for the articulation between semiotic and non-semiotic social processes in the ideological production and conception of companion animals. The organization of companion animals handling is a social product and the production of companion animals is governed by social processes characteristic of social formations that involve non-semiotic as well as semiotic processes, because social practices mold and interpret companion animals according to codified ideology. Thus, a socio-semiotic analysis at the level of production of companion animals, involves identifying the role of connotative and denotative codes of mediation of companion animals productions. It becomes clear that the pet world is the end result of the intersection between non-semiotic and semiotic processes, which are mediated through companion animal ideologies and it can be approached by an inquiry of the semiotic conception of companion animals by the socially stratified groups of synchronic users. A socio-semiotic analysis of the pet world therefore consists of a series of combined aspects of study related to the decomposition of companion animal or pet sign according to the model of Hjelmslev, in an attempt to identify explicitly the social languages of ideological systems and the non-semiotic environment (Gottdiener and Lagopoulos 1986: 16–17).

From this methodological approach a socio-semiotic analysis of a pet sign system should be constituted by cultural research to document the *form and substance of content*:

Substance: attention will be given to historically and culturally established signification related to companion animals, in other words the evolution of pet-keeping in western societies.

² Reference to Paul Sheppard's article (2003) with the same title.

Form: considerably case study research is necessary to document the codified ideology structuring the signifiers of companion animals. At this point it has to be mentioned that to establish the codes the research used a corpus of published texts from various disciplines – anthropology, sociology, psychology, cultural, consumer, medical and veterinary studies – examining the discourse of pet owners as appeared in studies and surveys. This task at this point it cannot be considered exhaustive.

On the other hand, observational data should be collected on *both the substance and form of the expression*:

Substance: description of material companion animal fauna invested by signification should be obtained, in this case of cats and dogs, which serve as companion animals.

Form: attention should be given to the specific companion animal elements which are the vehicles of signification, physical appearance, breed, species, etc.

The conception of companion animals is filtered through and finally shaped by a cultural grid. This grid is composed of a set of semantic components, each one of which is a specific manner of approaching and apprehending companion animals. The semantic components of this grid used to apprehend companion animals, constitute a semantic code. The codes which belong to the same general semantic field constitute a code set.

The research has indicated 10 codes grouped in 5 code sets:

Economic codes

The code of pet-care is used to make reference to expenditure animal keeping costs.

Social codes

The code of social support is used to make reference to the subject's sense of receiving certain types of social support from his pet.

The code of social status is used to make reference to the connection of the owner's pet with social status.

The code of property is used to make reference to legal or pet-welfare aspects of pet-keeping.

The code of control is used to make reference to behavioral aspects of the pet owned, as perceived by the owner.

Functional codes

The code of companion animals (pet-code) is used to make reference to the function of pets to serve as company to their owner.

Personal codes

The aesthetic code is used to make reference to physical appearance of the pet animal related to owner's aesthetic preferences.

The experiential code is used to make reference to experiences related to the interaction with the pet animal

The code of pet anthropomorphism is used to make reference to the pet animal, as bearer of human characteristics, as a person.

Taxonomic codes

Taxonomic species code is used to make reference to the species of the pet animal, in this case a cat or a dog.

1.2. Non-semiotic material practices related to companion animals: The evolution of pet-keeping

There are no pets in nature; an animal only becomes a pet by the human owner's choice. Thus, a "pet" is an artificial category of human conception. The *Oxford English Dictionary* records the earliest use in reference to a pet animal in 1539 (Walker-Meikle 2012: 2).

Pet-keeping appears to be a remarkable relationship between humans and animals, for the pet is often allowed into personal spaces, lives in physical proximity with its owner, often en-

joys of luxury food and it is decorated with special accessories, while nothing is asked but to provide companionship. Pet-keeping as a practice was established in the middle Ages. In the nineteenth century pet-keeping reveals a system of control related to the arrangement of the imaginary in ordinary life adapted to the bourgeois expectations of self. As Sheppard (2003: 512) discusses: “Domestic animals were “created” by humans by empirical genetic engineering over the past ten thousand years. [...] They and all captive animals are like organ transplants: healthy for us but cut out of their own organic fabric. [...] Pets, being our own creations, do not replace that wild universe.”

The modern pet dog constitutes a clear example: the eating habits, the walking time, the sleeping place and the grooming of the animal are totally under human control. Its health and its wellbeing through veterinary care depend entirely on the owner, as well. Pet dogs are provided with human names, clothing, grooming and health care to a level that owners start to see them as quasi-human, as members of the family in the modern domestic environment. The modern pet dogs don't have wild origins; they have always been tamed animals for being a product of breeding. In modern society a companion animal often constitutes an impulse item as the number of animal images accessible to viewers across the world beyond boundaries of language and culture through mass media and advertizing has drawn attention and reshaped our conception of animals.

1.3. The semiotic perspective of pet-keeping.

1.3.1. The key aspect of pet-keeping culture: Pet anthropomorphism

Humans use animals to symbolize and dramatize aspects of their social experience and individual fantasies, because they can simplify the narrative to produce effective allegorical meaning. In the mass media culture globalized community of today photography, film, television and Internet only have transformed the way they are told.

For Asquith (1984: 138), anthropomorphism in the context of animal behavior means: “the ascription of human mental experiences to animals”. Normally an animal, with certain physical and behavioral characteristics, must be singled out as a promising prospect for anthropomorphism. The distinctive mark of the animal is self-locomotion; they are not just one symbol system out of many, for Daston and Mitman (2005: 13): “they are symbols with a life on their own.”

As Serpell (2005: 123) suggests: “anthropomorphism appears to have its roots in the human capacity for so-called reflexive consciousness, which is the ability to use self-knowledge to understand and anticipate the behavior of others.” Thus, for Michell (2005: 102): “anthropomorphism involves claims the centrality of human concepts and abilities to classify behaviors across ontological categories.”

In the semiotic perspective of gestural communication Greimas (1987: 31–34) indicates:

Since the human body, as signifier, is treated as configuration is normal to expect that its mobility will be considered as mainly creating positional gaps and this polarization of movements will end up in the parallel categorization of contents. In addition to the fact that on the plane of content this valorizes what are commonly called *attitudes*, at the expense of gestures, we have also accounted for the semiosis that characterizes communicative gestuality. This consists in establishing a correlation between a phemic category belonging to the plane of expression and a semic category at the plane of content.[...] The acknowledgement that the correlation between the categories of expression and those of content remains constant within a given cultural context enables us to set out our observations on communicative gestuality by starting from considerations regarding content, and not, as would normally be the case for any other semiotic text, from the plane of expression.

For Greimas (1987: 38): “The presence of the animal world and the narrative sequences of taming make it possible to interpret this form of mythical gestuality, as an archaic universe still surviving in modern times”. In this case the research is focusing on the gestural programs of pet keeping investigating the semiotic models and structures responsible for the attribution of meaning to certain pet animal behavior while interacting with their owners. Greimas (1987: 45) concludes that: “Considered from the point of view of cultural projects, the different gestural programs seem to be closed discourses whose content analysis can explicate only a particular type of narrative structure. They can be represented as models of a practical or mythical knowing-how-to-do whose organization could account for a certain mode of existence of so-called economic and cultural structures.”

Thus, the conception of the gestural communication of pet animals perceived by humans indicates a semiotic model, an anthropomorphic code that could be named, code of pet anthropomorphism. This code seems to be the result behind the interpretation of the behavior of the pet animal and its taming in cultural terms by a semiotic process. From the socio-semiotic point of view, anthropomorphic codes in the conception of companion animals are specific, scientifically accessible claims of similarity between humans and nonhumans. Thus, there must be substantiated by evidence that there are similar structures responsible for generating meaning. To this hypothesis further specifically focused socio-semiotic case study is required.

Most authorities now agree that pets are serving as a form of social support. Cobb (Serpell 2005: 125) defined social support as “information leading the subject to believe that he is cared for and loved, esteemed, and a member of a network of mutual obligations.” Thus, the socially supportive potential of pets encoded in the social support code in the discourse of pet owners should therefore underlie on the ability of the animal to produce meaning by behaving in ways that make their owners conceive that the animal demonstrates care, love, high esteem towards them and depends on them for care and protection. It becomes apparent that the human-pet relationship serves primarily for the transfer or exchange of social meaning between people and animals than a rather economic or utilitarian function.

As Serpell (2005: 127) comments:

Bonas's study (Bonas, McNicholas and Collis 2000: 209–236) clearly suggests that her subjects had no difficulty describing and evaluating their nonhuman companions using precisely the same relational parameters as those developed and used to describe relations with humans. By implication, then, these people must have interpreted and evaluated the various behavioral signals of social support they received from their pets as if they were coming from fellow human beings.

This leads to the conclusion that the anthropomorphic code is closely related to the experiential code of pet owners practicing pet-keeping in modern world and to the social support code from the same individuals as a result of the interaction with their pets. For Hirschman (1994: 626), as the urban household is primarily intended as a human habitat, pet animals are permitted within it to the extent that they conform to behavioral practices and respect boundaries regarded from the owner as positive and acceptable. This is encoded in the control code that is used to make reference to the conception of the behavioral aspect of the animal's presence in human habitat.

For Albert and Bulcroft (1988: 544) pets are an economic paradox because they do not do useful work, and they cost substantial amounts of money and time from their owners. The code

of pet-care is used to make reference to economic and other type of cost – time for example – required from the pet owner as responsibility related to the animal.

Regarding the functional code of companion animals (pet code), Hirschman (1994: 620) asserts that:

[...] the majority of animals act as companions to their human owners.[...] Animals may act as friends and partners to their owners. They may serve as children or as child substitutes for childless couples. Finally, animals may act as extensions of the consumer's self, case in which the owner projects his or her own personality onto the animal and absorbs the animal's nature into himself or herself.

Albert and Bulcroft (1987) confirm that *pet attachment*³ is highest among single, divorced, widowed, and remarried people as well as among childless couples, newlyweds, and empty-nesters, while pet anthropomorphism is high among single, divorced, remarried people and childless couples. Albert and Bulcroft (1988: 550) also affirm that pets tend to be viewed as family members by people who live in the city and pet ownership, the roles and functions of pets vary over the life cycle and by family type.

1.3.2. A striking issue: The pet personality

The Oxford English Dictionary on-line defines the word *pet*:

1. (Noun): A domestic or tamed animal or bird kept for companionship or pleasure,
2. (Verb): Stroke or pat (an animal) affectionately⁴.

It is estimated that the total number of pets owned in the U.S is that of 396 from which the cat population is of 95.6 millions (24%) and the dog population is of 83.3 millions (21%)⁵. Apparently becomes reasonable to believe that the cat and the dog are the protagonists of the pet world in the U.S.

The domestic dog (*Canis Lupus Familiaris*) is a member of the *Canidae* family of the mammalian order *Carnivora*.

The domestic cat (*Felis Catus*) is a member of the *Felidae* family of the mammalian order *Carnivora*.

The human ability to attribute meaning to certain animal behavior and physical appearance, especially in the case of pets, conditions our conception at a connotative level. In this way certain animal elements, which are the vehicles of signification, tend to generate semantic structures, which constitute aesthetic and control codes in pet discourse, which are culturally regulated. The relation of these codes with the code of pet anthropomorphism, as described previously, constitutes the concept of the so-called *pet personality*. At the level of material processes related to the production of pets, anthropomorphic selection in favor of physical and behavioral traits that facilitate the attribution of human mental states to animals has significant impact on the anatomy, the physical appearance and the behavior of pets. Results of a study (Fratkin and Baker 2013) indicated that people attribute different personality characteristics to dogs based solely on physical characteristics (coat color and ear shape) and that there is some evidence (Delgado, Munera & Reevy 2012) that human perception of coat color is an indicator of domestic cat per-

³ Albert and Bulcroft (1987: 547) define pet attachment as an underlying dimension of people's feeling toward their pets that nine of the items used in the survey assessed and it was revealed by factor analysis and inter-item correlations of the data.

sonality.

The combined aspects of the studies revised indicate a close relationship between the aesthetic and the control code with the experiential and social support codes that reveal the dimensions of the encounters with an animal that fulfills the companion animal owner's expectations and produces positive feelings. The anthropomorphic code seems to be the core code in the structure of this code system, fact that is also reflected in the content of the surveys questions. As a general overview the results for the average middle class urban pet owner of a dog or a cat can be summarized in this scheme of codes:

The pet code system	
Not pet VS pet	Companion animal code
Negative VS positive	Aesthetic code
Not controlled VS controlled	Control code
Not anthropomorphic VS anthropomorphic	Code of pet anthropomorphism
Negative VS positive	Experiential code
Negative VS positive	Code of social support

In this scheme the positive poles of the binary relationships underlying in the codes used by pet owners in pet related oral discourse respond to the concept of the pet in modern society. Regarding the code of pet-care, low importance is given to costs and expenditures from the pet owners, thus it does not appear playing a significant role. The code of social status is related to breeds and other types of pet functions, as pet contests and breeding activities, as well as it concerns upper class pet owners, thus at this point its appearance does not play an important role, requiring specific focused research to detect the structure of the system describing these phenomenons.

2. The commodification of animals in market industry: The case of the pet culture⁶ in the U.S

Statistical data provided by American Pet Products Association (APPA) indicate that 140 million U.S. households own a pet and APPA estimates pet spending will reach \$55.72 billion this year⁷. Pets in modern U.S. society seem to be no longer a part of wild nature. They are a middle class commodity⁸ that everyone wants and they are humanized to the point that they have the same food, clothes and beds as humans. As Mullin (1999: 215–216) affirms, pets are used like consumer goods, as a means of constructing identities although they serve as companions providing considerable emotional attachments and satisfactions and are also often considered members of families. Companion animals as facilitators of social interactions increase self-defining situations, as the self is a social construction built on the information derived from a person's social relationships. However, the connection between companion animals and the owner's self concept is direct, involving a material practice at the non-semiotic level, and mediated at the semiotic level of connotation, involving the code system for generating meaning previously

⁷ Pet Industry Market Size & Ownership Statistics. (2014).

http://www.americanpetproducts.org/press_industrytrends.asp(last accessed: 25 June 2014)

⁸ Reference to the term introduced by Marx (1976: 125): "The commodity is, first of all, an external object, a thing which through its qualities satisfies human needs of whatever kind. The nature of these needs, whether they arise, for example, from the stomach, or the imagination, makes no difference."

discussed. Thus, for Sanders (1990): “owners usually define their pets as “persons” with whom they share lasting, intimate, and emotionally involving relationships”.

In the consumer society the companion animal function fulfils itself in the precision of its relationship to the real world and to human needs, while transcending its main function in the direction of a secondary level within the universal system of signs. From this semiotic process the companion animal nature results dominated, as the semiotic system is constantly converting it into culture. Thus, the pet being the object merely of needs and of the satisfaction of needs has become an object of consumption external to the relationship that it signifies. By this process the relationship is no longer directly experienced it is transformed into a sign and thus consumed. In this system the signified is the void of this relationship, the relationship that is lacking. Pets constitute the signs of the absence of nature in modern life; while at the same time constitute connotations of the absence of relationships in the consumer society. Pets are used for the development and definition of consumer’s sense of self in an attempt to overcome the sense of self-emptiness by creating a shared meaningful relationship.

A research (Gosling, Carson & Potter 2010) published in the journal *Anthrozoös* presents scientific evidence that there are personality differences between “cat people” and “dog people”, revealing “a widely held cultural belief that the pet species – dog or cat – with which a person has the strongest affinity says something about the individual’s personality”.

As a customized animated commodity in consumer culture, the pet provides to the consumer comfort, protection, love, health, companionship, and a self definition which can be bought, sold, or traded. A clear example from a modern society, with a lot of similarities with the U.S society, is given in a published study((King, Marston and Bennett 2009) regarding the ideal Australian pet dog, where the researchers indented to identify what constitutes an ideal dog in the present day based on a number of behavioral and physical characteristics. The results indicated that for Australian people is important that the companion dog is being medium sized, short haired, de-sexed, safe with children, fully housetrained, friendly, obedient and healthy; to come when called, not to escape from their property, to enjoy being petted and to display affection to their owners. It becomes clear from the results of this study that the closer model to the ideal Australian pet dog is a fully controlled robot-dog.

Many unexplored aspects of the ideology of pet-keeping in any modern culture may be accessible via socio-semiotic analysis. There is a tremendous amount of texts devoted to pets to be utilized within a consumer behavior context, while Internet, television and print advertisements present a variety of pet-related products which encode cultural beliefs about the meaning of pets and promote norms related to their care. Pets appear regularly in motion pictures, television programs, and, especially, in children’s animation programs. A systematic socio-semiotic analysis of these texts would reveal important cultural concepts related to companion animals in the modern world.

CULTURAL SEMIOTICS

SEMIOTIK DER KULTUR ALS ÜBERSETZUNG VON SCHRIFTZEICHEN BEI YOKO TAWADA

Aglaia Blioumi
National and Kapodistrian University of Athens, Greece
baglaia@hotmail.com

Abstract

Literary essays are not just objectification of real cultural artifacts, but also performances of culture. But how does culture become literarily organized on the levels of expression and contents? What happens when a topic becomes the meeting of foreign and own culture? Striking examples of such cultural overlaps are the literary essays of the Japanese German author Yoko Tawada. The previous article investigates how, for Tawada, elements of Japanese culture are translated for the German reader through the rendering of Japanese ideograms; how commonalities and differences are expressed literarily through the function of the alphabet and the ideograms. My thesis thereby is that Tawadas constant desemanticizing is set in the writing in order to avoid a static concept of culture.

Literarische Texte sind nicht nur Objektivationen realer kultureller Artefakte, sondern performieren auch Kultur. Wie wird jedoch Kultur auf der Ausdrucks- und der inhaltlichen Ebene literarisch dargeboten? Was passiert, wenn das Thema der Literatur die Begegnung der fremden mit der eigenen Kultur ist? Ein eklatantes Beispiel für solch kulturelle Überlappungen sind die literarischen Essays der deutschsprachigen Autorin japanischer Herkunft Yoko Tawada, da in ihren Schriften das „Fremde“ und das „Eigene“ zum Gegenstand ihres Schreibens wird.

Die Problematisierung des „Fremden“ und des „Eigenen“ wird nicht nur auf der konnotativen Ebene, sondern auch auf der denotativen Ebene konfiguriert. Daher werde ich im Folgen-

den untersuchen, wie bei Tawada Elemente der japanischen Kultur für den deutschen Leser durch die Wiedergabe der japanischen Ideogramme „übersetzt“, wie Gemeinsamkeiten und Unterschiede durch die Funktion des Alphabets und der Ideogramme literarisiert werden. Schließlich, wie die Funktion des den Texten inhärenten semiotischen Systems zu beschreiben ist. Meine These ist dabei, dass durch die Wiedergabe der japanischen Ideogramme und die kulturellen Übersetzungen der Wörter, Desemantisierungsprozesse in Gang gesetzt werden, um einen statischen Kulturbegriff zu unterlaufen.

1. Hommage an Paul Celan

Im Essay *Die Krone aus Gras. Zu Paul Celans ‚Niemandrose‘* (Tawada 2007: 63-84) versucht Tawada den Zugang des Dichters Paul Celan zum Japanischen zu beschreiben. Bereits in Japan und ohne der deutschen Sprache mächtig zu sein, war sie von den japanischen Übersetzungen des Dichters beeindruckt. In ihrem bekannten Essayband *Talisman* behauptet die Protagonistin, dass es nicht genüge zu behaupten, dass Celans Gedichte übersetzbar sind, sondern, dass sie „ins Japanische hineinblicken“ (Talisman, 121). Daher unternimmt sie in ihrem Essay *Die Krone aus Gras* eine Art literarische Übersetzung, die Celans Gedicht *Zweihäusig, Ewiger* interpretiert. Ihre Profession als Übersetzerin führt sie dazu, im Wort des Gedichtes „Bettstatt“ zweimal den Signifikant des „Doppel-T“ zu registrieren. Beim Übersetzen ins Japanische erkennt sie, dass ihr dieses Wort deswegen optisch aufgefallen war, weil im japanischen Wort für Rose 薔薇 „bara“ ebenso zweimal das „Doppel-T“ steht. Die Protagonistin erklärt, dass das Wort aus zwei Ideogrammen besteht und jedes von ihnen im obersten Teil dasselbe Radikal hat, das wie ein Doppel-T aussieht (Die Krone aus Gras 2007: 66).

In Bezug auf die Schreibintention Tawadas ist darauf hinzuweisen, dass japanische Grapheme in einem deutschen Text beiden Sprachen und Kulturen näher rücken, sodass dem Mythos „Japan als die absolute Fremde“ entgegensteuert wird. Dieses Näherrücken im Übersetzen der japanischen Schrift ins vertraute Alphabet des Lesers überwindet das Fremdartige der Schrift. Grenzziehungen werden kulturell aufgelockert, da die Trias „Sprache – Schrift – japanische Kultur“, die als abgeschlossener Kulturkreis im europäischen Bewusstsein eingegangen ist und die absolute Fremde konstruiert hat, aufgelockert wird (Schaffers: 299-301). Nicht zufällig erörtert Tawada in Bezug auf Grenzen, dass während in Celans Gedicht *Chymisch* die Alchemie durch die Vermischung von Mineralien ein Wunder versucht, in *Die Krone aus Gras* durch Grenzüberschreitung quasi eine andere Art von Wunder vollbracht wird:

Ein Stein, der im Bereich der Mineralogie bleibt, kann nicht blühen. Aber wenn er in die Botanik eintritt, kann er sich auftun wie eine Rose. (64)

An anderer Stelle erörtert Tawada, dass Michel Foucault die Botanik des 17. und 18. Jahrhunderts als den Versuch charakterisiert, die betrachteten Dinge durch ihre geometrische Form in die Nähe der Wörter zu rücken (Tawada 2007: 65). All diese Ausführungen münden schließlich darin, dass die Botanik in die Richtung der Symbolik der Poesie gerückt wird, da durch sie Grenzen aufgehoben werden und sogar ein Stein verlebendigt wird. Semiotisch kann hinter der Substitutionsmetapher folgende Homologie (Johansen 2003, 3-4: 315-329) konstatiert werden:

Botanik :: Stein
Rose :: Leben

Offensichtlich wird im Zuge dieser Metapher auf eine Opposition – die semantisch unpassenden Prädikate „Stein“ und „Leben“ – durch den Kontextwechsel der Fiktion, die eine Ähnlichkeit zwischen Quelle (Stein) und Ziel (Leben) herstellt, verwiesen (Sonesson 2003, 1-2: 25-37)¹. Die Funktion der Fiktion besteht schließlich darin, durch Abstraktion gemeinsame Eigenschaften herzustellen (Rozik 2003, 1-2: 93-107)².

Dieser bewegliche Umgang mit Grenzen wird an anderer Stelle des Essays auf den Akt der Übersetzung übertragen, was schließlich im Überschreiten von Kulturgrenzen mündet. Dabei wird das Beispiel mit dem „Doppel-T“ entsprechend im Wort „Bettstatt“ und dem Ideogramm (bara) auf den Punkt gebracht:

Man kann meistens die Formen, die man im Schriftbild eines Gedichtes entdeckt hat, nicht übersetzen. [...] In der Übersetzung blüht nicht immer an derselben Stelle dieselbe Rose wie im Original. Aber sie blüht. Sie blüht manchmal an einer unerwarteten Stelle und macht auf eine Form aufmerksam, die sonst weiter unter der Rose stehen würde (69).

Mit anderen Worten wird die Übersetzung zu einem third space (Bhabha 2000: 57)³, der sprachliche und kulturelle Metamorphosen hervorbringt, durchgeführt. Übersetzungen werden somit zu kulturellen Knotenpunkten. Die Gemeinsamkeit des obigen Beispiels besteht darin, dass über die Übersetzung der japanischen Schriftzeichen und die Wiederholung des Sinns von „Rose“ eine auffallende, morphologische Symmetrie („Doppel-T“) sowohl im Alphabet also auch in den japanischen Schriftzeichen hergestellt wird, die im Zuge der Übersetzung zu einem flexiblen Umgang mit Äquivalenzen führt. Das bedeutet, dass zwar eine Sprache und Kultur nicht 1:1, also der eine Primärcode in einen anderen übersetzt werden kann, aber im Kontextwechsel ein kommunikativer, kulturübergreifender Gewinn gesehen wird. Ähnlich wie im alltäglichen Sprachgebrauch die Kreation neuer Zeichen darauf beruht, dass wenn einmal über ein gemeinsames sprachliches Zeichensystem verfügt wird, es recht einfach ist, ständig neue Konventionen festzulegen, z. B. durch Sinnzuweisungen neu erfundener Wörter (Adamzig 2004: 22), so macht hier die Ich-Erzählerin darauf aufmerksam, dass sie durch die Übersetzung eines fiktionalen Textes neue kulturelle Bedeutungen zum Vorschein bringt.

Ähnlich verhält es sich auch im nächsten Absatz:

„Es ist Gras darüber gewachsen“: Das ist ein verbreitetes Bild für die Vergessenheit. Unter dem Boden, der mit Gras bedeckt ist, liegen die Toten. Das Ideogramm, das „begraben“ bedeutet 葬, enthält auch das Radikal „die Krone aus Gras“.

Die „Krone aus Gras“ ist also ein Radikal, das im Japanischen „Gräser-Typen“ zum Ausdruck bringt, es ist sogar auf der Inhaltsebene fast identisch mit dem deutschen Spruch, was durch die Übersetzung offenkundig wird. Die Similarität, die dadurch gestiftet wird, untergräbt den Mythos der „absoluten Fremde Japans“ und enthüllt überraschenderweise Gemeinsamkeiten, dort wo sie niemals vermutet worden wären, nämlich in der Gegenüberstellung der Schriftzeichen.

¹ Ähnliche Beispiele solcher Metaphern siehe Sonesson, (2003).

² Für den Aspekt der Konvention und der Abstraktion siehe Rozik, (2003).

³ The third space ist als ein symbolischer Raum zu verstehen, als eine Kontaktzone, wo die selben Zeichen „neu belegt, übersetzt, rehistorisiert und gelesen werden können“. Bhabha, 2000.

Im Grunde genommen ist die Protagonistin auf stetiger Spurensuche im Sinne Derridas (1976, 32)⁴, denn erst durch das Spiel der Differenzen, die im obigen Beispiel auch kulturell bedingt sind, – „Es ist Gras darüber gewachsen“ ist ein deutscher Ausdruck, und das Radikal ist eben japanisch – werden Grapheme als Spuren aufgefasst, die wiederum gegenseitige Spuren aufweisen. Darüber hinaus ist offensichtlich, dass die Zuweisung des Signifikanten auf das Signifikat völlig aufgelöst wird. Es wird ausschließlich auf der visuellen Ebene der Schrift fokussiert, nämlich das abgebildete „Doppel-T“ sowohl im Alphabet als auch im japanischen ikonographischen Schreibstil ist dafür verantwortlich, dass etwaige Assoziationen bzw. Verschiebungen und Verweise zu interkulturellen Gemeinsamkeiten führen.

In Bezug auf die Sprachreflexionen Tawadas scheint sie Belege für frühere Auffassungen zu liefern. In ihren Poetik-Vorlesungen (Tawada 1998, 30) heißt es, dass der Buchstabe etwas Rätselhaftes habe, „weil er kein Zeichen ist, das für ein Signifikat steht. Er ist weder ein Abbild noch ein Piktogramm.“ Er ist aber ein Graphem, mit dem hier experimentiert wird, sein jeweiliges Signifikat erfährt er über die Zuordnung zu anderen sowohl alphabetischen als auch ideogramatischen Signifikanten.

Die Suche nach solchen Spuren auf visueller Ebene vergegenwärtigt Gemeinsamkeiten, die schließlich nicht nur den Mythos der „absoluten Fremde“ untergraben, sondern statische Kulturbegriffe, die Kulturen als abgeschlossene Kreise betrachten, als obsolet erklären. Die Tatsache, dass Tawada dies auf der Grundlage der Übersetzung japanischer Schriftzeichen exemplifiziert, stellt den besonderen ästhetischen Reiz ihres Schreibens dar.

Man sollte jedoch nicht vergessen, dass es sich um literarische Essays handelt, was bedeutet, dass es sich um ein Schreiben handelt, das aus dem Wechselspiel zwischen Fiktion und Wirklichkeit hervorgerufen wird. Konkret geht es bei Tawada um eine metasprachliche Wirklichkeit, da sie in den Essays die Gedichte Paul Celans zu interpretieren versucht:

Übrigens ist „Konjugation“ gleichzeitig ein biologischer und ein linguistischer Begriff. *Ich grabe, du gräbst, und es gräbt auch der Wurm, und das Singende dort sagt: Sie graben.*⁵ Die Konjugation ist hier keine trockene Aufgabe für Sprachschüler, sondern eine musikalische Methode der Dichtung. Sie bringt wie in der Musik die Wiederholung mit Variationen hervor (Die Krone aus Gras:75).

Es ist offensichtlich, dass hier die metasprachliche Funktion die poetische verdrängt. Die Wiederholung, von der die Rede ist, bestätigt, dass das *Prinzip der Äquivalenz*, das durch die Similarität der Konjugation „und“ hervorgebracht wird, ein poetisch wirksames Mittel ist. Im Wortlaut Roman Jakobsons würde das heißen, dass das „und“ ein eigentümliches grammatisches Kennzeichen ausmacht, das als *vertikale Similarität* (Jakobson 1979: 254) bezeichnet werden kann, da seine Wirkung auf der syntagmatischen Ebene zu registrieren ist. Essayistisches Interpretieren funktioniert ähnlich wie bei der Beseitigung von Kommunikationsproblemen, denn „nur durch explizites Verbalisieren kann über den kognitiven Bereich der emotive Inhalt vermittelt werden“ (Batsalia 1997:91). Dass jedoch die Sphären der Metakommunikation und der Poesie nicht an allen Stellen so deutlich voneinander getrennt sind, wurde am Beispiel mit der „Rose“ und des „Steins“ gezeigt, das metaphorisch ausgedrückt wurde. Insofern besteht der

⁴ Nach Derrida ist die „Spur“ das Simulacrum eines Anwesens, das sich ständig auflöst und verschiebt. Vgl. Derrida, 1976.

⁵ Tawada bezieht sich hierbei auf die Ausgabe: Allemann, Beda/Reichert, Stefan (Hrsg.): Celan, Paul: Gesammelte Werke in fünf Bänden. Bd. 1, Frankfurt a.M. 1983, 211.

besondere ästhetische Reiz im Schreiben Tawadas metaphorisch in der *Äquivalenz der Funktionen*, da sich sowohl die poetische als auch die metasprachliche Funktion gegenseitig durchdringen. Die *ästhetische Übersetzung der Schriftzeichen* ist dabei ein besonderes Spezifikum ihres Schreibens, das die literarische Qualität unterstreicht.

2. Übersetzung der einen Kultur in eine andere?

Wie übersetzt man eine Kultur? Können *Mentefakte*⁶ (Posner 2003: 49) 1:1 übersetzt werden? Wie funktioniert ein Äquivalent zwischen zwei kulturellen Primärkodes? Bei Tawada geschieht dies über die literarische Übersetzung der Schriftzeichen hinaus und das explizite Verbalisieren des kognitiven Bereichs, zusätzlich durch die Übersetzung von Aspekten des kognitiven Bereichs, die mit den denotativen Inhalten japanischer ins Alphabet transkribierter Wörter korrelieren. Im Essay *Baumkuchen* meint zum Beispiel der Ich-Erzähler:

Die Fremdwörter aus dem Deutschen, die auch heute noch sehr häufig im Alltag verwendet werden, haben jedoch wenig mit Musik, Philosophie oder Literatur zu tun. Das Wort „Arbeit“ zum Beispiel, das manchmal abgekürzt „Bait“ ausgesprochen wird, bedeutet Stundenjob. Japanische Studenten bezeichnen das, was deutsche Studenten „Job“ nennen, als „Arbeit“ (122).

Die metasprachlichen Eingriffe Tawadas gelten dem Explizieren des Fremdwortes „Bait“. Dies ist zum einen ein eklatantes Beispiel dafür, dass sowohl denotative als auch konnotative Bedeutungen durch (kulturelle) Konventionen festgelegt sind⁷, zum anderen können *Mentefakte* nicht 1:1 übersetzt werden, auch nicht bei der Übernahme von Fremdwörtern. Dies entspricht Tawadas Sprachreflexionen nach denen Übersetzungen *Metamorphosen*⁸ sind, daher performiert die deutsche Bedeutung von „Job“ als Geldverdienen bzw. vorübergehende Beschäftigung⁹, ihre theoretischen Sprachreflexionen zur Übersetzung, indem die unterschiedlichen affektive Inhalte des Signifikats „Arbeit“ vorgeführt werden.

Die literarische Übersetzungsarbeit Tawadas besteht in erster Linie darin, die Korrelation des Begriffs zwischen sozialem Umfeld und *Ist-Zustand*, demzufolge die Korrelation des sozialen Umfelds und des kognitiven, assoziativen und emotiven Bereichs zu verbalisieren, um dadurch kulturelle Unterschiede evident zu machen. Interessanterweise belegt Batsalia (1997: 54) aus linguistischer Sicht, dass das letztendlich realisierte Lautzeichen jenes Sprechers der Korrelation des sozialen Umfelds mit dem kognitiven, assoziativen und emotiven Bereich entspringt. Die Tatsache aber, dass hier dieser *Ist-Zustand* metasprachlich über die Fiktion beschrieben wird, unterminiert dann doch die Zusammenhänge. Dem deutschen Leser des Essays wird bewusst, dass eigenkulturelle Elemente des Zusammenhangs zwischen sozialem Umfeld und Kognition, Assoziation bzw. Emotion in anderen Kulturen beweglich transferiert werden können, auch wenn es sich um die Übernahme desselben Signifikanten handelt. Man könnte metaphorisch behaupten, dass eine *kulturelle nicht-Äquivalenz* angestrebt wird.

Zweifelsohne klingen hier Elemente jener postkolonialen Theorie der *Mehrfachkodierungen* (Suppanz 2003: 27) an, nach der die Abhängigkeit der Zuschreibungen vom jeweiligen Kontext determiniert wird. *Kultur* ist danach dynamisch aufzufassen, indem binnengesellschaftli-

⁶ Als Mentefakte sind die mentalen Kulturen jeder Gesellschaft zu verstehen, die das Verhalten der Individuen in einer Gesellschaft bestimmen.

⁷ Aus linguistischer Sicht siehe Batsalia 1997, 52.

⁸ In Tawadas Essay *Das Tor des Übersetzers oder Celan liest japanisch* aus dem früheren Band *Talisman* heißt es: „Die Übersetzung ist nicht Abbild des Originals, sondern in ihr bekommt eine Bedeutung des Originals einen neuen Körper“ (139).

⁹ Nach Wahrig drückt das Lema „Job“ eine vorübergehende Beschäftigung, Stellung, Gelegenheit zum Geldverdienen aus, siehe: Wahrig. Deutsches Wörterbuch, Gütersloh: Bertelsmann 61997.

che und transnationale Aspekte berücksichtigt werden. Als binnengesellschaftlich ist das soziale Umfeld zu bezeichnen und als transnational Austauschprozesse und Transfers – wie eben jener Fremdwörter – innerhalb verschiedener Netzwerke, die wiederum die Reduktion der *Kultur* auf „Nationalkultur“ und territoriale Grenzen unterlaufen. Der *kulturellen nicht-Äquivalenz* Tawada liegt demzufolge ein dynamischer Kulturbegriff zugrunde.

Diese subversive Haltung gegenüber dem *Ist-Zustand* geht an anderen Stellen des Essays bis auf die Lautebene.

Das deutsche Wort, das meiner Meinung nach in Japan am häufigsten in den Mund genommen wird, ist „Baumkuchen“. [...] Vielleicht liegt es an dem Vokal „i“, warum die Lakritzen, [...] nicht in Japan eingewandert sind. Bei ihnen ist nämlich der Vokal „i“ zu stark präsent. Dagegen haben die japanischen Süßigkeiten immer ein „a“ oder ein „o“ in ihren Namen wie Monaka, Anko, Amanatoo oder Yookan. (123)

Die Analyse des affektiven Bereichs zielt darauf ab, die affektive Wirkung von Phonemen als ausschlaggebend für die Rezeption eines Artefakts in einer anderen Kultur darzustellen. Sinnkonstruktionen sind viel wichtiger als Artefakte selbst, was wiederum darauf hinweist, dass die Adaption eines fremden Artefakts auf vertraute Lautzeichen zurückzuführen ist, und dass es schließlich die Zeichen sind, die kulturelle Konventionen konstruieren, die wiederum von den jeweiligen Umkodierungen der Zeichen abhängig sind.

Semiotisch gesprochen untergräbt Tawada die *Autonomiethese*, der zufolge Grapheme (Buchstaben) noch keine Zeichen sind, da sie nichts bedeuten. Durch ihr literarisches Schaffen liefert sie eher Beispiele für die *heteronome* Auffassung der Schrift, da sie belegt, dass jedes einzelne Graphem das Zeichen eines Phonems ist. Indem das Graphem auf andere lautliche Elemente der Sprache verweist, übernimmt es die Funktion eines sekundären Zeichens und ist sprachliches Metazeichen (Nöth 2000: 361). In der Fiktion Tawadas ist es ein Meta-Metazeichen, von dem behauptet wird, dass es entschieden die Sinnkonstruktion mitbestimmt. Im Grunde genommen, bedient sich Tawada erneut Derridas *Spuren-Begriff*. Aufschlussreich ist dabei, dass sie im Essay *Sprachpolizei und Sprachpolyglotte*, in dem es wieder um das Spiel der Buchstaben geht, zum dem Schluss kommt, dass die Ich-Erzählerin von der Lust ergriffen ist, die Buchstaben durcheinanderzubringen, „um dem Spielplatz Wörterbuch seine poetische Ausstrahlung zurückzugeben“ (Tawada 2007: 37). Die praktizierte Polysemie gilt infolge dessen dem Spiel der Buchstaben, deswegen werden im Essay *Baumkuchen* keine Übersetzungen der Schriftzeichen vorgenommen, sondern es werden japanische Wörter gleich ins Alphabet transkribiert. Folglich erreicht ihr Schreiben die Qualität eines poetischen Wörterbuchs, was als Unikum die Qualität ihrer Schreibweise ausmacht und die kulturvermittelnde Funktion ihrer Schriften exemplifiziert, da es sich schließlich um ein poetisches deutsch-japanisches Wörterbuch handelt. Seine Inhalte sind jedoch nicht statisch, sondern müssen auf der Basis der Fiktion ständig hergestellt werden, da in einem Wörterbuch das eine Wort ständig auf das andere Verweist, was zu ständigen Sinnzuweisungen führt (Kimmerle 2000: 36)¹⁰.

Fazit: Tawadas Essays performieren einen dynamischen Kulturbegriff. Durch kulturelle Übersetzungen wird ein flexibler Umgang mit Differenzen postuliert, da diese je nach Situation

¹⁰ In diesem Sinn ist der Hinweis von Kimmerle in Bezug auf die Auffassung der Schrift als lesbare Spur zu verstehen, dass nämlich die Bedeutung der Spur bei Derrida darauf hinausläuft, dass sich Bedeutung ständig verändert und in stetigen Verweisungszusammenhängen erfasst werden muss.

kontextabhängig gesichtet werden. Im Grunde genommen liegt Tawadas Schriften folgendes semiotisches System zugrunde:

Primärkode → Interpretationen → sekundäres Bedeutungssystem →
Tawadische Poesie = Ästhetische Übersetzung der Schriftzeichen + kulturelle
Übersetzungen → kommunikative Funktion als Kulturvermittlung

Auf der Basis der Primärkodes ihrer deutschsprachigen Essays erfolgen Interpretationen auf metasprachlicher Ebene. Dieses sekundäre Bedeutungssystem drückt die Tawadische Poesie aus, die aus der ästhetischen Übersetzung der Schriftzeichen und überhaupt aus kulturellen Übersetzungen besteht. Die Funktion, die der Poesie Tawadas zugrunde liegt, ist im Grunde genommen eine kommunikative Funktion, da in Bezug auf deutschsprachige Leser Kulturvermittlung intendiert wird. Die Tatsache jedoch, dass sie ihr Schreiben als poetisches Wörterbuch strukturiert und kulturelle Übersetzungen sogar auf der Schriftebene versucht, zeugt zweifelsohne von einer regen Experimentierlust und der Originalität ihres Schreibens.

LE ROLE DES NORMES DANS LE CADRE D'UNE SEMIOTIQUE DE LA CULTURE

Anna Maria Lorusso
University of Bologna, Italy
(annamaria.lorusso@unibo.it)

Abstract

Je voudrais concentrer mon attention sur quelques points qui sont à mon avis cruciaux pour encadrer le travail de la sémiotique de la culture, en essayant de définir ce que lui est propre et qui fait la différence par rapport à d'autres approches (par exemple, la socio-sémiotique, une sémiotique tout simplement narrative, ou bien toutes les sémiotiques caractérisées par un champ-objet précis: la sémio de l'art, de la littérature, du cinéma etc...).

J'y tiens à préciser tout de suite la thèse centrale de ma brève contribution : à savoir, que la spécificité de la sémiotique de la culture doit se situer au niveau des normes: pas au niveau de la langue et pas au niveau des actes de parole, mais bien à celui des normes.

Je crois que trop souvent notre activité sémiotique a été une sémiotique de la langue ou bien une sémiotique de la parole (ou a eu tendance à se penser en tant que telle). On peut voir un intérêt pour la langue dans les travaux de Propp d'où Greimas a tiré son schéma narratif (universel!), dans le travail de Barthes sur la mode, dans les travaux linguistiques de Saussure ou d'Hjelmslev...

Pas moins nombreux les exemples de sémiotiques de la parole: toutes les analyses, souvent magnifiques, d'oeuvres d'art, d'oeuvres littéraires (*Deux amis* de Maupassant par Greimas, *Sylvie* de Gérard de Nerval par Eco), des films...

Un travail encore à faire, ou à développer, serait le questionnement du passage de l'un à l'autre niveau, c'est à dire le questionnement du passage des actes de parole aux systèmes de la langue.

Comment ça se passe? Quelles sont la relation, la direction et la dialectique entre parole et système?

Dans mon travail j'ai de plus en plus l'impression qu'un des points essentiels, pour la sémiotique de la culture, soit précisément ce passage, et que ce passage ne soit rien de plus que le procès de normalisation et de standardisation que le sens subit.

Il s'agit évidemment d'un passage qui a à voir avec de nombreux aspects cruciaux de la réflexion sémiotique:

- le rapport type/token (le problème étant de savoir comment on passe des token au type)
- le rapport processus / systèmes
- le rapport histoire / structure

Je pense à la sémiotique de la culture comme à une sémiotique des normes parce qu'elle trouve son plan de pertinentisation dans les modèles, les standards, les habitudes qui uniformisent les actes de parole et les rendent en quelque manière systématiques, cohérents, ordonnés, structurés. C'est à dire: elle concentre son attention sur les régularités qu'on peut retrouver parmi les milliers de tokens d'une communauté, ce qu'il y a de récurrent dans les procès d'un champ donné, ce qui modifie les structures d'une culture à travers l'histoire.

Je viens d'utiliser des mots différents – normes, modèles, standard, habitudes (d'après Peirce ou Bourdieu, je pourrais dire aussi habitus) – pour définir ce niveau intermédiaire entre langue et parole. Tous ces mots, bien que afférents à des théories et traditions différentes, se situent au même plan, un plan que Saussure n'a pas beaucoup questionné mais qui était déjà assez clair à Louis Hjelmslev, qui dans *Langue et parole* (Hjelmslev 1943b : 89) nous rappelle que l'objet de la sémiotique est le plan de l'exécution et que c'est à ce niveau qu'on peut repérer des normes:

La théorie de l'exécution [...] a pour objet ce que nous avons appelé jusqu'ici la norme, l'usage et l'acte. Norme, usage et acte sont d'autre part intimement liés ensemble et se ramènent naturellement à ne constituer qu'un seul objet véritable: l'usage par rapport auquel la norme est une abstraction et l'acte une concrétisation.

Et encore, dans :

La parole se définit comme l'ensemble des relations inter-stratiques effectivement exécutées.

L'usage, à son tour, est évidemment ce qu'il y a de stabilisé dans la parole.

[...] A la différence de l'usage, la norme doit être l'ensemble des relations inter-stratiques admises.

Le schéma sémiotique (et linguistique) par contre est en dehors de cet ordre d'idées. (Hjelmslev cit. : 76)

Les normes, donc, selon Hjelmslev, ne sont pas des règles abstraites, ne sont pas les éléments d'une grammaire, mais « l'ensemble des relations inter-stratiques admises » – ce qu'une culture inclut dans son espace comme légitime, ce qui – on pourrait dire avec Lotman – une culture « laisse passer ». Il s'agit de quelque chose qui va au-delà des actes de parole et qui est bien plus ample. Hjelmslev pose une différence importante entre les usages (ce qui est stabilisé) et les

normes (les relations admises). Les normes représentent l'espace du possible, du permis, du tolérable, tandis que les usages sont simplement ce qui se passe, dans ce champ du possible (du possible pour une culture donnée, pas pour les êtres humains en général).

Je crois que cette réflexion nous invite à revenir à certaines théories sémiotiques qui nous offrent des outils pour mieux problématiser la question des normes, et que donc je considère fondamentales pour une étude sémiotique de la culture : je pense notamment à la théorie de la culture de Lotman, à la théorie archéologique de Foucault et à la théorie de l'encyclopédie de Eco avec son héritage peircien. Par conséquent, je vais proposer un petit chemin sémiotique. Mon but est de reprendre quelques uns des piliers théoriques qui peuvent donner une base solide à une réflexion sémiotique sur les normes.

La théorie de Lotman a conçu la sémiosphère comme un grand mécanisme de structuration. Je cite de Lotman-Uspensky, *Sur le mécanisme sémiotique de la culture* : « Le travail fondamental de la culture est organiser structurellement le monde qui entoure l'homme. La culture est un générateur de structuralité ». En plus, la réflexion lotmanienne sur la traduction se présente en tant que réflexion sur le travail de inclusion et adéquation que la culture fait, c'est-à-dire sur le filtrage qu'elle opère pour établir ce qui peut être admis à l'intérieur de son espace. Pour ordonner structurellement l'information, la culture utilise des *dispositifs stéréotypant* qui permettent l'uniformisation et la comparabilité entre diverses formes et expressions hétérogènes de la culture. Parmi ces dispositifs il y a le langage, l'art, la littérature, le folklore, les religions etc., c'est-à-dire des domaines sémiotiques qui offrent aux sujets humains des *modèles*. Lotman parle de systèmes modélisant primaires (les langues naturelles et l'espace) et de systèmes modélisant secondaires (tous les autres domaines que j'ai mentionné).

Grâce à ces systèmes de modélisation, ce travail de structuration n'est pas un travail d'imposition abstraite mais bien un filtrage concret que la culture fait avec nous, au-delà de nous et à travers nous. On peut penser aux grands choix des institutions (la censure ou la « *damnatio memoriae* ») mais aussi aux pratiques quotidiennes et diffusées à travers lesquelles nous définissons par exemple les régimes de visibilité (le voile, l'ostension du visage et des autres parties du corps), les régimes de dicibilité (pensons à la question du « *politically correct* » : peut-on dire handicapé, nègre, etc.), les régimes de sensibilité (il est évident que chaque culture et chaque époque a des passions privilégiées et des passions marginalisées : aujourd'hui par exemple est privilégiée l'indignation et plus marginalisé la modestie, peut-être qu'aux États-Unis est plus valorisée que en Italie l'estime de soi etc.). Il y a des moments où le problème de l'admissibilité ou inadmissibilité devient dramatique : les homicides liés aux caricatures de Charlie Hebdo nous parlent de violence, mais nous parlent aussi du fait que (pour une certaine culture, qui est une partie de la culture islamique) certaines choses ne sont pas dicibles, ne sont pas admissibles, pour des communautés données.

Je crois que Lotman – avec sa réflexion sur les mécanismes de traduction en tant que dispositifs stéréotypant, avec la centralité qu'il donne à la catégorie de modèle, avec l'idée de structuration et pas de structure – peut nous aider de manière décisive dans le questionnement des procès de normalisation du sens. Structuration signifie organisation, et organisation implique le rejet de tout ce qui est insuffisant, inutile, exceptionnel, et implique donc un processus de normalisation.

Dans notre réflexion sur le rapport entre sémiotique de la culture et niveau des normes, une autre référence fondamentale est représentée par Michel Foucault et par sa théorie de l'archive et des formations discursives. Il s'agit d'une théorie précieuse parce qu'elle nous permet de nous concentrer sur la nature contraignante de la régularité et sur la taille super-individuelle des normes. La sémiotique, à mon sens, n'a pas pensé suffisamment son rapport avec la théorie de Foucault.

A mon avis le concept de « formation discursive » nous aide à passer d'une réflexion sur les textes singuliers (en tant que tels, actes de parole) à une réflexion, de toute façon textuelle, qui est transversale à plusieurs manifestations discursives, une réflexion qui porte sur les règles qui permettent aux textes de se produire et se donner. Il est beaucoup plus utile, par exemple, de la catégorie de praxis énonciative, que la sémiotique a proposé (cfr. Bertrand 2000) pour exprimer la stratification du sens.

Foucault écrit dans *L'archéologie du savoir* :

Dans le cas où, entre les objets, les types d'énonciation, les concepts, les choix thématiques, on pourrait définir une régularité (un ordre, des corrélations, des positions et des fonctionnements, des transformations) on dira, par convention, qu'on a affaire à une *formation discursive* [...] On appellera *règles de formation* les conditions auxquelles sont soumis les éléments de cette répartition (objets, modalité d'énonciation, concepts, choix thématiques). Les règles de formation sont donc des conditions d'existence (mais aussi de coexistence, de maintien, de modification et de disparition) dans une répartition discursive donnée. (Foucault 1969 : 53)

Ainsi, nous voyons que avec Foucault le champ d'attention de l'analyste se rétrécit: l'analyse se concentre sur les formes du discours dans la mesure où celles-ci expriment des règles qui finalement représentent leur condition de possibilité. Dans les discours on se focalise donc sur tout ce qui a une force de modélisation, ce qui détermine le champ du dicible et de l'exprimable.

Comme on le sait, l'ensemble de ces règles de formation est à la base du savoir archéologique. Quand Foucault parle d'étude archéologique, il n'entend pas une étude tout simplement diachronique, mais l'étude des archives des cultures, c'est à dire des *séries de règles* qui régularisent l'apparition des énoncés.

L'idée fondamentale est que les règles se stratifient au cours de longues périodes (pas forcément de manière continue; le plus souvent, en effet, avec des sauts) et qu'elles forment des palimpsestes qu'il s'agit de retracer.

Objectif de l'analyste doit être de mettre à jour l'ensemble des conditions – les règles – qui régissent, à un moment donné et dans une société donnée, l'émergence des actes de parole, leur conservation dans le temps, les liens qu'il y a entre eux. Dans la culture, à travers la multiplicité et la « dispersion » (pour emprunter un mot foucauldien) des actes de parole, on peut suivre les parcours qui structurent des règles, des parcours conditionneurs, qui vont générer des séries de phénomènes homogènes.

Je vais appeler archives non tous les textes qui ont été préservés par une civilisation ou l'ensemble des pistes qui serait sauvé par sa chute, mais le jeu des règles qui déterminent une culture dans l'apparition ou la disparition des énoncés, leur persistance et leur extinction, leur existence paradoxale en tant que événements et choses. (Foucault 1968 : 47)

L'archive pour Foucault n'est donc pas un dépôt, mais l'ensemble (jamais totalisable, jamais exhaustive et épuisable) des règles, c'est-à-dire des conditions qui rendent possible l'apparition de certaines formes de culture et qui, en même temps, rendent impossible l'apparition d'autres phénomènes. L'analyse archéologique doit analyser les formes de persistance, mais non la persis-

tance volontaire et consciente, plutôt ce qui est gardé de manière sovra-personnelle à travers les médias, les techniques matérielles, les institutions, les pratiques, les comportements quotidiens...

Umberto Eco a parlé à ce propos de « filtrage de l'encyclopédie », pour mettre en évidence la fonction fondamentale de « barrière » qui possède l'encyclopédie. Dans un contexte donné, il y a des éléments littéralement impensables, non à cause d'interdictions explicites, mais en raison de « cadres sociaux » qui ne permettent pas qu'on pense ou qu'on conceptualise certains énoncés. Par conséquent, ces énoncés tout simplement n'existent pas ; ils ne sont pas donnés, bien qu'ils ne soient pas interdits de manière explicite. La consonance avec Foucault est complète.

Les codes fondamentaux d'une culture – ceux qui régissent son langage, ses schémas perceptifs, ses échanges, ses techniques, ses valeurs, la hiérarchie de ses pratiques – fixent d'entrée de jeu pour chaque homme les ordres empiriques auxquels il aura affaire et dans lesquels il se retrouvera. (Foucault 1966 : 11)

Tout ça a évidemment beaucoup à voir avec les deux derniers auteurs que je voudrais mentionner : Umberto Eco et C.S. Peirce. Je les considère fondamentales pour définir le cadre théorique d'une sémiotique de la culture capable d'étudier les normes.

Pourquoi Eco ?

Eco, à partir de son *Trattato di semiotica generale* (Eco 1975), conçoit la sémiotique en tant que « logique de la culture ». Elle est donc un savoir qui vise à définir la *structuration* du sens, la manière dont la sémosis trouve une organisation en suivant des logiques et en exposant des régularités.

La logique qui est à la base de cette structuration - et donc de la sémiotique et de la culture - est une logique *encyclopédique*. L'encyclopédie est l'ensemble de toutes les interprétations enregistrées dans une culture ; en tant que telle, elle comprend les activités d'interprétation des individus et des collectivités et expose la connaissance moyenne d'un certain « état de culture », c'est-à-dire d'une culture donnée à un moment donné.

Eco propose donc une idée *encyclopédique* du sens. Il ne pense pas en termes de langue abstraite mais en termes d'un système de relations toujours en évolution, au fur et à mesure qu'on utilise les langages. Le lien entre encyclopédie et plan des actions ou actes de paroles est constitutif : l'encyclopédie se fait au cours des jours et des années et elle a toujours affaire à des *substances* sémiotiques (pas des formes). Elle est faite par des actes réalisés qui dans le temps trouvent une stratification, construisent des relations réciproques, sont répétés et de cette manière assument une régularité ou, au contraire, un caractère d'exceptionnalité. Ils font partie de l'encyclopédie : les significations qu'on donne aux mots, la façon dont nous interprétons les rites, les textes que dans une culture sont produits, les réactions habituelles à certains stimuli, les images qu'on laisse circuler, les symboles qui expriment certaines valeurs, etc.

Tout au long de cette production, grâce à la force de ses répétitions et de sa régularité, l'encyclopédie devient conditionnante ; les actes de parole en effet ne sont pas tout à fait libres : ils sont conditionnés par les parcours encyclopédiques précédents, et le conditionnement est de nature « statistique » (les parcours les plus fréquentes étant ceux qui conditionnent le plus les actions successives).

L'encyclopédie ouvre donc des possibilités mais rend minoritaires des parcours. Elle joue le rôle d'un réseau de possibilités et donc de conditions.

En vertu des toutes ces caractéristiques, je crois qu'elle soit une modélisation de ce que, au début, j'ai appelé le « plan des normes ». L'encyclopédie de Eco est l'ensemble des normes (ou des

relations admises, comme dit Hjelmslev) dans une culture. Elle est bien plus large de l'ensemble des actes de parole effectivement réalisés, mais elle n'a pas l'abstraction d'une langue et de sa grammaire : *elle est faite d'occurrences, de tokens* : ses nœuds sont les unités culturelles, à savoir des unités qui – pour Eco – sont réalisés, publiques et de nature communicative.

Cette théorie de Umberto Eco n'est pas sans rappeler la théorie de Peirce et sa catégorie de habitus.

Dans la perspective de Peirce, le sens – qui est toujours soumis à une chaîne interprétative – tend à se stabiliser en tant que « interprétant logique final ». Il y a donc des phases dans la sémiotisation qui, bien qu'elle ne soit jamais complète ou définitive, toutefois temporairement s'arrête. La chaîne des interprétations, toujours relancée par de nouveaux actes sémiotiques, pour quelques instants (pour quelques sujets, dans quelques phases historiques) s'arrête parce que la communauté reconnaît une « vérité », une forme de suffisance et justesse d'une interprétation donnée.

Ces stabilisations (les habitus) conditionnent les interprétations successives, ou, pour mieux dire, les actions successives : elles vont conditionner la manière d'agir et de réagir des sujets. Les habitus jouent donc un rôle de médiateurs entre le monde interne (mental et cognitif) et le monde externe (perceptif et pragmatique). Ils représentent des régularités qui deviennent des dispositions à agir d'une certaine manière. La force des habitus interprétatifs est en quelque manière pragmatique : elle ne reste pas dans l'abstraction des interprétations théoriques, mais conditionne concrètement le monde des actions.

l'identité d'un habitus dépend de la façon dont il peut nous conduire à agir, non seulement dans les circonstances où il est généralement donné, mais dans les circonstances où il pourrait potentiellement se donner, indépendamment de sa probabilité. Ce qui est un habitus dépend de quand et comment il nous pousse à l'action. [...] Il n'y a pas de distinction de sens plus subtile que celle qui consiste à une différence dans la pratique. (C.P. 5.400, notre traduction)

Cette théorie est liée à notre réflexion parce qu'elle nous conduit à réfléchir (d'un point de vue différent de celui de Lotman, par exemple) sur la dialectique de stabilisation et subversion, prévisibilité et changement qui traverse et caractérise toute la vie sémiotique. Il s'agit là d'un point central de la dynamique du sens ; c'est le point où théorie et pratique se rencontrent, où la sémiosis et l'action se croisent et le sens se fait *modèle d'action*, de prévisibilité, de partage, d'appartenance. Comme je l'ai dit, c'est la communauté qui définit les interprétants logiques finaux : il n'y a pas de normes, ni d'habitus abstraits et universaux, parce qu'ils dérivent toujours d'un partage et qu'ils sont toujours relatifs à un groupe donné qui les met en pratique.

Normes, habitus, parcours interprétatifs réguliers (à la Eco) sont donc au même temps :

- sociaux
- réguliers
- variables
- dépendent des exécutions discursives

Ils sont généraux, supra-individuels et pourtant historiques, en transformation continue. Ils définissent et réglementent les arènes discursives, et régissent la formation des énoncés indivi-

duels (pour revenir aux catégories foucauldienne).

Mon idée est que ce niveau des normes et des habitudes est le plus spécifique pour notre étude car c'est à ce niveau que certaines dimensions fondamentales de la culture se manifestent: la dimension *super-individuelle* (ce qui a une signification culturelle est ce qui représente une dimension partagée collectivement), la *dimension historique-évolutive* (usages et normes expriment la stratification interprétative et sémiotique, entre persistance, négociation et reformulation), la dimension *normalisante* (la culture, en dépit de son hétérogénéité interne, a une tendance intrinsèque à l'auto-organisation, à la régularité, à la création de zones d'homogénéité).

Cela ouvre un champ très riche pour la sémiotique de la culture. Le monde des normes, avec leurs interprétations locales, leurs exceptions, leur évolution, leur histoire, non seulement définit un niveau crucial de la culture qui est celui des systèmes qui définissent les politiques de la vérité et du pouvoir d'une certaine culture; mais implicitement ce niveau des normes exprime des formes spécifiques de valorisation et axsiologisation qui constituent les communautés. Partager des habitus signifie faire partie d'une même communauté, une communauté qui n'est ethnique, ni nationale, ni familiale, mais sémiotique, culturelle, archéologique (au sens foucauldienne) et que, en tant que telle, constitue l'objet d'étude propre à la sémiotique de la culture.

Abstract

Le but principal de notre étude c'est décrire le parcours de la figure de l'eau dans un film documentaire contemporain dans le cadre de notre réflexion sur la tradition orale péruvienne. Le film *Sigo siendo-Kachkaniraqmi* (Javier Corcuera, 2013) est une mosaïque de la diversité musicale et culturelle qui existe au Pérou actuel. Alors, on se pose des questions telles que, pour quoi cette récurrence de la figure de l'eau dans un film sur la musique populaire ? Comment est-ce qu'une forme discursive comme celle du documentaire audiovisuel fait place à la dimension mythique des chansons ancestrales ? Nous voudrions établir des rapports de la similitude et de la différence parmi les rites et les chants de deux cultures natives qui sont mis en évidence dans le film: la culture shipibo-conibo (de la région amazonienne) et la culture quechua (de la région andine). L'eau se présente dans les rituels très différents comme le baptême d'une danseuse traditionnelle au pied d'une cascade, aussi bien que le nettoyage collectif d'un canal d'irrigation et encore, le voyage solitaire et mythique de la femme-Anaconda dans une pirogue sur un immense fleuve amazonien.

* Una versión previa de este estudio ha sido publicada en la página del XII Congreso Latinoamericano de Investigadores de la Comunicación ALAIC 2014, bajo el título: "El motivo del "agua" en dos cantos tradicionales de dos lenguas ancestrales peruanas, el shipibo-conibo y el quechua. Análisis semiótico de la dimensión mítica en el documental *Sigo siendo (Kachkaniraqmi)* de Javier Corcuera", el día 7 de agosto del 2014, en la Pontificia Universidad Católica del Perú. <http://congreso.pucp.edu.pe/alaic2014/wp-content/uploads/2013/09/vGT14-CELIA-RUBINA-VARGAS.pdf>

L'étude des mythes et récits populaires péruviens est depuis un certain temps au centre de notre intérêt (Rubina, 1999, 2008, 2012). Notre point de vue est celui de la sémiotique discursive, et plus particulièrement nous sommes intéressés dans la problématique des motifs ethno littéraires, c'est-à-dire, des micro-récits récurrents qui peuvent migrer d'un récit mythique vers un autre, d'un univers culturel vers un autre univers culturel, mais aussi entre les objets de nature très différente (Greimas 1985, Courtés 1986, 1995). Pour aborder l'étude de la tradition orale andine et la tradition orale amazonienne, notre référence la plus directe se trouve dans les travaux de Ballón-Aguirre (2006). Pour l'étude des motifs en ethno littérature on fait la distinction parmi le motif narratif et le motif sémantique. Dans cet essai nous allons travailler davantage sur le motif sémantique étant donné que la figure de l'eau n'est pas rattachée d'une façon permanente à une seule structure narrative mais elle peut accomplir divers rôles. Une analyse sémio-linguistique est privilégiée pour établir le rapport entre les récits mythiques et les chants ancestraux.

Desde la perspectiva de la semiótica discursiva y del estudio de los motivos (Greimas 1985, Courtés 1986, 1995, Ballón Aguirre 2006), el objetivo de este estudio es determinar la organización semántica del motivo del "agua" en relación a la cultura shipibo-conibo y la cultura quechua sureña que aparecen en el film peruano *Sigo siendo Kachkaniraqmi* (Javier Corcuera, 2013). Es notable que en un documental sobre la diversidad de la música popular peruana, la figura del agua aparezca con tanta recurrencia, como un hilo conductor tanto verbal como visual. De las variadas manifestaciones del agua en el filme, nos limitamos al estudio de tres secuencias que ponen de relieve la dimensión mítica del agua a través de prácticas sociales tradicionales como son el canto ritual shipibo, el bautizo de una danzante de tijeras y la limpieza de un canal. El estudio semántico busca mostrar los aspectos coincidentes de dos culturas ancestrales peruanas: la cultura quechua de la región andina y la cultura shipibo-conibo de la región amazónica.

1. El documental musical: un recorrido geográfico y humano

El destacado cineasta peruano Javier Corcuera realiza en *Sigo siendo Kachkaniraqmi* (2013) un proyecto filmico que plantea un recorrido por lugares y gentes del Perú a través de la música. Ésta se expresa básicamente en las canciones populares y por lo tanto, las voces de los intérpretes nos conducen a lo largo del film. A nivel musical, la interpretación de instrumentos cobra una especial importancia, en particular los instrumentos de cuerda como el violín, el arpa, la guitarra y el charango para el caso andino. De modo deliberado, el filme se aleja de los lugares comunes por ello no se muestran las consabidas queñas, ni zamponas¹; en cambio sí, otros instrumentos de viento como el wakrapuku (trompeta andina hecha con cuernos de toro).

El documental como el *road-movie* hace un recorrido geográfico por distintas regiones del Perú. Se inicia en el corazón de la amazonía peruana, en la región de Pucallpa cerca de Yarinacocha, con el testimonio de Amelia Panduro, heredera del saber de los chamanes de la cultura shipibo-conibo. Con ella recorreremos una parte del bosque amazónico, surcamos el río Ucayali que aparece ante nuestros ojos como una extensión acuática inconmensurable. Pero hay un viaje que se presenta de modo más explícito y que consolida una narrativa específica, es el viaje del violinista Máximo Damián que parte desde Lima, su lugar de residencia, hacia Ishua su pueblo natal en Ayacucho, en el sur andino peruano. Es un viaje de retorno a los orígenes de la música, a los lugares donde escuchó y aprendió a tocar violín, es como un rito anual regresar a su pueblo por la celebración de la Fiesta del Agua.

De regreso sobre la costa y de la mano de otros músicos, recorreremos diferentes espacios de la ciudad de Lima. De los muelles, la orilla del mar, calles concurridas, el tráfico de las avenidas, llegamos a los lugares donde se hace música: bares, peñas y quintas o callejones, las modestas ca-

¹ Tampoco está presente el más famoso cliché de la peruanidad musical: El cóndor pasa de D. A. Robles.

sas de los maestros de la música. Nuevos instrumentos de cuerda y de percusión hacen vibrar la variada música criolla: el contrabajo, la guitarra, el bongó, el cajón, la cajita, la quijada de burro. Lima aparece justificadamente como el punto de encuentro de la migración interna en el Perú. Por eso este documental es también un recorrido humano por los esfuerzos de los músicos en seguir haciendo música aún lejos de sus lugares de origen.

1.1. La diversidad musical como una la imagen de la peruanidad

En el film, la identidad nacional no busca definirse ni por un género musical ni por un tema en particular, no se postula una canción como un himno o como un ícono nacional². En cambio, sí se subraya la pluralidad de las expresiones musicales peruanas, la diversidad de ritmos, melodías, lenguas en las que se canta y se baila.

Recordemos que el documental por oposición a la ficción es un género fílmico que está ligado a la realidad, pero no tanto porque presente directamente realidades y vivencias de una determinada comunidad, sino porque crea ese efecto de sentido. En *Sigo siendo Kachkaniraqmi* la impresión de realidad comienza por el hecho de que los personajes hablan en su lengua materna. En un país como el Perú donde, a pesar de su multiculturalidad y plurilingüismo, las lenguas ancestrales viven una situación de discriminación frente a la hegemonía absoluta del castellano, es notable que en buena parte de este filme se escuche hablar en shipibo-conibo y en quechua.

La idea de peruanidad que postula el film se refleja en el título *Sigo siendo Kachkaniraqmi*. Precisemos el significado de esta expresión quechua de la que habló José María Arguedas (Pini-lla 2004, 7). A la raíz verbal ka- (verbo ser) le siguen los siguientes sufijos: -chka (sufijo durativo que indica un proceso que se prolonga en el tiempo), -ni (sufijo de primera persona singular), -raq (sufijo continuativo que expresa la continuidad de un estado pero también un contraste) y -mi (sufijo reportativo de primera mano por el cual el hablante confirma que tiene conocimiento directo de aquello que enuncia)³. Por lo tanto, la enérgica expresión de vitalidad y persistencia “*Kachkaniraqmi*” podría entenderse como la afirmación de que a pesar de todo “sigo siendo” o “sigo existiendo” (con mi música, en mi lengua).

1.2. Dimensión mítica y prácticas rituales

Cuando hablamos de lo mítico pensamos por lo general en un relato tradicional en un “mito”, particularmente, en aquellos relatos cuyos protagonistas son los seres sagrados propios de una comunidad y la realización de hechos portentosos. La semiótica discursiva ha comprendido que lo mítico trasciende el relato etnoliterario y tomando como base los estudios de Lévi-Strauss opone lo pragmático de una lectura horizontal a lo mítico de una lectura vertical, paradigmática que “permite reconocer por su recurrencia en el texto de superficie, una organización de contenidos que puede formularse como la correlación de dos categorías binarias de semas contradictorios o contrarios” (Greimas & Courtés 1982:261). Bajo esta perspectiva, lo mítico encuentra en las estructuras sintácticas y semánticas profundas su carácter esencial y al mismo tiempo, deja de ser específico pues ya no se restringe a un solo tipo de discurso.

Las culturas ancestrales peruanas como la quechua y la shipibo-conibo mantienen vigentes sus tradiciones orales, tanto a nivel de relatos míticos como de cuentos populares. Ni mitos, ni cuentos, ni leyendas han sido objeto de la filmación en la película *Sigo siendo Kachkaniraqmi*. Sin embargo, no podemos decir que la tradición oral no esté presente en la película. Por una parte, la tradición etnoliteraria ancestral se manifiesta también a través de los cantos en lengua

² Aunque nos parece muy sugerente la propuesta de Andacht (2012) para las canciones uruguayas del documental analizado en su estudio, no hemos encontrado algo similar para el caso peruano en nuestro documental.

³ Sobre los sufijos y la morfología quechua ver Cerrón-Palomino (1987, 132-151; 1994, 85-142).

nativa, más aún cuando estos están ligados a una práctica ritual que se relaciona con una visión trascendental del universo. Esto lo explicitaremos con el análisis de las tres secuencias elegidas: el canto shipibo no se puede entender fuera de la concepción de las fuerzas que habitan los ríos de la selva; el bautizo de la danzante de tijeras exige el concurso de los Apus o divinidades de la montaña; la limpieza del canal hace que el agua sea considerada no solo como un recurso necesario para la agricultura, sino que el agua es tratada como una persona.

En relación a las prácticas rituales recordemos que al igual que las rutinas “encarnan una idea de significado basado en la repetición, en la imposibilidad de cambio o de elección, y en la naturalidad de las acciones” (Leone 2012:72). En efecto, los oficiantes del bautizo de la mujer danzante de tijeras repiten los gestos que muchos otros hicieron antes que ellos sin cuestionarlos: beben un trago, sumergen las tijeras en el agua, se arrodillan. Sin embargo, en el filme se evidencia que todos ellos tienen plena conciencia del por qué hacen una peregrinación dificultosa hasta el pie de la montaña donde cae una cascada, no podrían hacerlo en otro lugar pues es allí donde evocan a sus ancestros y a los dioses de las montañas.

2. El “agua” como un motivo semántico

En este documental sobre la música peruana aparece de manera reiterada la figura del “agua” a través de diversas figuras del universo acuático. Recordemos que el estudio de los motivos tiene una larga tradición en las artes plásticas y las tradiciones orales, por ello desde el punto de vista semiótico, Courtés (1995) ha subrayado la naturaleza semántica y el carácter migratorio del motivo:

En todos los casos se trata de una determinada forma semántico-sintáctica, identificable así en campos variables. Cualquiera que sea su soporte de base (lingüístico, auditivo, visual, gestual, espacial, etcétera), a primera vista se caracteriza por la reiteración, la reanudación (en forma ora idéntica ora, dado el caso, comparable con ligeras variaciones por lo menos aproximadas) tanto en el interior de un mismo objeto (por ejemplo, el motivo de un friso o el de un paso de danza) como en objetos de naturaleza análoga (los capiteles de un antiguo claustro) e incluso totalmente diferentes (entre otros casos, en arquitectura urbana). (38)

Los motivos en etnoliteratura pueden estudiarse a partir de dos formas recurrentes. Por una parte, con el “motivo narrativo” podemos identificar un núcleo narrativo estable susceptible de aparecer como un micro-relato al interior de diferentes relatos. Esta es la línea que ha privilegiado E. Ballón-Aguirre (2006, vol.1, 279–413, vol. 2). Por otra parte, el “motivo semántico” se caracteriza por un conjunto de figuras que aparecen reiteradamente en los relatos pero de una manera más libre, es decir, el elemento figurativo recurrente no se encuentra necesariamente ligado a una estructura narrativa única (Courtés, 1995, 49–53).

Según las distinciones expuestas, consideramos la figura del “agua” en la película *Sigo siendo*, como un motivo semántico aunque no siempre cumple una misma función. En algunos casos, el “agua” está asociada a la espacialidad, es el lugar donde se desarrollan las acciones (la “catarata” de Andamarca es el lugar donde se bautiza a la danzante de tijeras Palomita), en otros casos, el “agua” cumple una función actancial, puede ser Sujeto de estado (el violinista Andrés “Chimango” Lares dedica sus temas musicales a las “olas del mar”). Asimismo, el “agua” puede cumplir un rol protagónico, en tanto Sujeto humanizado u Objeto valorizado como lo precisaremos en el análisis de los cantos shipibo y quechua.

Cabe señalar que la denominación léxica del motivo a partir del lexema “agua” cumple una función genérica que incluye denominaciones específicas tales como: “lluvia”, “río”, “laguna”, “cocha”, “cataratas”, “acequia”, “olas”, “mar” entre otras que se enuncian en la película de manera visual y/o verbal.

2.1. El “agua” en el canto shipibo

La intervención de Amelia Panduro, mujer de la comunidad shipibo-conibo⁴ es doble tanto a nivel testimonial como a través de su canto. El filme se abre y se cierra con sus palabras, su voz y su imagen. La palabra hablada y la palabra cantada están íntimamente ligadas, se complementan y establecen una correspondencia que permite su mutua inteligibilidad.

El canto de Amelia es un ícaro o canto ritual shipibo que se inicia con las siguientes palabras: “Viajando, voy viajando/conectando con el agua/conectando, conectando” (1–3)⁵. Mientras escuchamos su canto, vemos a la mujer shipiba subir a su canoa, avanzar remando hasta desembocar en el gran río Ucayali que tiene la apariencia de una amplia laguna. Las primeras líneas del canto muestran la relación del “yo” del enunciado con la figura del “agua” que nos hacen pensar en una correspondencia entre la figuras visuales y las figuras léxicas, la mujer entra en conjunción con el “agua” a través de la navegación. Sin embargo en los versos siguientes la correspondencia visual-verbal se sostiene solo en parte: “Así, así, así, voy andando/ En mi barco, en este barco/ Mi barco de piedra” (4–6). La acción de la mujer remando está subrayada por las formas verbales durativas (“viajando”, “conectando”, “andando”) pero la “canoa” que vemos en el film es evidentemente de madera y no de “piedra”. El viaje emprendido no es un viaje cotidiano: “Retorno... yo, la mujer/ Viajando por la profundidad del agua/ En la anaconda/ Desde dentro del río” (10–13). La “canoa” del film se desliza sobre la /superficie/ de las aguas mientras que el “barco” del canto se adentra en las /profundidades/ del río. De esta manera se marca la espacialidad, el viaje es “desde dentro del río” (13), “por el fondo del agua” (17). Se trata entonces de un viaje mítico y la mención a la “anaconda” nos confirma la dimensión mítica del canto.

Recordemos la importancia de la anaconda en la tradición oral shipibo-conibo. En el mito de creación del universo el Padre Sol delega el cuidado de su creación a cuatro divinidades principales:

Kaná (Rayo), **Ino** (Jaguar), **Ronin** (Anaconda), **Xono** (Lupuna) son los guardianes del universo. Rayo es el dueño del cielo, Jaguar ejerce su dominio sobre los animales salvajes en las profundidades de la selva, **Ronin**, el gran anaconda, es el guardián de las aguas. Él es quien ha dibujado sobre la tierra el curso de nuestros ríos. Deslizándose por el suelo ha formado sus cauces. El vela por los lagos y los ríos. **Xono** es el Gran Dueño de la lluvia y de los árboles. Es también un poderoso brujo. **Varokan**, el volcán, controla el espacio subterráneo. Y también hay una multitud de espíritus, los **yoshin**, que vigilan el mundo. Todo aquello ha sido ordenado por Sol. (Bertrand-Ricoveri, 2010:46)

Queda claro que la Anaconda (“Ronin” en lengua shipiba) es la divinidad tutelar de las aguas. El nombre shipibo de Amelia Panduro es Ronin Wano Ainbo⁶, su relación de identidad con la

⁴ La lengua shipibo-conibo forma parte de la familia etno-lingüística Pano. La ubicación geográfica actual de los shipibos se despliega a lo largo de las márgenes del río Ucayali, en la zona centro-oriental de la Amazonía peruana.

⁵ Por razones de espacio no presentamos la transcripción integral de los cantos estudiados. Nos limitamos a poner la enumeración -entre paréntesis- de los versos de cada canto en nuestras citas.

⁶ El nombre shipibo-conibo de la cantante amazónica aparece en los créditos del film. También en la página oficial de la

Anaconda está marcada desde su nombre. En el canto, esta relación de identidad se encuentra desplazada: “Yo, la mujer/ La mujer encantada de la anaconda/ Y así les canto yo/ Yo la que viaja por el fondo del agua” (14-17). La “mujer” del canto viaja a las profundidades de las aguas del “río”, este “yo” femenino comparte en tanto “mujer encantada”, el carácter sagrado de la anaconda y su desplazamiento por las profundidades del “río” tiene un propósito: “Estuve con los guardianes del agua/ Con los guardianes llegando a acuerdos/ Llegando a acuerdos/ Así, abrazando acuerdos/ Estuve en el corazón/ En el corazón de la anaconda estuve” (19-24). Entonces aunque la identidad de la mujer del canto se aproxime a la de la Anaconda, no se trata de una fusión de identidades. Es necesario que el “yo” de la “mujer encantada” mantenga su independencia para erigirse en un sujeto capaz de llegar a establecer un acuerdo con la divinidad⁷.

El canto no explícita el carácter de esos acuerdos, pero la propuesta filmica asocia el canto y el testimonio de Amelia que lo precede: “Yo tengo un diálogo con el agua para que ella me dé su fuerza./ Ella nos da la fuerza de su profundidad para tener la energía de su cuerpo” (1-2). Aquí también se establece una relación de conjunción entre el “yo” y el “agua” a través de la figura del diálogo y del don: el agua otorga el /poder-hacer/ a la mujer dándole “fuerza” y “energía”.

Durante esta parte del testimonio, las imágenes que vemos no son todavía las del “río” sino las de un “árbol” gigantesco, la lupuna (*ceiba pentadra bombácea*) del que dice: “El río tenía inmensos árboles. A las orillas se veía árboles grandes como éste,/ como la Lupuna. Antes de ir a otro lugar, las ancianas le pedían permiso a la Lupuna./ Y la Xoná vive a orillas del río (...)” (3-5). La mención a esta otra divinidad tutelar, Xoná, el dios de la lluvia y de los árboles, permite ver la asociación entre la figuras del agua como “río”, “laguna” y “lluvia” con las figuras del mundo vegetal, como la “lupuna”. El universo acuático está entonces doblemente relacionado con el universo vegetal: en el plano pragmático de la naturaleza representada visualmente en el filme y en el plano mítico presentado en el canto.

El carácter ecológico de los acuerdos entre la naturaleza y los hombres se explicita cuando Amelia refiriéndose a los árboles dice: “Nuestros antiguos los respetaban “El agua se va a secar. ¿Cómo vamos a detenerlo?” decían los abuelos” (6). Esta preocupación por el agua está claramente expresada en su testimonio y en el canto, una conciencia ecológica que proviene de la relación de la cultura shipibo-conibo con la naturaleza por ello forma parte del saber de los ancestros. La amenaza con respecto al agua, es el riesgo de sufrir escasez o contaminación que afectaría profundamente la vida de comunidades cuya subsistencia depende de la pesca, la agricultura y la comunicación fluvial.

2.2. Canto shipibo-conibo para las imágenes del ritual quechua

La última estrofa del canto shipibo-conibo se escucha en la cuarta escena del film: la voz de Amelia Panduro cantando se escucha en off, ya no está asociada al paisaje selvático sino a las alturas serranas. Las imágenes corresponden al peregrinaje de la comitiva que se alista a cumplir un acto ritual –la bendición y el bautizo de una mujer danzante de tijeras, Palomita- al pie de las “cataratas” de Andamarca. Al plano general de un camino serpenteante entre montañas, le sigue un contrapicado que nos muestra el curso sinuoso de un río andino, finaliza con una sucesión de planos de detalle que muestran las patas de la recua y los pies de los músicos, por el camino empedrado del río. Este acoplamiento sonoro y visual entre dos culturas tan distintas como la shipibo conibo y la quechua podría pasar desapercibido para quien no maneja ninguna de las

película, varias consultas entre marzo y octubre del 2014; <http://sigosiendo.pe/>

⁷ En relación a la “mujer encantada” Danny Chávez nos señala que es necesario entender que la mujer “encantada” es una mujer protegida por la anaconda. Moviéndose en el espacio acuático, la mujer necesita la protección de los espíritus del agua. Agradecemos a Danny Chávez -heredera de la cultura shipibo-conibo- por compartir sus conocimientos. Comunicación personal, entre julio y septiembre del 2014.

dos lenguas ancestrales.

Los últimos versos del canto shipibo-conibo dicen: “Voy viajando, voy viajando, voy viajando/ Al último rincón del río/ Si a ese lugar voy/ Al corazón, adentro del agua./ Naciendo, naciendo” (25–29). Estos versos adquieren una doble significación. Por una parte se refieren a la travesía de la “mujer encantada de la Anaconda” que está llegando a su destino para lograr un acuerdo con los guardianes del “agua”. Se mantiene la isotopía de lo acuático (“río”, “laguna”) frente a la inminencia del nuevo pacto entre el hombre y la naturaleza. Por otra parte, las palabras del canto shipibo se ajustan bien al ritual andino del bautizo de Palomita: el camino del “río” los lleva “viajando”, “viajando” al “corazón” de la caída de “agua” donde se oficiará la ceremonia de bendición de las tijeras gracias a la cual asistimos al “nacimiento” de Palomita como danzante de tijeras. La dimensión mítica del ritual que sigue a continuación se reconoce en los gestos: Palomita de rodillas sumerge las tijeras en el agua, todos beben un trago; y también en las invocaciones a la divinidad de la montaña, al “Huamani”, del oficiante maestro danzante de tijeras, Florián Cesáreo Ramos, y la evocación a los ancestros, prestigiosos danzantes de tijeras. La asociación de las dos narrativas a través de la música de la una y la imagen de la otra genera un nuevo sentido y logra un abrazo entre las dos culturas ancestrales, entre lo amazónico y lo andino.

2.3. El “agua” en el canto quechua

El harawi o canto tradicional quechua interpretado por Cristina Pusac, anciana mujer del pueblo de Cabana tiene lugar en la sexta escena del filme. En el marco de la Fiesta del Agua, la faena comunal de la limpieza de la acequia ocupa un lugar preponderante. Aunque *Sigo siendo* no es un documental etnográfico, muestra la secuencia de los gestos de la limpieza del canal: mujeres con flores de retama a sus espaldas, la autoridad comunal llamando a todos a participar, hombres armados de picos y palas retirando el barro y las piedras del lecho de la acequia, mujeres de polleras bordadas recogen las piedras pequeñas. En un recodo del paso de la acequia, Cristina Pusac rodeada de sus comadres inicia su canto: un harawi del “agua”. Cada tres o cuatro versos, las mujeres hacen el coro con una enérgica exclamación de alegría, característica en los cantos serranos.

El motivo del “agua” está claramente marcado desde el inicio del canto quechua: “Mi árbol sagrado, durazno mío,/ Para qué estás parado al borde de la acequia/ Qué estás creciendo al borde de la acequia/ Mi árbol sagrado, manzano mío,/ Anda llamando a tu agua/ Para que tomes el agüita” (1–6). Las figuras más importantes del universo acuático son aquí la “acequia” (“yarqha”) y el “agua” (“yaku”) que ésta contiene. El motivo del “agua” también está ligado al universo vegetal. La contigüidad de los árboles de “durazno” y del “manzano” con respecto a la “acequia” está fundamentada sobre la función que el “agua” cumple para ellos: necesitan el agua para “beber” y “crecer”. El “yo” del enunciado establece una relación de posesión con los “árboles” (reiteración del sufijo posesivo quechua -y). El árbol (“mallqui”) juega una doble dimensión de /sacralidad/ (es “sagrado”) y de /humanidad/ (“bebe el agua”, “llama al agua”). El universo animal está también presente en la figura del “picaflor” (“qinti”): “El picaflor que mandé/ De huerta en huerta está buscando flores/ Mandé al picaflor/ Voy a beber con mi compadre” le he dicho” (7–10). El “picaflor” indica la isotopía de la bebida tanto del pájaro que bebe de las “flores” como de la bebida celebratoria entre “compadres”.

El abastecimiento del “agua de riego” a través de las “acequias” no está de por sí asegurado para la comunidad. La cuarta estrofa del canto dice: “¿Qué dirá ahora tu corazón/ En el cerro de mi Cabana?/ Acaso agua ya está llegando?” (11–13). La renovación del “agua” depende de la faena del trabajo comunal y de una fiesta religiosa, la /sacralidad/ del rito está marcada en el canto.

Para esclarecer los sentidos que señalamos, recurrimos a otra fuente de tradición oral. En el

capítulo 7 del *Manuscrito de Huarochiri*⁸ – texto fundacional de la mítica andina – se describe los rituales en honor a Chuquisuso, deidad femenina que custodia el canal de Coccochalla. Como parte del ritual de la limpieza del canal se narra que una mujer haciendo las veces de Chuquisuso traía chicha en un gran recipiente y lo distribuía entre los presentes diciendo “He aquí la chicha de nuestra madre” (Taylor, 7:11). Es claro que quien provee el “agua” es la divinidad femenina, Chuquisuso.

La limpieza de la acequia forma parte de la Fiesta del agua donde todo el pueblo participa saliendo a las calles para reventar petardos, beber, bailar en grupo, cantar. El abastecimiento del agua se asegura no solo con el trabajo de limpieza de la “acequia” sino también con el cuidado del “agua”. En el canto quechua aparece claramente una conciencia ecológica con respecto al agua: “Esta agua hay que cuidarla bonito/ Hay que acariciarla bonito” (14–15). Hay una /humanización/ del “agua” que debe ser tratada como una persona a la que hay que “darle cariño”, o como decimos en el castellano andino, “cariñarla”.

La llegada del agua es el momento de mayor exaltación en esta secuencia de la película. A los gritos de “¡Yaku! ¡Yaku!” les sigue la estrofa que rinde homenaje a los ancestros en la figura de los padres: “Aquí está papá/ Aquí está mamá/ Has conseguido que nos alegremos” (23–25). Lo más resaltante en el plano visual es el predominio del ángulo de toma contrapicado para resaltar la expectativa de los campesinos frente a la llegada del “agua”. Vemos el lecho seco de la “acequia” ir llenándose de “agua” a medida que ésta cae. Enunciativamente la dirección de /arriba/ hacia /abajo/ crea la ilusión del “agua” que llega hasta nosotros, los espectadores.

Presentamos a continuación presentamos el cuadro que resume la organización semántica del motivo del “agua” en las tres secuencias del corpus según los distintos niveles de análisis estudiados.

Cuadro 1: Organización semántica del motivo del agua.

ASPECTOS SINTÁCTICO- SEMÁNTICOS	CULTURAS ANCESTRALES		
	SHIPIBO-CONIBO	QUECHUA SUREÑA	
FIGURAS DEL UNIVERSO ACUÁTICO	"cocha", "río", "laguna" Ucayali	"río", "catarata" Andamarca	"acequia" Cabana

⁸ Documento excepcional de inicios del siglo XVII, fue escrito íntegramente en quechua. Seguimos el trabajo filológico de su más importante estudioso y traductor, G. Taylor (1999).

3. No cantamos por cantar

Los cantos ancestrales de ambas culturas estudiadas, la shipibo-conibo y la quechua sureña, ayudan a preservar la dimensión mítica de la figura del “agua”. El motivo del “agua” no solo es importante por su presencia reiterada sino por lo que significa para los habitantes de las comunidades a los que provee de fuerza, vida y energía. Pero su modo de hacerlo es siempre contractual, requiere de un “diálogo” entre los pobladores y las fuentes de agua, busca llegar a “acuerdos”. De una manera humanizada, al “agua” hay que tratarla “bonito”, con “cariño”.

Con su testimonio, Amelia Panduro hace explícitas las razones por las que canta. Ella responde cabalmente la pregunta implícita en el film ¿Por qué cantas?: “Con la fuerza de mi inspiración, canto para el agua y para la tierra, para la naturaleza que da fuerza a este mundo. Cuando me inspiro, canto” (7-8). En estas palabras expresa tanto el /poder-cantar/ como el /querer-cantar/. El canto se ofrece a los bienes de la naturaleza. Es la existencia de la colectividad la que está en juego. La modalidad del /saber-cantar/es fundamental: “Desde muy niña aprendí a cantar y ahora que soy anciana tengo más conocimiento y me nace, por eso canto” (12). El saber adquirido en la infancia se acrecienta con los años pero es necesario que no quede en uno mismo y es por eso que el /saber-cantar/ está asociado al /deber-cantar/: “Y debo compartirlo con todos, compartirlo para que los jóvenes me escuchen” (8). Entonces el canto es un objeto de saber que debe transmitirse, la modalidad modalizada se presenta como un /deber-hacer-saber-cantar/ a los más jóvenes, en caso contrario, corre el riesgo de perderse irremediamente con el fin de la existencia individual: “Si mis nietos aprendieron, mi canto se quedará en esta vida. Si nadie aprendió, cuando descansa será como llevar mis cosas amontonadas” (13-14).

Las palabras de Amelia Panduro cierran el filme: “Los pájaros hablan diferentes idiomas, cuando cantan unos son melancólicos, otros son alegres. Si ustedes no entienden, si no comprenden, piensan que cantan por cantar” (15). El mundo sonoro de las aves es equiparado al mundo sonoro de los humanos, la diversidad de los unos y los otros es perfectamente comprendida en la gran sabiduría de la mujer shipiba. A nivel enunciativo ese “nosotros” de la comunidad shipibo-conibo que conoce la naturaleza, la escucha y aprende de ella, termina cuestionando a ese “ustedes” interlocutor-espectador en su capacidad de apreciar las correspondencias entre la naturaleza y el hombre, y comprender las razones de su canto.

ABDUCTION AS THE MISSING LINK BETWEEN AESTHETICS AND BIOLOGY

Drude von der Fehr
University of Oslo, Norway
d.v.d.fehr@ilos.uio.no

Abstract

In the forthcoming book *The Live Body*, which I am currently editing, I present the cooperation between different aesthetic fields (literature, music, theatre) and biology as a field of possibility. The cooperation makes ab–duction happen as an event forming the meaning of the book. According to Gilles Deleuze and Fèlix Guattari in *Qu'est-ce que la philosophie?* A concept cannot be understood unless the problem is solved. This means that concepts gain meaning in retrospect and so does the book. Only by being used and rethought in different practical and theoretical contexts the book gains a definite meaning. The field of possibility works as a creative hypothesis. The hypothesis is that the body knows. But what does it know, and how do we know that it knows? We seem to think in this book, that what the body knows is in line with the hypothetical and uncertain quality of the abductive inference. The Norwegian literature researcher Elisabeth Løvlie, in her chapter “I know something that I do not know” (“Jeg vet noe jeg ikke vet”), draws in the newborn infant’s so-called amodal perception, a form of knowledge that is immediate and incomprehensible. According to her, new experimental science makes it clear that the body possesses this special kind of knowledge which does not rely on reflection. An infant has an immediate experiential and developmental relationship to its environment. This type of knowledge has long been a prerequisite for aesthetic and literary thinking and has been

something which attempts have been made to attain, among others by emphasizing the aesthetic experience. The Danish biosemiotician Jesper Hoffmeyer's claim, namely that we have a biological, physical cognitive ability to anticipate the consequences of choices, and that even the simplest of organisms has it, is most important in understanding what the body knows – Charles Peirce's understanding of realism is important in this connection, because a semiotically realistic perception of man and of the universe relies on something that is hypothetical, potential and possible (or more likely abductive) rather than actual.

That which I aim to expound in this book, is a creative and strategic space which includes sufficient knowledge to make it possible to jump ahead and give the initial hypothesis – namely that the body knows – credibility and the possibility to exist in this world. As biological organism we have a “knowledge” which art struggles to express aesthetically and performatively. And this “knowledge” is real, semiotically speaking. What I want to argue for in this paper is that abduction is a starting point for expanding a hypothesis into a space for thought that has its basis in strategic principles. By virtue of having determination, the field of possibility is guided by a final causality, or in other words, a pragmatic meaning.

This paper is based on my introductory chapter in a book that I have initiated and edited, and which is now under publication. The book *Den levende kroppen. Mot en ny forståelse av menneske og natur. [The Live Body. Towards a New Understanding of Man and Nature]*¹ is an interdisciplinary cooperation between different aesthetic disciplines; literary, theater and musical studies; biosemiotics, epigenetics; philosophy; and theology. In the book I focus on the possibility of a creative meeting between aesthetics and biology. In order to do so, I argue for the establishment of a *field of possibility*, that is to say a place where disciplinary diversity can express itself.² What makes this possible is a focus on a specific concept. For the idea that a concept can form the basis for a creative field, evidence can be found in Gilles Deleuze's theory that concepts are aspects of reality. Concepts are living and creative and bring something new into the world. *Abduction* is such a concept. It is both a concept *regarding* creative thinking, and *in itself* creative. In their description of what a concept is, Deleuze and Guattari argue in *Hvad er filosofi? [Qu'est-ce que la philosophie? 1991]*, that a concept refers back to a problem, to problems without which it would have no meaning, and which can even be isolated and understood as their solution reveals itself (1996: 36). We hear the similarity here between the thinking of Deleuze and Guattari and Peirce's maxime of pragmatism.³

So what is abduction? It is a form of inference that forms part of Charles Peirce's logic. Abductive inference is in the following form:

The surprising fact, C, is observed;
But if A were true, C would be a matter of course,
Hence, there is reason to suspect that A is true (CP 5. 189)

Abduction as a concept brings the participants together in a fellowship. The biosemiotician Jesper Hoffmeyer states in his chapter *Viden og kropp [Knowledge and body]*, that an abduction comes to act as a premise for a common assumption, namely that the world is fundamentally made of the same stuff as our own body. Hoffmeyer, furthermore, in his chapter argues that projecting our own physical experience of causality onto a non-causal world, and actually gaining a

¹ The book is written in Danish and Norwegian because of our ambition to reach out to a broader public than the customary academic one. Because the book is under publication there is no reference to page numbers.

² The term *field of possibility* is taken from Gilles Deleuze and Félix Guattari *Hvad er filosofi?*, see the Introduction by the editors of the Danish translation (København 1996: Gyldendal).

³ See Peirce's "The Maxim of Pragmatism": "Consider what effects that might conceivably have practical bearings we conceive the object of our conception to have: then, our conception of those effects is the whole of our conception of the object." (*The Essential Peirce* 1998b: 135)

credible knowledge of it, makes it possible to abductively join a world which is made of fundamentally the same stuff as oneself. According to him, causality results from physically anchored experiences gained through our lives, going back to our first actions as an infant; it does not result from an a priori. The Norwegian literature researcher Elisabeth Løvlie, in her chapter *Jeg vet noe jeg ikke vet* [*I know something that I do not know*], draws in the newborn infant's so-called *amodal perception*, a form of knowledge that is immediate and incomprehensible. She maintains that new experimental science makes it ever more clear that the body possesses this special kind of knowledge which does not rely on reflection. An infant has an immediate experiential and developmental relationship to its environment. These experiences are based on effects and causality, and thereby on learning.

This type of knowledge has long been a prerequisite for aesthetic and literary thinking and has been something which attempts have been made to attain, among others by emphasizing the aesthetic experience. The work that the Danish historian of ideas and philosopher Dorthe Jørgensen did on Gottlieb Baumgarten's sensitive aesthetics of the 1750s in *Den skønne tænkning* [*The Beautiful Thinking*]⁴ (2014) has increased our reflection on the epistemological meaning of the art forms. In this project, we have therefore seen the field of possibility as a space where the body's abductive, prelogical guesswork can encounter the sensitive aesthetics of Baumgarten. The ability to have sensitive imaginations is a bodily capacity, but it is not only a matter of sensations, but also emotions, perceptual judgments and anticipations.

We propose, in other words, a similarity – or rather, a common ground – between abduction and aesthetics as it is conceptualized by Baumgarten and formulated in the chapters on esthetical phenomenon in this book. Our field of possibility is where hypothesis are born. The assertion of the existence of a common ground between what, we could view as a biological logic and aesthetics, functions as a legitimation of our elaboration of an interdisciplinary field.

1. Abduction is Real

But if we acknowledge the existence of something prelinguistic or presemiotic, we can at least attempt to form concepts that can limit the determinism in the world of ideas that we inhabit as creatures of language and symbolism. In the arts, it has always been accepted that a reality exists before we have formed our ideas about it. This is why the humanistic-aesthetic contributions to this book play an important role in the development of concepts. After all, aesthetes have strived to say that which cannot be said, that which concerns physical effects, feelings, interactions and causality. Perhaps the aesthetic disciplines are better than other disciplines in capturing the living aspects of language? Considering the great discoveries that are being made in biology and related fields of exact science, I believe it is only natural that humanists and biologists will eventually meet in the field of activity, in abduction's field of possibility.

Clearly, Hoffmeyer's chapter also functions on another fundamental and related premise, namely that in this book we base ourselves on an epistemological and semiotic realism in Peirce's sense of the word. This realism implies a break with Kant because every organism is in a perpetual causal, and therefore realistic, relationship to its environment.

Realism is based in something which comes before the sign, for instance in the immediate interaction that an infant has with its environment. Frederik Stjernfelt, in his *Diagrammatology*, emphasizes something of great interest within our context, namely that Peirce, who considered all mental and physical processes to be sign processes, maintains a realism which implies that something fundamental and real must exist before the sign. In line with Husserl's views, that which exists before the sign must be based on a *metaphysics of presence*. Peirce offers a *present instant*, something which has not yet been mediated through the sign. Peirce's term for this pre-

⁴ Aarhus 2014: Aarhus Universitetsforlag.

mediated something is icon. An icon is not a complete sign. It has the capacity to communicate various aspects of experience in the present moment (Stjernfelt 2007: 29). The index, which is the existential, experiential sign, always incorporates an icon.

Not only is it important, in relation to Peirce's realism that something exists before the sign process begins, but we must also acknowledge that the icon, because it is not a fully realized sign, stands for something that is not realized but only a possibility. The icon is an aspect of an actualization of reality, but exists in itself only as something possible, something that can come to be. A semiotically realistic perception of man and of the universe therefore relies on something (existing in the perceptive process) that is hypothetical, potential and possible (or more likely abductive) rather than actual.

If we assume it to be true that we have a biological ability to anticipate the consequences of choices, as Hoffmeyer argues even the simplest of organisms has, then we should be able to state that the possible is an important factor in this ability to recognize. And we can then argue that the possible is as real as the actual; it just has not yet been realized at an indexical level as an actual experience.

Also playing an important role in Peirce's realism is that the iconic sign, which exists as something potential, as something not yet realized in this world or actualized as an idea, also carries a possible generality (Stjernfelt 2007: 29). The fact that something exists that is not related to the actualization or mediation (we could also say symbolization) may, in Peirce's understanding of what is real, his realism, also include the general and thereby universal, as we have heard.

2. When the Possible is Real, are Concepts also Real?

Peirce's realism includes the idea that universals exist and are real. They are found in legitimate forms such as tendencies, dispositions, and patterns, and these can exist not just as actually existing but also as possibilities. Universals are products of consciousness, but are based in the possible (Stjernfelt 2007: 35). Because the presemiotic exists as a possibility that leads to actualization and conscious thought, we can safely speak of a form of precognitive *knowledge*, and we can also place concepts in this category. Concepts are legitimate and therefore possibilities, as Deleuze also stated. They actually exist in this world, even if we cannot observe or measure them. They are as invisible as consciousness is, but we would not deny that there is such a thing as consciousness, would we? Stjernfelt connects Peirce's idea of realism to the idea that the universal "is through and through a product of the mind, but this creation has in certain cases a basis – a condition of possibility" (Stjernfelt 2007: 35).

This ability to be possible or virtual is what is articulated by poetic expression indirectly and in spite of the medium being verbal.

3. Abduction and Perceptual Judgments

In his book *Kant and the Platypus. Essays on language and cognition*, Umberto Eco states that, to Peirce, perceptual judgment was the starting point for all critical and controlled thought. He saw perception as a process ending in perceptual judgment. But the process begins with what Peirce called the percept. The percept is not yet a perception; it is a first stimulus that is "an index of the fact that there is something to perceive" (Eco 1997: 114). The percept is somewhere between icon and index. Something appears, but this something is still unclear and does not require any sense: "It is pure individuality, in itself *dumb* (1997: 114). Already in the perceptual judgment, primary iconism shades off into a generic equality (...)" (Eco 1997: 115). The moment we get an impression, its singularity – its characteristic of being a unique event – has changed into something universal. In Peirce's terms, we have reached thirdness, that is to say, the sign as well as its rationality and interpretation.

So, perception ends with perceptual judgment, and Peirce argues that "... abductive infer-

ences shades into perceptual judgment without any sharp line of demarcation between them” (*The Essential Peirce* 1998a: 227). The perceptual judgments can therefore be considered extreme cases of abductive inference “in being absolutely beyond criticism” (1998a: 227). In other words, behind abduction, as hypothesis-generating inference, there is something that is considered to be absolutely certain. And that which is absolutely certain does not belong to our cognitive level of consciousness, but to something precognitive. This is how Stjernfelt puts it: “the inferences at stake in perceptual judgments are of a peculiar type – they take place without any control and are immediately given without any possibility of doubt” (2007: 332). Hoffmeyer introduces the concept of perceptual semiotics in his chapter. An example of perceptual semiotics is an impression on the retina resulting in a coordination of the brain between perception and memory. This may be the cause of a physical feeling of certainty “that can make us ‘believe’ with a surprising certainty, without any involvement of consciousness”. Here, Hoffmeyer in his chapter provides a biological explanation for the perceptual judgments’ physical sense of certainty. The perceptual judgments are perceived as belief.

In reference to Peirce, Umberto Eco calls that which precedes cognition, and is a prerequisite for abduction, primary iconicity. The very first, that which sets the perceptual process in motion and which, following the perceptual judgment, leads to semiosis or the process of interpretation, does not exist as an object or a phenomenon, as we have seen. In some ways, it does not exist at all. Nonetheless, this is the prerequisite for everything that follows. Peirce considered this primary iconicity to be pure qualia (quality) and pure possibility (Eco 1997:100–101).

The biosemiotician Kalevi Kull in the article “Where we are now in discovering the basic mechanism of meaning-making” refers to Umberto Eco’s concept of primary iconicity and indexicality in *Kant and the Platypus*, stating that Eco has demonstrated that the icon is a sign that not only reflects similarity, but also actively acts in a similar way (2012: 16). The prerequisite for all abductive activity therefore is that something appears, and that something, which does not have any substantial or phenomenal existence, nevertheless has an influence, and we could call this a performative ability. Something is done in a similar way (in our perception).

This agrees well with the emphasis that Kull places on the ability of primary iconicity to create similarity: possible similarities are realized as similarity through the index. It is here that abduction has a function. Something has actually become similar, at least in a hypothetical sense.

4. Qualitative Possibility, Consciousness and Experience

Can that which only exists as a qualitative possibility play a decisive role in human existence? In his two chapters in our book, one on the reality of the phenomenology of the body and one on the cybersemiotic component in the semiotic paradigm⁵, the Danish biosemiotician and philosopher of science Søren Brier states that abduction is tied to the creative part of the human ability to know. Fascinatingly, the creative element is tied to the possible rather than the actual – to that which we are able to categorize or about which we are able to theorize. Hoffmeyer’s book from 2012, *Overfladens dyp [The Depth of the Surface]* examines how evolution has been able to produce a phenomenon such as mental life, and argues that the psyche’s role in nature is to bring the world into the organism and the organism into the world (2012: 7). From this thesis follows the assertion that consciousness is a surface or *interface*, a place without materiality which nevertheless is real, a place for communication between the brain and the world beyond. That which characterizes the consciousness seen as an interface is that it is predictive.

What Hoffmeyer is saying by this is that large parts of our cognition is subconscious and related to the organism’s own anticipatory life. I believe it is this subconscious cognition that so

⁵ The titles of the chapters are: “Kropsfænomenologisk virkelighed: En cybersemiotisk transdisciplinær forståelse” and “Cybersemiotics; At indsætte den kybernetiske komponent i det semiotiske paradigme.”

concerns the aesthetics in this book, and which is expressed in Løvlie's chapter because she so explicitly relates it to the infant's immediate relation to the world. But such an immediately and physical cognition can only be expressed as a qualitative possibility. It can of course never be formulated in language or be expressed as a symbolically mediated sign.

Consciousness or psyche has served a function in evolution – it has enabled the organism to better interact with its environment. On the other hand, it does not exist as a physical, measurable quantity. It does not have any weight, volume, color, or substance. And, so Hoffmeyer warns, it cannot be reduced to the method of functioning of certain neural areas, but exists by virtue of the brain's billions of communicative processes. Like psyche, Hoffmeyer asserts that the capacity to experience has developed in the course of evolution with the aim to better equip the organism to handle challenging situations. This means that experiential existence must be connected to the organism's range of possible activities. And, he stated that we humans build layers upon layer on top of our immediate experiences, giving our experiential existence a multidimensional character which makes it hard to imagine how its appearance can be explained purely biologically. Accordingly, both the psyche or consciousness and the capacity to experience have a biological function.

However, as stated, such subconscious knowledge cannot be directly communicated. On the other hand, all of the participants in the project, which belongs to the aesthetic disciplines, will say that it can be staged indirectly in the aesthetic expression, be it musical, literary or theatrical. In other words, our hypothesis implies a perspective that is not only biosemiotic but interdisciplinary – because we believe that art can express that which the body knows and keep abduction alive. We further believe that this can be experienced and that it has an epistemological function.

What both the humanities and the natural sciences need is a common grasp on the nature of change, creativity and freedom on one side and constraints and stability on the other. In order to establish such a field of research the natural sciences and the esthetic disciplines must cooperate to keep open the immediate quality of the possible.

WAITING FOR HISTORY. ON THE EVE OF EXPLOSION

Laura Gherlone
CIFAL, Faculty of Languages,
University of Cordoba, Argentina
laura.gherlone@gmail.com

Abstract

In 1989 Yuri M. Lotman, together with his Tartu semiotic School's colleagues, proposed a space of reflection about "The great French Revolution and the Ways of the Russian Liberation Movement", in commemoration of the 200th anniversary of the great event: as if to assess the situation, he underlined the necessity to anchor the semiotic research in the horizon of historical sciences, in order to comprehend the deep links that exist between culture and history, language and plot, world view and conception of time.

Lotman dwelt in particular upon the concept of "mechanism of Troubles" [*mekhanizm Smuty*], hypothesizing a comparative historical semiotics [*istoricheskaya semiotika*] able to elaborate macro-typologizations of the historical movements (or rhythms).

This paper intends to deal with Lotman's vision about the relations between cultural semiotics and cultural history, referring in particular to the textual corpus of Lotman's last thought (1988-1993).

1. Introduction

This paper is devoted to Yuri M. Lotman and his long reflection on the so-called "semiotics of culture", an epistemological approach that he developed in his thirty years of research on the

relationship between language, meaning and collective intelligence.

His aim was to explain how extremely complex “organisms” such as cultures can develop their own models of self-consciousness and self-description, in other words, their cultural identity. This question is even more poignant when they are living in times of crisis, marked by the encounter and clash with the “alien” [*chuzhoe slovo, chuzhoe povedenie, chuzhoi mir*], or periods of transition [*promezhutok*] from a status to its “post” condition. These last reflections constitute the theoretical core of the three years preceding Lotman’s death, the period on which now I am going to linger.

Lotman was in fact aware that the period between 1990-1993 was seeing the maturation of an “other” thought in respect to the previous intellectual production. In fact, although there were clear lines of thematic continuity, in the early 90s (due also to his precarious state of health) his way of expressing and speculating abandoned such orderliness and made more and more use of intuition, analogies and memories – reflective “explosions”, we might say¹. He himself, as evidence of the need to give a physiognomy to this phase, had considered the idea of a potential collection of articles to be released by the publishing house, Aleksandra of Tallinn. The preface for the project is found in № 268 of Archive 136 (*Isikuarhiiv*) at the University of Tartu Library – a collection of 491 units, retraced by Tatiana Kuzovkina and Tatiana Shakhovskaya, in the 3-year period between 1997–2000.

However, we can undoubtedly state that Lotman’s last thought is represented by the three monographs: *Culture and explosion* [*Kul’tura i vzryv*], *Unpredictable mechanisms of culture* [*Nepredskazuemye mekhanizmy kul’tury*], *Inside the worlds of thinking: people – text – semiosphere – history* [*Vnutri myslyaschikh mirov: chelovek – tekst – semiosfera – istoriya*].

The first was written in 1991 and published in its final form in 1992². The second was drafted in 1990 under the title of *Physiology of explosion. On the transitional periods in history* [*Fiziologiya vzryva. O perekhodnykh periodakh v istorii*]. Between 1991 and 1992, this version was followed by two others and a first publication in 1994 (in a short form) on the *Valgaskii arkhiv* (the first integral version appeared in Italian in 1994, while the final Russian version came out in 2010 by the Tallinna Ülikooli Kirjastus and the English one in 2013 by the same publishing house). Finally, the third monograph – which consists of three rather independent parts, drafted at different times (I. The Text as a meaning-generating mechanism; II. The semiosphere; III. Cultural memory, history and semiotics)³ – was written in 1988 at the request of I.B. Tauris and therefore published in English under the title of *Universe of the mind. A semiotic theory of culture* (the Russian edition came out in 1996 by *Yazyki russkoj kul’tury*, Moscow).

2. History

As we can deduce from the titles, between the late 80s and the early 90s Lotman was interested in the “physiology of the explosion”, namely the ways through which cultures overcome the periods of historical transition, creating unusual forms of semioticity: new metaphors in language, new customs in byt (or daily life), new and old forms of theatricality in gestures and behaviour, new literature (“literary fury is linked to political immobility”, Lotman [1994] 2013:

¹ Having adopted a metaphorical and intuitive language which is less systematic than previous works, the “last” Lotman is in fact often dismissed as his “evocative phase”. This rushed assessment has reduced the importance of his thought which, although it contains certain ideas just *in nuce*, stimulates and noticeably contributes to semiotic science’s international debate and to the demands that have been urgently rising in the field of language sciences, especially in the horizon of the ethics of social communication. Related to this, we can notice that the understanding of the so-called “semiotics of culture” is not always comprehensive, and is often treated as a “toolbox”: very useful for pulling out interesting interpretive “devices” but poorly understood in its entirety, both in relation to the author – who, over time, has attributed this to the different epistemological nuances – and to the semiotic science as a whole.

² The latest version with further revisions and additions was published in Lotman 2000.

³ I. *Tekst kak smyslo-porozhdayuschee ustrojstvo*; II. *Semiosfera*; III. *Pamyat’ kul’tury. Istoriya i semiotika*.

160)⁴, and new forms of “semiotics of fear” [*semiotika strakha*].

According to the Scholar, the semiotic workings is what allows culture to interpret and interiorize the ongoing change, seeing it as an a priori encoded step, or as a moment of total, *unpredictable* opening. Several of Lotman’s unpublished writings from the period between 1990–1993 are deeply linked to the three monographs and jointly thematize this interpretative “bifurcation”⁵ of the historical crisis: towards newness or towards repetitiveness:

- № 266 *Repetitiveness and uniqueness in the mechanism of culture (Povtoryaemost’ i unikal’nost’ v mekhanizme kul’tury. Chernovaya rukopis’, 1991–1992, manuscript, pages 14).*
- № 271 *Evolution – complication or simplification (Evolyutsiya – uslozhenie ili uproshchenie, 1991–1992, manuscript, 14).*
- № 272 *Waiting for language (on the eve of the explosion) (V ozhidanii yazyka (nakanune vzryva), 1992, manuscript, 21).*
- № 273 *In an open world (V otkrytom mire, 1992–1993, manuscript and typescript, 28).*
- № 279 *Repetitiveness and explosion in dynamic processes (Povtoryaemost’ i vzryv v dinamicheskikh protsessakh, autumn–winter 1992, manuscript, 15).*
- № 282 *Breakthrough outside the space. The boundaries of the infinite (Proryv za predely prostanstva. Granitsy bezgranichnosti, 1992–1993, manuscript and typescript, 37).*
- № 286 *The present day between East and West (Sovremennost’ mezhdru Vostokom i Zapadom, 1992, typescript, with changes dated 1997, 41).*

The thread that ties these writings together is the adoption of the Russian chemist and physicist Il’ya R. Prigozhin’s theory of complexity, as an interpretative framework for understanding the dynamics of culture. According to Lotman (Lotman 1990: 230), his reflection, enriched by Isabelle Stengers’s works,

has revolutionary significance for scientific thinking as a whole because they have tackled the problem of chance in the sciences and have moreover demonstrated the function of random phenomena in the general dynamics of the world.

имеют глубокий революционизирующий смысл для научного мышления в целом: они вводят случайные явления в круг интересов науки и, более того, раскрывают их функциональное место в общей динамике мира. (Lotman 2000: 348)

Lotman introduces the concept of “non-equilibrium” thermodynamics to explain the moments of historical explosions – those moments when unpredictable paths seem to open, moments in the face of which human beings must make a choice. This may consist in the reiteration [povtorenie] of already experienced cultural plots or in the responsible acknowledgement of the “dark night” (the crisis), in search of the ongoing “day” (the creativity and the newness): “In such times a clearly formulated question or even a profoundly experienced doubt turns out to be more productive than customary answers reiterating customary truths.” (Lotman [1994] 2013: 37)⁶. According to Lotman, the Russian Revolution was precisely an example of a customary,

⁴ “словесное неистовство сочетается с политической скованностью”.

⁵ Word based on Prigozhin’s theory and reread by Lotman in order to explain the dynamics of historical changes, when “the potential of all possible future paths of development” seems to be feasible (Lotman [1992] 2009: 14). See also Grishakova 2009.

⁶ “Ясно поставленный вопрос или глубоко пережитое сомнение оказываются в такое время более плодотворными, чем привычные ответы, повторяющие привычные истины.”

“usual”, imitative answer to the crisis underway, which followed the script of the French Revolution (uniting it with the typical “hyperbolism” of the Russian mentality) in order to overtake the historical stalemate – the Scholar termed this phenomenon “mechanism of Troubles” in memory of the Time of Troubles [Smutnoe vremya, 1598–1613] (significantly, in 1989 he promoted a community reflection about this topic during the conference “The great French Revolution and the ways of the Russian Liberation Movement”⁷).

These considerations introduce another important theme of the last Lotman: the role of art in the dynamics of culture. In this regard, the unpublished articles

- № 293 *The role of art in the dynamics of culture (Rol' iskusstva v dinamike kul'tury*, May 1993, manuscript, typescript, 81).
- № 278 *Fire in the vessel (Ogon' v sosude*, 1992–1993, manuscript, typescript, 26).
- № 280 *Portrait (Portret*, 1992, manuscript, with changes dated 1993 in typewritten form, 107).
- № 270 *The function of art (Funktsiya iskusstva. Chernovaya rukopis'*, 1991–1992, manuscript, 43).

are linked as much to the aforementioned monographs as to the tele-lectures on Russian culture that Lotman gave from 1985 to 1991 for Estonian Television (*Eesti Televisioon*). In 1990 he recorded the 4th series of lectures on *Man and art [Chelovek i iskusstvo]*, which was followed by the 5th and final series on *Pushkin and his entourage [Pushkin i ego okruzhenie]*⁸.

Art is a key dimension of the Lotmanian theory, perhaps the most important one. Since the 60s, analyzing the poetic and literary texts according to a structuralist approach⁹, Lotman became progressively aware that “The artistic work is a thinking structure, a generator of new information. Art is one of the hemispheres of the collective brain of humankind.” (Lotman [1994] 2013: 220)¹⁰. The study of this kind of language suggested to him that if we want to understand the culture (synonymous with kollektivnyi intellekt), it is necessary to analyze its expressive (or artistic) forms, which are thinking-generating “devices”. Their cultural function consists not only in the mere transmission of information, but in the production of a semantic excess, which means newness, unpredictability, uniqueness and evolution; the art forms have such a semiotic capacity that they can be “modelling” [modelirovanie] (also translated as “modelising”)¹¹: in other words the art forms are able to return the essence of the extra-cultural reality to the culture, causing a never-ending dialogue between the culture in itself (the “known” world), and what is beyond its boundaries and requires a modelisation¹² (Lotman [1992] 2009: 73).

Lotman writes (Lotman [1994] 2013: 171–172):

⁷ *Velikaya Frantsuzskaya Revolyutsiya i puti Russkogo Osvoboditel'nogo Dvizheniya*.

⁸ The three previous series dealt with the relationship between people, fate and everyday life [*byt*] (1st), people and development of cultures (2nd), and culture and intelligence (3rd). Thirty-three lectures were recorded in all by Eesti Televisioon and published in Lotman 2003.

⁹ *Analiz khudozhestvennogo teksta*. 1960 (unpublished); *Lektsii po struktural'noi poetike. Vvedenie, teoriya stikha*. Tartu 1964; *Struktura khudozhestvennogo teksta*. Moskva 1970; *Analiz poeticheskogo teksta. Struktura stikha*. Leningrad 1972.

¹⁰ “Художественное произведение – мыслящая структура, генератор новой информации. Искусство – одно из полушарий коллективного мозга человечества.”

¹¹ Art has “an extreme degree of freedom in modelling reality. The freedom of artistic modelling is guaranteed by the fact that works of art are always a breakthrough into the new, into a sphere of artistic language that was until that point non-existent. Every work of art is a new text in a new language.” (Lotman [1994] 2013: 200).

“[...] предельную свободу моделирования реальности. Свобода художественного моделирования обеспечивается тем, что произведения искусства всегда есть прорыв в новую, до тех пор не существовавшую, сферу художественного языка. Каждое произведение искусства – это новый текст, на новом языке.”

¹² “Modelization” in AmE.

The function of art in the general system of different cultural spheres involves the creation of a reality much freer than the reality of the material world. [...] The meaning behind the old definition of the “arts” as “liberal” is profound and perhaps not fully understood. [...] objects of art constrained by the laws of reality acquire freedom in art, enter into new relations and bonds whereby they reveal their deep inner meaning.

Функция искусства в общей системе различных сфер культуры и состоит в том, что оно создает реальность, гораздо более свободную, чем реальность материального мира. [...] Старинное определение искусств как свободных имеет глубокое, возможно, не всегда осознававшееся значение. [...] скованные законами реальности объекты искусства получают в нем свободу, вступают в новые отношения и связи, тем самым раскрывая свои глубинные внутренние значения. (Lotman [1994] 2010: 140-141)

In Lotman’s thought and, more generally, in the Tartu-Moscow School’s theoretical framework, art has not only paved the way for the investigation of the text as a meaning-generating mechanism (essential for understanding the dynamics and the semantic richness of the culture in terms of new information) but it has marked the scientific and ethical-anthropological breakthrough towards the thematization of the explosion: “For the Tartu-Moscow School the shift from gradual processes to explosive moments was determined when the centre of scholarly attention was relocated from the field of linguistics to the semiotics of art. Art is the child of explosion.” (Lotman [1994] 2013: 87)¹³.

It is not by chance that Lotman defines art a “laboratory (or workshop) of unpredictability” [*masterskaya nepredskazuemosti*]: the reality receives freedom from art, saving itself from utopia and from the “usual”, bearer of already beaten paths or customary truths.

3. Everyday life

Lastly, a well-beloved topic by Lotman is everyday life, often regarded as a “low”, residual phenomenon in respect to the great events of history or cultural events, everlasting in the cultural memory. As stated by the Scholar, there is a sort of recursiveness between the history of humanity and that of the individual, according to a dynamic of mirroring or isomorphism (Lotman 1994a: 389) which gives life to the culture, where the daily gesture, collectively lived, is kept in the memory of history.

This reflection is well represented by the monograph dated in the summer 1992, *Literature in the context of the 18th-century Russian culture* [*Literatura v kontekste russkoj kul’tury XVIII-go veka*], published in Russian in 1996 in the 4th volume of the miscellaneous collection *From the history of Russian literature. 18th – beginning of the 19th centuries* [*Iz istorii russkoj kul’tury. XVIII – nachalo XIX veka*]¹⁴. This is specular to the Lotmanian collection dated 1994 *Conversations about Russian culture. The way of life and traditions of Russian nobility (18th – beginning of the 19th centuries)* [*Besedy o russkoj kul’ture. Byt i traditsii russkogo dvoryanstva (XVIII – nachalo XIX veka)*]¹⁵.

¹³ “Для тартуско-московской школы переход от постепенных процессов к взрывам был запрограммирован перемещением центра научного внимания из области лингвистики в семиотику искусства. Искусство – дитя взрыва.”

¹⁴ The first part of the volume was written by Lotman and bears the title of *Ocherki po russkoj kul’ture XVIII veka* [*Essays on the 18th-century Russian culture*]: Chapters 1, 2 and the Conclusion constitute the monograph *Literatura v kontekste russkoj kul’tury XVIII-go veka*.

¹⁵ This collection dated 1994 expounds the theme of the byt. Some parts of it are repeated in chapter 3 of the aforesaid volume

Lotman reviews the themes developed since the sixties, when his interest was directed to the genesis of historical phenomena such as the Russian Enlightenment, the post-Petrine era, the Decembrist current, to name but a few: a genesis that Lotman locates both in the great authors (Radischev, Pushkin, Tolstoy, etc.) and in the *byt* embodied in history, as revealed by the meaning systems of ranks, honors (uniforms, medals, titles), duels, matchmaking, women's education, games, dandyism, and domestic and urban architecture. In the essay *Architecture in the context of culture* (*Arkhitektura v kontekste kul'tury*, 1987), Lotman underlines that all that surrounds us (or the symbolic space) is the result of a thick semiotic dialog between the architectural organization – in and of itself historically stratified and full of meaning – and the non-architectural one (i.e., the ritual, daily, religious, mythological semiotics). This spatial-temporal dialog creates complex systems of codification of the cultural memory and casts light on the present: present which is interpreted through the workings of daily life. Being particularly interested in the historical crisis, Lotman emphasizes the close connection between the “great” space-time – represented by “the layout of Valletta (in Malta), Nancy, Petersburg, Lima”¹⁶ or by Tolstoy's *Anna Karenina* (Lotman 2000: 679–680) – and the “little” space-time: according to the Scholar, people invent various forms of etiquettes, rituals, norms of behaviour, and subdivisions of domestic spaces¹⁷ in order to interpret, mediate and “control” the change, the reason for which the cultural researcher has to search for the symptoms of historical passages in scenicity and in the theatricalization of daily life. These passages will be viewed as more “scenic” as they are bearers of uncontrolled news.

POPULAR MUSIC AND SIGNS OF TIMES. ROMANCES DEDICATED TO BUCHAREST

Mariana Neț
Romanian Academy, Institute of Linguistics,
Bucharest, Romania
mariana_net15@yahoo.com

1. Introduction

There are many ways in which cities and their images can survive times. Sometimes they are evoked in novels, memoirs and diaries. Most cities are described in guidebooks. Others are painted or, since 1894, when cinema was invented, some cities have visible and “moving” icons. But cities can also have audible icons. Music is one of them.

Some cities are immortalized in symphonic pieces. The best known examples are Vienna as evoked by Johann Strauss, Rome in the concerts of Ottorino Respighi, and Aranjuez as in the famous concert by Joachim Rodrigo. In Germany, *Berliner Luft* by Paul Linecke is an operetta composed in 1904 on a Viennese model. Various Italian cities, such as Napoli and Sorrento, as well as some Spanish cities, like Valencia and Granada, were dedicated *canzonette*. Such songs can be traced back to the end of the 19th century; they flourished in the former half of the 20th century. The first pieces of popular music dedicated to New York City also date from the turn of the century; *The Sidewalks of New York*¹ was composed in 1894 and immediately became a hit. Back on the other side of the Atlantic, the Parisian *chansonnettes* were *en vogue* in the 1920s, although the *chansonette* as a genre existed before the French Revolution.

¹ Music by Charles B. Lawlor, lyrics by James W. Blake

2. Argument

The songs dedicated to cities are signs of time, place, mentalities and ideologies. As Eero Tarasti explained (2002: 4), “Music mediates between values, be they aesthetic, ideological or whatever – and fixed ready-made objects”. And further: “Music can ‘speak’ for a given ideology” (2002: 24). On the other hand, Tarasti emphasized that “Music is largely indifferent to the ideologies or political-historical situations in which it is realized” (2002: 25). But the texts on which songs are based are not indifferent to ideologies and political-historical situations either. They play an important part in this respect. Musical texts *express* – or at least *evoke* – ideologies and political situations.

This essay will be a survey of the *romances* dedicated to Bucharest, from a broad semiotic perspective. The research will refer to the romances’ texts to a greater extent than to their music.

The Romanian *romance* is a fluid genre, easy to recognize, although not so easy to define. It is a short, naive piece of lyric popular music. Its text always tells a story – a love story, which is sometimes happy and optimistic, albeit in most cases sad or at least nostalgic. The Romanian romance flourished in the 1930s. Then their music was a tango or a waltz, but it was also bossa-nova, rumba, foxtrot and jazz. Sometimes, though not too often, the romances’ tunes evoked Romanian folklore.

This endeavour proves rather difficult, as very little research has been done in this respect. Most of the basic information necessary for this research has been found in a few books: Deda (1968: *passim*), Caraman-Fotea (1989: 43, 283), Sbârcea (1984: 145, 202), Ghiață and Sachelarie (1966: 275), as well as on various LP and Cd covers.² The list of songs dedicated to Bucharest (http://ro.wikipedia.org/wiki/List%C4%83_de_c%C3%A2ntece_legate_de_Bucure%C8%99ti) to be found online has proved useful, too. However, the online discography mentions several pieces, but is incomplete as regards the authors of music and lyrics; sometimes it explains that the texts are unavailable. The launching year may also be uncertain. Anyway, this presentation only refers to those pieces which are available (which I could either read or listen to). Some songs have been lost, probably for ever; they are referred to in some memoirs and diaries or they survive in some old people’s recollections. While the bibliography in this respect is quite scarce, the discography is also incomplete. This survey will comment upon a few pieces deemed to be symptomatic for various epochs and ideologies. The discussion will follow a chronological order.

3. The origins

The origins of Romanian romances are to be found in the music and lyrics composed by Anton Pann (1790-1854) in the former half of the 19th century; perhaps, even before that moment. Probably the first romance in the present-day sense of the term dates from the latter half of the same century, when D. G. Florescu (1827-1875) composed the music for the poem *Steluța* (Little Star) by V. Alecsandri (1821-1890). In 1887, Iancu Filip wrote the music for two already famous poems by M. Eminescu (1850-1889): *De ce nu-mi vii?* (Why Don’t You Come?) and *Pe lângă plopul fără soț* (Under the Row of Poplars Odd). Eminescu’s poetry was on nearly everybody’s lips in those times, although most people probably understood only the first level of significance. Many turn-of-the-century musicians composed romances on his verse.

But it was in the inter-war era that romances were *en vogue*, though at the end of Communist times, they were still appreciated by many. One reason for this belated fame enjoyed by romances was that they reminded people (elderly people, especially) of the dead and gone inter-war era which they considered romantic (this was only too natural, since it was the time of those people’s childhood and youth). Another reason was that romances belong to popular culture; their message is easy to understand, their music is enjoyable, and therefore they appeal to a lot

² I would like to thank Mrs. Stela Covaci and Mr. Marian Stere for their kind support concerning the documentation.

of people of average – and even below average – cultural level. For this reason, the interpretation of romances was encouraged – even demanded – by Communist Power. For all these reasons, the romance, as a genre, can still be productive.

I contend there are three main moments in the evolution of Romanian romances dedicated to the city of Bucharest, namely (1) the *inter-bellum* era (also including the 1940s), (2) the 1950s, and (3) the years 1960-1980. Things became more complicated after 1990: a completely new kind of music was composed, while the songs' topic and vocabulary were very different from what they used to be, therefore entirely different from traditional romances. This presentation will stop before reaching that moment.

4. The Inter-Bellum Era

Two hundred-odd romances were sung and hummed in Bucharest in the 1930s. Among them, I have been able to identify only seven songs in which Romania's capital city or one of its landmarks are explicitly mentioned (not always in the title). The music of many of these songs was signed by Ion Vasilescu (1903-1960). They were sung by various stars of the time: Jean Moscopol, Cristian Vasile and Maria Tănase, as well as by Titi Botez and Dorel Livianu (who were just as famous at the time, in spite of being almost forgotten nowadays). Most romances were launched on *revue* stages such as Alhambra, Cărăbuș and Savoy or in various famous restaurants. Most recordings were then made at the Columbia studios in Vienna or at Odéon studios in Paris.

Probably the first romance dedicated to the city of Bucharest dates from 1932. It was a foxtrot titled *Fetițele din București*³ (The Girls in Bucharest). Under the slightly altered title *Fetițe dulci din București* (Sweet Girls of Bucharest), this romance was still a hit in Communist times, when it was sung by Gică Petrescu.

In the same year (1932) Jean Moscopol recorded the romance *Vrei să ne-ntîlnim sîmbătă seara?*⁴ (Shall We Meet on Saturday Night?). Another recording of this piece was made by Titi Botez in the following year; The song remained in the repertory of several popular music soloists until the 1970s. Its lyrics evoked a topos of inter-bellum Bucharest, namely the small pubs on Kisselef Avenue and on the adjacent streets, where live music was played on a piano and a violin.

It was also in the early 30s, probably on the occasion of the same journey to Vienna, that Jean Moscopol recorded at Columbia studios yet another romance referring to a city landmark, namely Cișmigiu Gardens⁵. *Te-aștept diseară în Cișmigiu*⁶ (I'll Wait for You Tonight in Cișmigiu). Interpreted by other singers⁷, this piece survived in Communist times.

Another famous romance, launched in 1937, was *Hai să-ți arăt Bucureștiul noaptea*.⁸ (Let Me Show You Bucharest by Night). Unlike the previously mentioned songs, in which the city supplied only the conventional setting of the love story, the text of this romance stages an imaginary journey through the city “from the (Royal) Palace to the Avenue”⁹ passing by the Athenaeum, going farther on Calea Victoriei¹⁰ and reaching “Miorița” fountain, one of the city's symbolic “gates.” It was at this point that the lovers were to declare their intense feelings. The text of this romance is close to that of Parisian *chansonnettes*. The declaration of love is addressed to the city

³ Music: Ion Vasilescu; lyrics: Nicolae Vlădoianu and Nicolae Kirculescu

⁴ Music: Ion Vasilescu; lyrics: Nicolae Vlădoianu

⁵ The garden, located in downtown Bucharest, dates from 1847. It was designed by W.F.C. Meyer, a Viennese landscaper. Cișmigiu Garden was the first public park opened in Europe.

⁶ Music: Ion Vasilescu

⁷ All references to Jean Moscopol were forbidden in Communist times; the artist had immigrated to the United States in 1945.

⁸ Music: Ion Vasilescu; lyrics: Eugen Mirea and Nicolae Constantinescu

⁹ Kiseleff Avenue, “the Avenue” for short

¹⁰ The main axis of Bucharest and its most famous street

to the same extent to which it is addressed to the beloved woman.¹¹ This romance was an immediate hit, while its title (“Shall We Meet on Saturday Night?”) became a verbal cliché. The piece was also interpreted by various singers in Communist times. However, it is interesting to note that its text was altered. From 1948 onwards¹², instead of “from the Palace to the Avenue,” it ran: “from downtown to the Avenue.” Any reference to the Royal Palace was completely banned from this popular music text and from any other text.

Inter-bellum Bucharest was a care-free city, whose inhabitants were completely devoid of any inferiority complex. This idea is illustrated by the text of *La margine de București*,¹³ (On the outskirts of Bucharest), a romance recorded by Gică Petrescu in 1939. It runs: “On the outskirts of Bucharest / In my street covered in dust and mud ...”¹⁴ This song set a trend which was to be turned to profit on a wide scale in Communist times. The best-known example in this respect, as regards both music and lyrics, is *La crîșma din Ferentari*¹⁵ (At the Pub in Ferentari)¹⁶.

Another relevant example is *Bucureștiul meu iubit*,¹⁷ (My Beloved Bucharest)¹⁸. While the *inter-bellum* tune was a waltz, in the 1970s this romance was sung on a tune reminding of folklore. Thus, while before the War the outskirts were subtly “urbanized,” in Communist times the city was surreptitiously assimilated to its outskirts and their dominant mentalities.

In 1939, during the blackout, the romance *en vogue* was *Te recunosc și pe întuneric, București*,¹⁹ (I Recognize You Even in the Dark, Bucharest)²⁰, a true “anthem” dedicated to the city. In this love song Bucharest was shown to have preserved its charm and its system of values even during a world war and in complete darkness. This romance is reminiscent of the famous *Paris sera toujours Paris*²¹, sung by Maurice Chevalier about the same time and under similar circumstances. The romance *Cînd se sting luminile în București*²², (When the Lights Are Out in Bucharest)²³, sung on a slowfox tune and unavailable now, probably belonged to the same series.

The online discography²⁴ of popular songs dedicated to Bucharest also includes *La Șosea*²⁵ (On the Avenue), sung by the now forgotten Kosak Sisters at the beginning of the 1940s.

There are also a few hits which have never been recorded and which seem to have been lost forever, though they were frequently performed in revue shows at the end of the *inter-bellum* era. Such an example is *Ne-a văzut tot Bucureștiul împreună*²⁶, (Everybody in Bucharest Has Seen Us Together), almost unknown nowadays.

Many *inter-bellum* romances made use of diminutives (lassie, little pub, etc.) which are no longer in use. The presence of such words confer the songs a kind of outdated charm.

5. In the 1950s. In Bucharest and about Bucharest

Three main directions are manifest in the musical texts dedicated to Bucharest in the 1950s: (1) they continue the *inter-bellum* tradition of speaking about the city or its neighbourhoods.

¹¹ This romance has never been sung by a woman and addressed to a man.

¹² The king of Romania was forced to abdicate on December 30, 1947.

¹³ Music and lyrics: Ion Vasilescu

¹⁴ All the texts are in my transcription from LPs and CDs and in my translation into English.

¹⁵ Music: Aurel Giroveanu; lyrics: Nicu Kanner

¹⁶ It was recorded by Gică Petrescu in the 1970s.

¹⁷ Music: Marius Georgian

¹⁸ Also recorded by Gică Petrescu in the 1970s

¹⁹ Music: Ion Vasilescu; lyrics: Ștefan Cristodulo și Vasile Vasilache

²⁰ Sung by Zizi Șerban

²¹ Music: C. Oberfeld; lyrics: Albert Willematz

²² Music and lyrics: Nicolae Kirișescu

²³ This romance was recorded by Gică Petrescu in 1940. The recording, the music and lyrics seem to have been lost.

²⁵ Music: Fromy Moreno; lyrics: Mircea Block

²⁶ Music: Ion Vasilescu

However, not a few texts also have a translation into Russian; in this case, it is the bi-lingual version that is recorded on disk and broadcasted on the radio or on television.²⁷ The last direction is represented by (3) those songs specially composed or adapted in order to celebrate the city's 500th anniversary.²⁸ Some romances fall into two categories or even into all three. That is why the following presentation will be only chronological.

For instance, the romance *În Bucureștiul iubit*²⁹ (In My Beloved Bucharest) had a Russian version, recorded by Jean Păunescu in 1950.

Two years later, Gică Petrescu recorded with Electrecord (the Romanian recording house) a second popular piece which was a declaration of love to the city. It was titled; *București, București*.³⁰ This artist would continue to sing Bucharest throughout his long life.³¹ In the following decades, he recorded some two dozen songs about the city; some of them were his own compositions. A few of these songs were revivals of *ante bellum* tunes, though their texts were slightly altered to comply with Communist ideology.

The songs about the city cannot be understood unless one is well acquainted with the city history. The romance *A mai înflorit o grădiniță în București*,³² (Another Little Garden Has Appeared in Bucharest) dates from the early 50s. Its text refers to the initiative of one of the city mayors to plant some flower beds and install a bench or two on the sites of former buildings which had been destroyed by bombs during World War II. This romance was short-lived; it did not outlive the little gardens it referred to, and its text has not survived either, except in a few people's memory.

The historiography of Romanian popular music also recorded the interesting fact that the already famous Maria Tănase went to the "Moși" Fair³³ and sang live the romance *În Tîrgul Moșilor*,³⁴ which was probably launched on that occasion.

The song *Podul Grant*³⁵ (Grant Bridge) also dates from 1959, though it is in no way connected with the city's jubilee,³⁶ celebrated the same year. The text evoked a landmark already existing in the city for half a century.³⁷ It also reminded, in fairly decent terms, that at the beginning of the Communist era, blocks-of-flats had been built on Calea Griviței, between Northern Railway Station and Constanța Railway Bridge: "From Grant Bridge / I proudly admire the new buildings / On the site where I grew up". The blocks-of-flats replaced the former buildings which had been destroyed by American bombardments.

On the other hand, the populist trend which had invaded all cultural spheres in the 1950s (actually until the mid-60s) was noticeable in popular music, too. An example in this respect is supplied by the text of the song *Calea Griviței*:³⁸ "It's early morning and the siren has buzzed / And the workers are already in place. / I'm one of them and I tell the lathe 'I'm here!' / I'm like the clock in the nearby railway station: always on time".

As already mentioned, in the sixth decade of the 20th century some light music pieces were translated into Russian. This happened especially when Romanian artists toured the USSR. For

²⁷ The Romanian Television Company was founded in 1957.

²⁸ The first official act mentioning the city of Bucharest dates from 1459.

²⁹ Music: Mauriciu Vesca; lyrics: Nicolae Nasta

³⁰ Music: Aurel Giroveanu; lyrics: Ion Socol

³¹ He died in 2006, aged 91.

³² Music: Henry Mălineanu

³³ The annual fair called *La Moși* had a century-long tradition in Bucharest. It had taken place in Obor neighbourhood during the latter half of May ever since the 18th century. This tradition was discontinued in the early 1960s.

³⁴ Music: Temistocle Popa; lyrics: Vlad Cebotenco

³⁵ Music: George Grigoriu

³⁶ It was interpreted by Gică Petrescu and the "Grigoriu" Trio.

³⁷ Grant Bridge was built in 1908.

³⁸ Music and lyrics by unknown authors; interpreter: Luigi Ionescu

instance, in 1959, Gică Petrescu recorded with Electrecord *Cîntec pentru prietenii din București*³⁹ (Song for My Friends in Bucharest). It was sung on a jazz tune. The text in Russian mentioned a few city landmarks, but especially the new blocks-of-flats and cinemas, whereas the refrain in Romanian explicitly confessed: “Now I sing for you, friends from far away, / And I feel you close by [...] / From Moscow I send you greetings, / Bucharest, my beloved city. / Fly to Bucharest, my tune, / As a friendly gift from Moscow.” This text makes us believe that the song dates from 1957, when the artist was on a tour in Moscow. It may have been meant as a counter-weight of the songs *M-am îndrăgostit de tine, Moscova*⁴⁰ (I Have Fallen in Love with You, Moscow) and *Te iubesc, Moscova*⁴¹ (I Love You, Moscow), recorded by Gică Petrescu with Apeleski Zavod, the Soviet recording house, in 1957. A belated echo of this trend can be identified at the beginning of the next decade, in 1961, when the same artist recorded with Electrecord, exclusively in Romanian, the song *Amintiri dragi din Moscova*⁴² (Dear Souvenirs from Moscow).

In 1959, on the occasion of the 500th anniversary of Bucharest, several songs were composed evoking the city. From various written, verbal and online sources, I have been able to identify four such pieces. Two of them were sung by Gică Petrescu. They were titled *București, București*,⁴³ (“Bucharest, Bucharest / You are my brother. / My beloved Bucharest / How did you manage to charm me? / Whenever I’m away from you / I’m yearning to come back.”) and *Cele mai frumoase fete*⁴⁴ (The most beautiful girls) – to be found, obviously, only in Bucharest.

The song *Frumos ești, București*⁴⁵ (“How beautiful you are, Bucharest!”) probably dates from the same era.⁴⁶ Even if this song was composed a couple of years earlier,⁴⁷ the hypothesis is perfectly plausible that it became a hit on the occasion of the jubilee.

Paradoxically enough, the most symptomatic piece connected with the city’s anniversary was not an ad-hoc creation but the revival of a song from before the war. It is titled *Salutare, bătrîne București*⁴⁸ (Hello, Old Bucharest) and it dates from the 1930s. The text from before the war, written in the first person singular, told the story of a composer coming back to the city after a fairly long absence and promising never to leave it again: “Hello, old Bucharest, / I’m back to you after long years, / Beloved city of my childhood, / Never will I leave you again.” The text from 1959 introduced an explicit reference to the jubilee: “Hello, old Bucharest, / It’s your birthday, you are 500 now.” That is why, to the generations born after the war, this song has always evoked the jubilee.

A salient feature of the songs dedicated to Bucharest in the 1950s is a (fleeting) reference to the slums. Sometimes the slums – Obor, Colentina – were explicitly mentioned. Another feature is the mention of the new blocks-o-flats, of which the era was extremely proud – most often without reason.

6. In Bucharest and about Bucharest in the ’60s, ’70s and ’80s.

All the already mentioned tendencies are rendered manifest in the last three decades of Communism. The online discography includes about fifty titles, but, once again, the information is incomplete. In what follows, I will mention only those songs which, by both expression and content, are closest both to *ante bellum* romances and to Parisian *chansonnettes*.

³⁹ Music: Modest Tabacnicov; lyrics: I. Helemski și C. Pastramii

⁴⁰ Music: Elly Roman

⁴¹ Music: Nicolae Kirculescu; lyrics: Constantin Cârjan

⁴² Music: Arno Babedjabyan; lyrics: Eugen Mirea

⁴³ Music: Ion Vasilescu; lyrics: Nicușor Constantinescu and Aurel Felea

⁴⁴ Music: Henry Mălineanu; lyrics: Nicușor Constantinescu

⁴⁵ Music: Radu Șerban; lyrics: Ion Socol

⁴⁶ It was sung by Anca Agemolu.

⁴⁷ The online bibliography indicates the year 1952.

⁴⁸ See note 20.

Gică Petrescu continued his career of singing light music pieces and interpreted several romances dedicated to Bucharest; in some cases, he also composed the music of such songs. *București, București*⁴⁹ is a declaration of love – hyperbolic, naive, but sincere – addressed to the city: “*Bucharest, Bucharest, / So dear you are to me. / I’ve grown up with you. / I’ve watched you growing up, / You are so wonderful. /.../ Bucharest, Bucharest, / Those who love you / Have always sung songs about you. / Now it’s my turn to sing about you, / My beloved city.*”

The song *Undeva, pe-o stradă mică*⁵⁰ (Somewhere, in a Side Street) continued the style of interbellum romances in both music and lyrics. It was recorded by the same artist also in 1970 and it nostalgically refers to a patriarchal neighbourhood in the city and to a lasting love story which strengthened the lovers’ relation to the city: “*Somewhere, in a side street in Bucharest, / There is a house with geraniums on its window sills. / Our old photographs and souvenirs / Show images of the first time we met.*” The romantic love for a woman is equivalent to the lasting love for the city.

Much later – probably at the beginning of the 1980s –, Luigi Ionescu recorded the tango *Draga mea din București*⁵¹ (My Sweetheart from Bucharest), yet another song which seems to have survived from before the war: “*Where are you, my sweetheart from Bucharest? / Where are our hopes for love? / They’ve faded, like roses in autumn. / Where are they and where are you? / I remember some much-cherished neighbourhoods in Bucharest / Singing the songs of our hearts. [...] / I was walking in the streets by your side, / We felt so good [...] With half-closed eyes, I see images from the past, / As on a screen, I see the charm which is now over.*” The rhetorical question “*Where are they and where are you?*” seems addressed to the city to the same extent to which it is addressed to the beloved one, while the “*images from the past*” and “*the charm which is now over*” refer both to the city and to the former sweetheart.

It was also at the beginning of the 1980s that Dan Spătaru recorded *Noapte bună, București*,⁵² (Good-night, Bucharest!), yet another declaration of love to the city, in which the metropolis resembles the beloved one: “*Good-night, Bucharest, good-night! / Night has cast its secret veil. [...] My poem flies to you. / And whispers in all your neighbourhoods / Good-night, Bucharest, good-night! [...] Sleep well, my beloved city / And dream your sweet dreams! / Good-night, Bucharest, good-night!*” The message is clear enough; comments are superfluous.

Many new singers became famous in the 1980s. At the beginning of the ninth decade, Mircea Vintilă recorded the romance *Strada Popa Nan*⁵³ (Popa Nan Street); in a nostalgic, troubadour-like style, the song describes the obsolete lifestyles of one of the city’s patriarchal neighbourhoods which seemed to have travelled through times with very little change.

About the same time, Nicu Alifantis composed and sang a kind of “anthem” dedicated to the metropolis: “*You, Bucharest, city of poetry, / My garden with thousands of roses, / You tempt your poets to compose / Ballads to unforgettable loves.*” The text also refers, in a ludical key, to some of the best known poets who lived and wrote poetry in the city in the last two centuries (the Văcărescu Brothers, Eminescu, Minulescu, Bacovia), the implicit assumption being that Alifantis himself was among their descendants.

This ludic-nostalgic key is also characteristic of a waltz sung by Marina Voica in the mid-eighties: *București e Micul Paris*⁵⁴ (Bucharest is A Little Paris). Its mildly ironical text is conclusive enough: “*I sit by the window and watch / The city I love. /.../ Bucharest is A Little Paris [...] But then why don’t we speak / Of Paris as another Bucharest?*” This romance shows Bucharest

⁴⁹ Music: Gică Petrescu; lyrics: Cezarina Moldoveanu

⁵⁰ Music: Vasile Veselovski; lyrics: Mihai Maximilian

⁵¹ Music: Temistocle Popa

⁵² Music: Temistocle Popa; lyrics: Mircea Block

⁵³ Music: Mircea Vintilă; lyrics: Dorin Liviu Zaharia

⁵⁴ The names of the authors of lyrics and music are unavailable; so is the year of the recording.

to be a Narcissist city (the text mentions a few landmarks: Calea Victoriei, Cișmigiu Gardens, the Athenaeum, Kisselef Avenue), also endowed with subtle irony and the sense of proportions.

7. Conclusions

1. Cities are evoked, ludically and narcissistically, in songs, while the songs dedicated to the cities increase the cities' charm and strengthen their atmosphere.

2. As far as Bucharest is concerned, there is a clear difference between the romances composed before War World II and romances composed in the Communist era. The music of *inter-bellum* romances was up-to-date: songs were composed on partitions of tango, waltz, foxtrot, rumba, jazz and other fashionable rhythms of the time, while the romances composed in the Communist era preserved tangos and waltzes but often favoured tunes drawing inspiration from Romanian folklore or rather nondescript tunes which sounded obsolete. Paradoxically, the romances' music sounded more up-to-date during the last decade of Communism, when the composition was encouraged of nostalgic tunes reminiscent of generic troubadour music. Incidentally, this trend was also fashionable in European and North-American music in the 1980s.

3. A difference is also obvious as regards the romances' texts. Many *inter-bellum* lyrics were censored after the war, while the texts composed in the Communist era were more naive and redundant than before. Some of the romances composed during the 1950s, when Romania was occupied by Russian troops, also had a version in Russian, usually included in the same piece and sung alternatively with the Romanian version. Other texts spoke of the workers' enthusiasm in factories. While some romances continued to evoke a few city landmarks, many others spoke either of the slums or of the new blocks-of-flats. The obvious assumption was that before Communism came and built flats for the workers, most of the city had consisted of slums. It was an indirect way of legitimating the Communist Power, which had "urbanized" the city and the country by replacing the slums with "modern" blocks-of-flats. Communist historians and ideologists claimed this false idea openly. It is, once again, in the 1980s that texts became more sophisticated and closer to poetry.

4. The only common factor of the romances dedicated to Bucharest is the singers' love for the city.

5. As announced at the beginning, this research has been made from a broad semiotic perspective. But nowadays I find it almost impossible to do semiotic research without placing things in context, without being acquainted with history, lifestyles and ideologies. Sometimes, semiotics merges into cultural studies. This essay belongs to both disciplines.

CULTURAL SEMIOTICS AS *FLUXORUM SCIENTIA*

Massimo Leone
University of Turin, Italy
massimo.leone@unito.it

Abstract

The article is a caveat vis-à-vis the typological excesses of cultural semiotics. Structuralism naturally inclines toward the formulation of grids where cultural artifacts are recognized as tokens of types. Nevertheless, the article argues, such methodological attitude is not ideologically neutral. Pushed to the extreme, it risks overlapping with a politics of rigid articulation of humanity that 20th-century totalitarianisms tragically embraced. The antidote would be to pursue a paradoxical effort of cultivating cultural semiotics as “fluxorum scientia”, as science of fluid, iridescent phenomena.

An urge of attribution pervades semiotics. Peirce has imagined the sign as a triadic structure, Saussure as a dyadic one, but no semiotics could rest on a monistic ontology. Every model of sign is permeated by the idea of a cleft, and by the narrative of a quest to bridge it. In Saussure, the sign is unity of signifier and signified, but this unity concerns the phenomenology of signification more than the ontology of meaning. “Sign” could be defined as the name of everything that humans do in order to bridge the perceptible and the imperceptible, the known and the unknown, the uncanny and the familiar. Interpreting signs is tantamount to transforming a chaotic, puzzling reality into language that speaks and is understood. From this point of view,

signification is pervasive, and the scope of semiotics as vast as that of humanity, for living is, for humans, appropriating the unknown. Theories about the genesis of the human semiotic ability often relate it to the needs of hunting, and deciphering the unfamiliar traces left by preys or predators. Increasingly sophisticated languages have been created since the prehistory of humanity, yet it can be argued that the semiotic instinct still is about hunting and being hunted, about turning an unfamiliar environment into a matrix of decipherable elements.

One of the fundamental questions of semiotics, since its inception as semeiotics in the medical field, concerns whether the reading of reality can be guided by technique; whether the terrifying but thrilling experience of turning the unknown into the familiar must be invented at every step through instinct and intuition, or whether, on the opposite, such process of appropriation can be formalized, perfected, taught, and learned. Perfecting interpretation is indeed crucial in all walks of human life, and attribution one of its key processes. Medical diagnosis needs to bridge the gap between some awkward and painful manifestations of the body and the identification of a disease that provokes those symptoms and must be cured to eliminate them. Jurisprudence seeks to attribute a certain human act to a category of behaviors, and relate this to a code or law that rules its existence in society. The reader of a poem or the viewer of a painting must refer the apparently unique arrangement of words and pigments to a genre, a style, a historical and cultural context, and to the poetics of an artist in a certain phase of its evolution. Also everyday life cannot be lead without a modicum of connoisseurship, whose mastery is among the most desirable social skills. Referring fellow human beings to a precise social, cultural, and psychological characterization; ascribing their words and acts to specific categories of intentions; detecting honesty and lie: all these abilities partake in the semiotic hunting that marks the role of humans in both nature and culture.

Being unable of reading the signs of reality, and reality as a sign, means being unable to predict what reality still is not, but might be in the future. That is the case not only for the future of social reality, but also for the future of texts. On the one hand, Wall Street brokers require semiotic ability in order to forecast the course of stock exchange titles. The fact that this ability is not completely formalized as technique does not mean that it stems entirely from mysterious intuition. On the other hand, literary critiques speculating on the interpretation of a novel also debate about the future. In the structural credo, for instance, they argue that the semantic fabric of the novel will elicit a certain range of responses by its potential future readers.

Since antiquity, semiotic theories and techniques have been thought as a remedy to the uncertainty of the future. From this point of view, the place of the semiotic instinct in the evolution of the human species is that of an adaptive quality: those who better relate the current phenomenology of reality to its future developments will be able to react to them in a quicker and more appropriate way. History is replete with anecdotes of humans who failed because, as Americans say, did not see it coming. "See it coming" requires, on the contrary, semiotic skills: see a financial crisis coming, or the end of a relationship, or a new tendency in consumption.

Semiotics as a discipline has therefore faced a double task: on the one side, describing the human consubstantial tendency to decipher the unknown; on the other side, suggesting techniques in order to perfect such innate interpretive drive.

What were the main suggestions of semiotics thus far?

In the frame of Saussure's semiotics, attribution of an unknown signifier to a known signified requires familiarity with the law. It is the law that associates a red flag to a signal of danger, the lexeme "dog" to a zoological species, burning incense with a propitiatory liturgy. The titanic efforts of Saussure's followers, from Hjelmslev's glossematics to Greimas's generative semiotics, have aimed at grasping the essential law beyond every form of signification. Also those signification processes that seemed patterned by unwritten laws or idiosyncrasy, such as social phenomena or artworks, have been investigated in search of a rule of attribution: given an ap-

parently random configuration of plastic elements, or social behaviors, the application of the semiotic method ascribe them to a law, turn them into the token of a type, interpret them. In this framework, what does not mean simply has no meaning, the unfamiliar is doomed to remain such, and ignorance of the signified beyond a signifier is only temporary, destined to vanish as soon as the suitable code will be detected, known, and applied. That explains why the structural mindset never focuses on how laws are instituted, evolve, or decay: what occupies the core of the semiological project stemming from Saussure's definition of sign is the law caught at the peak of its development, the human ability to bridge the unfamiliar and the familiar as it is crystallized in a code, in a system, in the *langue*. That is also why the structural attribution has an exclusively deductive allure: given a rule, a token must be attributed to a type with no exception, and all the cleverness of the semiologist consists in coming up with the most comprehensive formulation of this rule.

That does not mean, though, that the structuralist attribution does not produce any new knowledge. On the contrary, structural semioticians serve the purpose of identifying what explicit code links a token with a type, but also that of eliciting an implicit code from tokens that seem unrelated to any type. On the one hand, the structural semiotician determines that an ostrich egg in a canvas by Piero della Francesca must be related to the meaning of that egg in the coeval heraldic code. On the other hand, the structural semiotician elicits the rule according to which Mondrian's abstract paintings have been created and prompt aesthetic answers.

Lotman's model of cultural interpretation is in line with Saussure's strategy of attribution. Each element in the semiosphere, be it an isolated sign, a text, or a whole language, signifies insofar as it stems from an underlying matrix determining its value in social exchange. Elements in the semiosphere that are not related to any modeling system are chaotic, perturbations coming from outside the semiosphere, or appear as such simply because no semiotician yet has found any suitable way to situate them in relation to the cultural text, in relation with the general pattern of the semiosphere. In Lotman's model too, the aim of the semiotician is twofold: on the one hand, mastering the cultural and sub-cultural codes that explicitly shape communication in society. On the other hand, inductively more than deductively, establishing how different, apparently random signs are indeed a byproduct of some general dynamics of the semiosphere. For instance, the cultural semiotician will be able to differentiate among different kinds of tattoos, and determine which are to be ascribed to the subculture of detainees in a certain country, which are imported from an ethnic, pre-industrial visual culture, and which are a combination of both. At the same time, the cultural semiotician will seek to put forward more encompassing hypotheses about the spreading of tattoos in present-day societies, by claiming, for example, that the fashionable permanence of tattoos, piercing, and scarification is a reaction to the sense of precariousness that anguishes youth in contemporary western countries.

An important question to be raised about Lotman's model and about cultural semiotics in general is the question of creativity and innovation. As it was argued earlier, Saussure's semiology is not primarily concerned with creativity because it is not primarily concerned with time. Semiology provides a structural photograph of the laws that, at a given moment in the evolution of language, underpin the relation between tokens and types. How these laws are created and how they evolve in history concern semiology only retrospectively, for instance when the structural laws of 17-century poetics must be retrieved in order to explain the creation of Shakespeare's sonnets. However, as regards their interpretation, what matters is not to somehow reconstruct the aesthetic reception of Shakespeare's contemporaries, but to understand through which codes *the analyst's contemporaries* read the sonnets. From this point of view, Saussure's semiology is always contemporary. Historical semiotics is possible, but has been rarely chosen as a field of investigation, for the epistemology of semiology is more apt at describing the *langue* of a sign system as static deposit of forms than at speculating on how it might have changed through history.

A giant leap is taken, though, when the structuralist epistemology is applied not to a specific system of signs, like in Saussure, or to a text, like in Greimas's structuralist semantics, but to culture as a whole, considered as system of signs. It is reasonable, indeed, to crystalize the evolution of scripts for the blind – one of the examples given by Saussure in explaining the scope of semiology as he first defined it – into synchronic still frames, since such evolution can be ascribed to a context, for instance, the changing place of sensory impairment in modern societies. The same goes for Greimas's analysis of Bernanos's works in *Structural Semantics*: here too, there was no need to place the French novelist's texts in the flux of time, like historicist criticism would do, for in this case too such evolution would be relegated in the context. In Lotman's semiotics, though, and more generally in cultural semiotics, there is no context. What is the context of a culture, indeed, if not another culture, that is, something that is external and relatively unrelated to it?

As a consequence, in cultural semiotics there is no creativity that is not somehow combinatorial, stemming from the rearrangement of existent types according to different rules rather than from the unfathomable creation of new types. Lotman's semiotics accounts for innovation also through contamination between or among semiospheres. However, like abduction in Peirce, contamination in Lotman is magically referred to more than explained. The issues of how precisely inter-cultural contamination would work, and of how it would generate change in the semiosphere, are left unaccounted for. That ultimately derives from the circumscribed character of the structuralist epistemology. In order to work as an explanatory model, a cultural structure must be closed, its topology determined by precise frontiers. Also Saussure's *langue* is a closed system, as it is closed the system of Greimas's text. However, considering a whole culture as a closed system brings about a vision of society that implies disquieting secondary effects.

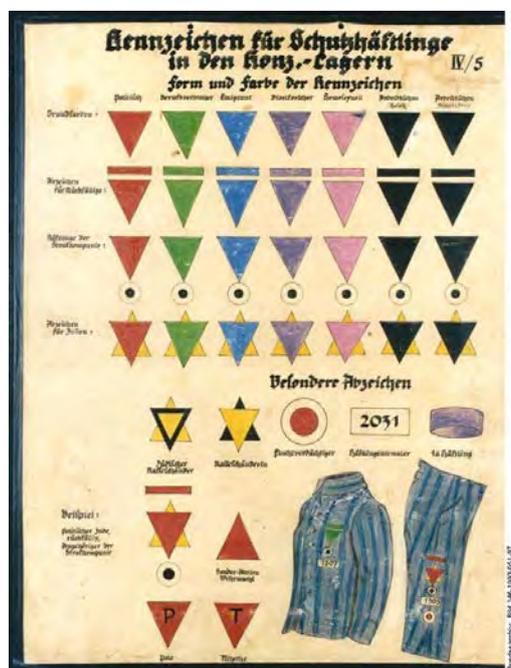

In other words, the urge for attribution that is at the core of Saussure's semiology and Greimas's structural semiotics envisages culture in a questionable way when reproduced at the level of Lotman's cultural semiotics. Cultural semiotics asks at a theoretical level the same question that strangers ask each other when they meet for the first time: where are you from? The social psychology of this question is complicated, but it undoubtedly manifests a drive for attribution, and therefore control. The alien individual is seen as a puzzling novelty, a source of unknown, and therefore as a potential danger. The question "where are you from?" seeks to elicit an answer that will allow interlocutors to 'case' each other, turning individuals into tokens of national and socio-cultural types. Of course there is no need for the question to be uttered explicitly, since it is asked implicitly at every new encounter, and about all the signs that compose a person's social presence. Where is this accent from? Where is this use of words from, and these clothes, and these gestures? Getting to know someone means progressively classifying as tokens of as many types all the signs that compose the person's voluntary or involuntary signification. Stereotypes, both positive and negative, are among the types that individuals use to 'interpret' each other.

As cultural semiotics approaches a text, an object, or a cultural phenomenon whatsoever, it also tends to 'case' it as manifestation of a rule, as expression of a socially deposited *langue*. The stereotypes that cultural semioticians make use of are much more articulated than those which common people, let alone racist people, resort to. Yet, there is something in common between cultural semiotics and racism, as there is between racism and bureaucracy.

Albeit very different in many respects, these three social practices aim at creating an inventory of reality that categorizes and interprets it without residues. Bureaucracy in western universities, for instance, is churning out more and more complicated forms in order to make sure that each aspect in the life of a student or a professor is attributed to the appropriate class, turned into the token of a type. There is nothing that irritates more bureaucracy, indeed, than the unclassifiable case, whose potential novelty cannot be neutralized by reference to a specific form, set of parameters, range of criteria, etc. etc. This classificatory frenzy, which seems to ape that of natural sciences like zoology or botany, covers increasingly large areas of university life. Students' learning,

professors' teaching, the use of infrastructures, financial data, every aspect or behavior cannot be left unaccounted for but must be classified and, possibly, numerically treated. Accounting for university life is more and more tantamount to counting university life. Recounting the meaning of the academia does not require a historian anymore but an accountant.

The desire of controlling other people through turning them into tokens of predetermined types finds the most aggressive expression in racism, especially in the institutional shape it took in 20th-century totalitarian regimes. The parallel between bureaucrats and fascists might seem exaggerated, yet there is something in the epistemology of the former than dangerously resemble the epistemology of the latter. All considered, the common epistemological denominator comes down to substantial anti-humanism. Fascisms, like bureaucracies, do not understand individuals and their behaviors independently from the explanatory grid that was predetermined so as to attribute them to a class of individuals and behaviors. The kind of meta-language that fascisms adopt in order to articulate and interpret people racially is therefore intrinsically bureaucratic, and disquietingly resembles the forms of modern bureaucracy. What follows is, for instance, the visual meta-language through which Nazi concentration camps would articulate prisoners according to their race and the 'crime' they had committed.

Claiming that racism is always bureaucratic does not imply that bureaucracy is always racist. On the contrary, bureaucracy in modern societies is meant to protect individuals from the idiosyncratic abuse of power. Yet, the semiotic parallel between organized racism and bureaucracy should make us wary of collectivities where the impulse to categorize, classify, and interpret individuals attains increasingly pervasive degrees of sophistication. A society that is unable to accommodate exceptions is a dangerous society, perhaps even more dangerous than a society that is unable to come up with rules.

The parallel between organized racism and bureaucracy should warn cultural semioticians too. Medieval scholastic philosophy used to repeat, interpreting Aristotle, "*Scientia est de universalibus, existentia est singularium*", "science concerns the universals, existence refers to singular (objects)" or, with another formula: "*Nulla est fluxorum scientia*", "there is no science of fluxes". In order to produce falsifiable hypotheses about culture, indeed, semiotics must elaborate general models where cultural phenomena are interpreted as manifestation of an underpinning semiotic rule. Cultural phenomena must be stripped of their idiosyncratic particularities

and cased into a category. Cultural semiotics can of course increasingly refine the articulation of its categorical thinking, but its operations keep resting on a theoretical movement of attribution.

Yet, it would probably be reductive to think that cultural semiotics should not be concerned by the existence of singularities, as scholastic epistemology urged sciences to do. On the one hand, the risk that bureaucracy runs when forgetful of the dignity of exceptions, treating them as anomalies, recurs in cultural semiotics too. When cultural semioticians deal with texts, they usually ask them the same question that strangers ask each other when meeting for the first time: “where are you from?” Where are you from, folktale? Where are you from, epic? Where are you from, painting? Where are you from, behavior? What cultural semiotics hopes for as an answer is an indication of where, in the spatial and temporal semiosphere, the object of investigation should be placed and categorized, so revealing its intrinsic meaning in relation to a precise patterning model.

One could argue, though, that asking the question “where are you from” is not the end of the gnoseological process, but the timid beginning of it. Stereotypes and bureaucratic parameters offer a grid to interpret reality, but stopping at them means divesting humanity of its deepest character, means stripping scholarship of its inner beauty. What do we know of a scholar, when we know that he is Italian? Something, but not much. And what do we know of a paper, when we know that it has been quoted twenty times? Something, but not much.

On the opposite, there is a stage in knowledge between two people, at which the question “where are you from?” does not arise anymore. It is the stage of love, or true friendship. At this stage, stereotypes must dissolve and leave space to irony, and the irreplaceable uniqueness of the subject. A subject who, as Lévinas would suggest, is not known anymore as a façade, in its cold splendor, but as visage. Of the architecture of a façade one could argue that follows and embodies a certain style. But saying thus of a visage would bring us back to the dubious investigations of Lombroso, to the Fascist anthropology of the face.

Demanding cultural semiotics to study texts as the visage of a beloved one is perhaps excessively tainted with romantic connotations. Yet, keeping in mind the political danger of turning semiotics into a bureaucracy of cultures is imperative, not only in moral terms – since it reminds us of what humanities are about, and their substantial difference with sciences – but also in theoretical terms. As the forms of university bureaucracy will never be able to tell why a student falls in love with semiotics, or why a professor devotes most of his life to study this discipline, in the same way a cultural semiotics oblivious of its humanistic constraints will be never able to explain how, despite the despotic pressure of the language, the constraining grid of types, and the thwarting cage of modeling systems, signs and their laws are not solid structures but fluid elements, which *do change* through history. A science of fluxes is needed to understand them fully.

SEMIOTICS OF CULTURAL HERITAGES: THE DIALECTICAL PROCESS OF ASSIMILATION AND REJECTION OF OTHERNESS IN THE CULTURAL HERITAGE OF THE AL-ANDALUS CIVILIZATION

Ricardo Nogueira de Castro Monteiro
Universidade Anhembi Morumbi, São Paulo, Brasil
castromonteiro@anhembimorumbi.edu.br

Abstract

The historic transition from the Arabic-Andalusian to the Christian Iberian Peninsula represented much more than a power shift – or even a religious and cultural transition. It represented also a semiotic catastrophe – borrowing here the famous René Thom's conception of catastrophe as a small perturbation leading to the disappearance of a stable macroform and giving place to a new one designed by the subsequent balance of structural forces (Poston & Stewart, 1978). In the above-mentioned case of a semiotic catastrophe, the macroform would be conceived as the semiosphere and its inner relations, and the catastrophe as what Yuri Lotman expressed as an overall change in the cultural structures – in this specific situation, passing from a ternary to a binary system. Lotman presents the ternary cultural structure as the one where explosive processes in certain cultural spheres coexist with gradual changes in others, whereas its binary counterpart would be marked by the perception (or misperception) of a thorough destruction of the previous order followed by an apocalyptic appearance of the new one (Lotman, 2004). The present paper aims to illustrate this catastrophe analyzing two opposing constructions of alterity: the Arabic-Andalusian representation of Christians before the Reconquista in the works of authors such as Ibn Al-Haddad (c.1030-c.1087) and al-Rundi (1204-1285) and the Christian representation of the Moors after it in such works as the masterpiece of the Portuguese poet Luís de Camões (c.1524-1580), *Os lusíadas*. The analyses frontally challenge contemporary mass media stereotypes, displaying a surprisingly modern conception of harmonic coexistence in diversity by the Muslim authors, and an openly biased and manicheist representation of alterity

polarizing Christians against non-Christians in Western writers – with little or no concern at all to the distinctions that separate Muslims from Jews or monotheists from pagan polytheists. A thorough comprehension of this semiotic catastrophe represents a key concept not only to the understanding of Iberian Culture. Its trend to binarism was widely spread both by Spanish and Portuguese Conquistadors, digging deep roots into the soil of the New World. Thus, when Fernando Baez denounces in the title of his famous 2009 book the cultural looting of America (Baez, 2009), the description of the construction of large cathedrals upon the ashes of the once majestic Inca and Aztec temples, pointed by Baez as a token of racist despise for the Native cultures, could be regarded as the mere continuation of a common practice of the Reconquistadors with respect to the formerly imposing Iberian mosques and synagogues. Another interesting phenomenon is the specific way by which Brazil has developed its unique approach to this heritage, combining some ternary aspects that helped it to define its own identity as the friendly “melting pot” defended by authors such as Gilberto Freyre (1933) and Sérgio Buarque de Holanda (1936) in the beginning of the 20th century with the binary elimination, by persecution and/or oblivion, of most of the huge non-Christian legacy that was deeply rooted not only in its Native American and African populations, but also in its Iberian colonizers.

1. Introduction

The historic transition from the Arabic-Andalusian to the Christian Iberian Peninsula represented much more than a power shift – or even a religious and cultural transition. It represented also a semiotic catastrophe – borrowing here the famous René Thom’s conception of catastrophe (Poston & Stewart, 1978). In this case, it would correspond to what Iuri Lotman designated as an overall change in the cultural structures, passing from what he defined as a ternary to a binary system. Lotman presents the ternary cultural structure as the one where explosive processes in certain cultural spheres coexist with gradual changes in other spheres, whereas its binary counterpart would be marked by the perception (or misperception) of a thorough destruction of the previous order followed by an apocalyptical appearance of the new one (Lotman, 2004). The present paper aims to illustrate this catastrophe analyzing two opposing constructions of otherness: the Arabic-Andalusian representation of Christians before the Reconquista in the works of authors such as Ibn Al-Haddad (c.1030–c.1087) and al-Rundi (1204–1285) and the Christian representation of the Moors after it in an excerpt of the masterpiece of Portuguese poet Luís de Camões (c.1524–1580), *Os lusíadas*. The analyses frontally challenge contemporary mass media stereotypes displaying a surprisingly modern conception of harmonic coexistence in diversity by the Muslim authors, and an openly biased and often caricatural Manichaeic representation of otherness polarizing Christians against non-Christians in Modern Era poetry. A thorough comprehension of this semiotic catastrophe is a key concept whose range is not restricted to the understanding of Iberian Culture, for its structural role was emulated in many different cultural scenarios, and its polarization into binarism was also transposed both by Spanish and Portuguese Conquistadors into their imperial possessions in the New World.

2. Ibn Al-Haddad

The careful reading of the works of Ibn Al-Haddad (c.1030–c.1088) – some of them apparently autobiographic – and possibly also some traditional sources convinced Ibn Fadl al-cUmari (1301–1349) that early in his life Al-Haddad would have departed to a peregrination to Mecca, a journey nonetheless bounded to remain incomplete, apparently due to his real or platonic involvement with a Christian nun in a Copt convent in Asyût, Egypt (al-cUmari, 1924:385 and Guerrero, 1978) – a version disregarded by scholars as Yûsuf Alî Tawîl, who favors the hypothesis of the nun being from Almería, where the poet has worked and lived a great part of his life (Al-Haddad, 1990). According to Ibn Bassâm (d.c.1147/1148), the nun’s name, called *Nuwayra* [little light] by the poet, would actually be *Jamila* [the beautiful one], but Al-Haddad would have

changed her name to protect her identity (Foulon & du Mesnil, 2009:246) – neither of the two possibilities offering a particularly likely name for a Spanish Christian nun in those days.

Al-Haddad's lifetime takes place roughly in the period between the fall of the Umayyad Caliphate in 1031 and the first Almoravid invasion in 1086, thus corresponding to the so-called first period of Taifas. Many authors like Emilio Ferrín consider that age “as close to Renaissance as the Tuscany period of city-states” and also “the apogee of Andalusian civilization” (Ferrín, 2009: 403–404). In such an enlightened context, Ibn Al-Haddad provides us an invaluable example of inter-racial relations in the *Convivencia* era – a time characterized by a relatively peaceful and remarkably productive conviviality between Muslims, Jews and Christians in the Medieval Iberian Peninsula.

This scenario marked by a cosmopolitan, diverse and relatively tolerant society can surprise contemporary eyes with its positive and even passionate representation of otherness, as in the case of the poem *كأس عجب لك أسى ع* [Maybe, my beloved, for the grace of your Jesus' truth]. The monorhyme poem with endings in “ki” follows the *wafir* meter, (in the first verse, | u – u u – | u – – – ||). The text is full of gorgeous, meaningful alliterations, as appears already in the first hemistich, *'assaaki bihaqqa 'iissaaki*, a *paronomasia* relating the fascination the nun exerts upon him (*'assaaki*) to her condition as a Christian (*'iissaaki*), in a semantic approximation reinforced by the assonance and isorhythmic accent the two expressions share. It is important to emphasize that such resources are not punctual – on the contrary, they are structural as far as many genders of Andalusian poetry are concerned, and their permanence in Spanish and Portuguese written and oral literatures is unfortunately widely overlooked. Nevertheless, we will focus momentarily on the categories of content rather than of expression, leaving further considerations regarding figures of expression to our subsequent discussions about the next two examples.

Thus, let us consider the following translation of the above-mentioned poem directly from its original in Arabic (Al-Haddad, 1990):

١- عَسَاكَ بِحَقِّ عَيْشِكَ مُرِيخَةً قَلْبِي الشَّكِي
 ٢- فَإِنَّ الْخُسْنَ قَدْ وَلَا كَ إِحْسَابِي وَإِهْلَاكِي
 ٣- وَأَزْلَمَنِي بِمُسْتَبَانَ وَزُهَيْدِي وَنُشَاكِي
 ٤- وَلَمْ آتِ الْكَسَائِدَ عَزَّ فَوَقَّ فَيَهْنُ لَوْلَاكَ
 ٥- وَهَذَا أَنَا بِشُكِّ فِي بَلْوَى وَلَا فَزَجَّ لِيَبْلُوكِي
 ٦- وَلَا أَتَطَيَّبُ لَوْلَانَا فَغَدَّ أَزْنَقَتِ أَفْرَاكِي
 ٧- فَكَمْ أَكْبَى عَلَيْكَ نَمًا وَلَا تَرْتِيئِينَ لِلشَّكِي!
 ٨- فَهَلْ تَنْزِيئِينَ مَا تَقْضِي عَلَى عَيْشِي عَيْشِيكَ؟
 ٩- وَمَا يُذَكِّيهِ مَنْ نَارِ بِغَلْبِي نُوُوكِ الدَّكَاكِي؟
 ١٠- خَتَيْتِ نَسَاكَ عَنِ بَصْرِي وَفَوَقَّ النَّسْءِ بِشُكِّكَ
 ١١- وَفِي الْعَفْنِ الرُّطْبِ وَفِي الدَّ تَفَا الْمُرْتَجِّ عَيْشِيكَ
 ١٢- وَعِنْدَ السُّرُوسِ خَدَاكَ وَمِنْ رُؤْيُ رُؤْيَاكَ
 ١٣- نُؤَيَّرُ، إِنْ قَلَبْتَ فَاذْ عَيْشِي أَفْرَاكَ أَهْرَاكَ
 ١٤- وَعَيْشِيكَ الْمُتَبَيَّنَا كَ أَنِّي بِحَقِّ قَتْلَاكَ

- 1) Maybe, my beloved,
For the grace of your Jesus' truth,
You may want to ease this pain in my heart!
- 2) Beauty has given you the gift of bringing me life or death,
- 3) And it has made me passionately worship the crosses of the ascetics;
- 4) Never had I gone to the churches for the sake of these crosses, were it not for you!
- 5) Here I am, because of you, submitting myself to such an ordeal,
With no joyful solution to the torments that you inflict on me.
- 6) I cannot relieve myself falling into oblivion,
For your remembrance retains me into the webs of your love.
- 7) How many tears I have cried,
But you had no mercy for this sufferer!
- 8) Do you know what have your eyes decreed against mine?
- 9) Do you know how the subtle light that emanates from your face
Sets fire into my heart?
- 10) You have hidden your light from my eyes,
While it shines above the sun itself.
- 11) I see the forms of your back in the sandy dunes, in the branches of the trees,
- 12) I see your knees in the contours of an infant's bed,
I feel your scent amongst the perfumes of the flowers.
- 13) Nuwayra, no matter how much you refuse me, I love you, I love you
Bear your eyes witness
- 14) That I shall be counted among the number of your victims.

Fig. 1: Al-Haddad's original poem and translation.

In the discursive level, there is the opposition between the condition of the poet as an *infidel Muslim* and his beloved one as a *faithful Christian*. The *grace* of her *presence* is the only possible healing for the *pain* of her *absence*, and seeing her an inevitable condition, since not doing so in the denotative meaning implies to be condemned to do so in the connotative meaning by *daydreaming of her*. He presents himself as a victim of his *beloved* one – a *light* that sets him on *fire*, a *shine* whose absence throws him into an anguishing *darkness*. It is useless to try to forget her, for he obsessively remembers her, her beauty imposing itself on him and anything else with the force of a divine *decree* that subdues him, while he desperately *appeals* for her mercy to be loved in return. In his *passion*, he experiences simultaneously the *life* that emanates from her and the *death* that her absence means to him. Thereby, the organization of themes, figures and the shifts of time, space and actors result in the following table:

<i>Discursive Level</i>			
	THEMES	faithful Christian	infidel Muslim
		grace	pain
		seeing you	daydreaming of you
		presence	absence
	FIGURES	shine	darkness
		beloved	victim
		appeal	decree
		light	fire
		remembrance	oblivion
		your face	my tears
	COMPLEXITY	worshipping	
		seeing you	
		(denotatiion)	(connotation)
	ACTANTIAL	you	not-you (dunes, trees, flowers etc)
		Nuwayra	I
	ANTITHESES	oblivion	remembrance
		shine	darkness
		life	death
		passion	
	SPATIAL	church	here
	TEMPORAL	maybe	present

Table 1: Analysis of the discursive level of Al-Haddad's poem.

In the narrative level, the main opposition is between the *realization* of the subject when in conjunction with the object of his love and his *virtualization* when he is in disjunction with her. Thus, her *empathic light* appears related to states of soul such as *love*, *grace* and *mercy*, whereas the abject *fire* that burns him in her *antipathetic* absence is marked by *rejection*, *pain* and his *obsession* for her, thereby allowing the following schematization:

<i>Narrative Level</i>			
	DESCRIPTIVE V.	light	fire
	MODAL V.	realization	virtualization
	PATHEMIC V.	love	rejection
		grace	pain
		mercy	obsession
	PATHEMIC P.	empathy	antipathy

Table 2: Analysis of the narrative level of Al-Haddad's poem.

Finally, as far as the fundamental level is concerned, it is important to note that the classical opposition between *life* and *death* is transcended by what appears in the text as a complex term:

passion. Simultaneously a token of life and death, of euphoria and dysphoria, an attraction to which he in vain tries to resist in order to remain a pious Muslim, the intensity and acceleration that takes the poet towards the infinite extensivity of atemporality, in his passion he finds both the poison and the cure of his divided soul. The organization of that level can be summarized by the following table:

<i>Fundamental Level</i>		Complex Term: PASSION	
CATEGORIES	LIFE	DEATH	
PHORY	euphoric	dysphoric	
VALENCE	attraction	repulsion	
TENSIVITY	extension	intension	
CELERITY	retardation	acceleration	

Table 3: Analysis of the fundamental level of Al-Haddad’s poem.

Simple as it may seem, the usage of *passion* as a complex term between *life* and *death* should by no means be overlooked. After all, the fact that the fundamental category of *life* is convoked in the discursive level to an isotopy of figures and themes related to the imagery of Christendom whereas its counterpart *death* will correspond to the imagery of Islam implies that *passion* transcends such a dichotomy, suggesting a semiosphere whose diversity is stable enough to deal with such dualisms without falling into the kind of polarization that is characteristic of Lotman’s binary systems. Hence, the poem seems to express the values of a ternary system where otherness can be presented as a positive value – a feature to be expected in mature and tolerant societies as, in relative terms, the First Taifas era is displayed in most of its contemporaries’ eyes.

An interesting approach to analyze this phenomenon can be found in Eero Tarasti’s Existential Semiotics. According to Tarasti’s model (Tarasti, 2012), the poet’s corporality (*Moi 1*), here aroused by his passion for the Christian nun, will become a key ingredient to the restructuring of his sense of identity (*Moi 2*) – in the present case, triggering a crisis in his self-perception as a Muslim. That crisis puts him in conflict with his previous conceptions of standard social norms (*Soi 1*), pushing him to redefine them in new abstract rules (*Soi 2*) whose *revolutionary* character becomes particularly evident, for the *transcendence* associated in the text with the poet’s love suggests a social and cultural order where religious barriers have significantly decreased in importance.

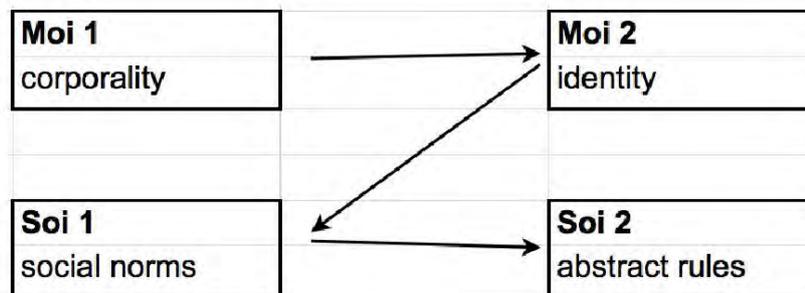

Fig. 2: Existential semiotics approach to Al-Haddad’s poem

Thus, the disruptive character of the poet's passion for the nun can be read as an *explosion* in Lotmanian terms, taking place here in what the Russian semiotician defined as a ternary structure, for it appears in the semiosphere as a gradual transition to change rather than a radical opening of a horizon of possibilities. In Lotman's words: "explosion in this case is not characterized by a general catastrophe, for in its inner structure there is a constructive force that cleans the *Augias' stalls* and opens a path towards a new phase" (apud Gherlone, 2014:65). According to Laura Gherlone, "Lotman calls this dynamics a 'revolution,' differentiating it from what takes place in binary structures, defined as 'turbid' – a situation where transformation is experienced as something confuse, turbulent, irrational" (idem). The gradual transition of the Iberian semiosphere from a ternary to a binary system will be further discussed in the analyses of the following examples.

3. Al-Rundi

In their famous article "Abu 'l-Baqa al-Rundi and his elegy on Muslim Spain", Ebied and Young attribute to Miguel Casiri the alleged dates for Al-Rundi birth and death (Ebied & Young, 1976:29). Indeed, Casiri, in his classical *Bibliotheca arabico-hispana escurialensis* published in 1770, states that a poet from Ronda who was the author of *De Temporum Cognitione* and *De Haereditate* would have been born in 1204 and died in 1285 (Casiri, 1969:379). Nonetheless, no matter how defensible it would be to identify *De Temporum Cognitione* with a metric treatise attributed to Al-Rundi, the main problem is that Casiri is referring to an author whose name appears in the original in Latin as Ben Shariph Alzabdi – and if the supposition that Ben Shariph and Ibn Sharif can be a same person is more than acceptable, the fact that Alzabdi has no resemblance to anyone of the names associated to Al-Rundi is at least problematic, not to say rather compromising as far as the verisimilitude of that hypothesis is concerned. Anyway, Al-Rundi is the author of a magnificent poem: a lament enumerating the sequential fall of a series of Andalusian cities to the Christian kings in a *nuniyya* – a classical form of monorhyme poetry with verses ending in *nu*, culturally perceived in the Arabic semiosphere as an onomatopoeia of crying. The author organizes the melancholic parade of defeated cities in chronologic order with Cordoba as the only exception, for in spite of being the first to fall, it is the penultimate city in the poem – a poetic license justifiable by its status as the former capital of the Caliphate and the importance of its fall to the twilight of the Muslim civilization in the Iberian Peninsula.

Besides an analysis of the plane of content, it is important here to consider once more the structural role of alliterations and their homologations to categories of content as a vital stylistic resource to provide effects of meaning and to enrich the poetic text with varied rhetoric figures. If this procedure was already observed in the first line of the previous example, its systematic usage in Al-Rundi's *رِثَاةُ أَلْأَنْدَلُسِ* – *Rithâ'u Al-Ândalus*, or *Lament for Spain* – calls our attention to its outstanding significance in the Andalusian poetry of its time and also to the everlasting influence it would exert in the Iberian literature, far outliving the tragically effective attempts that took place especially between the late 15th and early 17th centuries in order to erase the cultural legacy associated to the Muslim and Jewish heritage that had flourished in the peninsula during the Middle Ages.

Let us consider the first verse of the original poem (El Gharbi, 2009) and also the brilliant translation provided by James T. Monroe – a reference that we will follow in our comments to all the subsequent verses (Monroe, 1974 pp. 332–334):

(1) لِكُلِّ شَيْءٍ إِذَا مَا تَمَّ نَقْصَانُ فَلَا يُغْرُ بِطَيْبِ الْغَيْشِ إِنْسَانُ
 Everything declines after reaching perfection
 Therefore let no man be beguiled by the sweetness of a pleasant life.

Fig. 3: Al-Rundi's poem, verse 1.

The poem is written in the meter *basî*, most of the text having each hemistich following the rhythmical pattern:

| u - u - | u u - | - - u - | uu - ||

Both the first and the second hemistichs of the first verse end up sharing words in the same metrical position that present a sequence of phonemes consisting, in this order, of a palatal consonant [n], a sibilants [s/S] and a long vocal [a]. Were such an effect limited to an isolated case of assonance, it would be nothing more than a figure of expression that would enrich the sonority of the text. Nonetheless, there are two very important points to be considered. The first one is that such effects appear so frequently not only in this poem in particular but also in Medieval Andalusian poetry in general that it might be considered as a stylistic coercion valid for a whole set of genres of that period. Not less important, the second point is that the assonances here, constructing homologies with categories of content, establish semi-symbolic relations that, pervading both the planes of expression and content, enrich the poetic text not only in terms of plastic beauty but also in signification. Thus, the sound association between the trisyllabic words 'nuqSânu', with its sense of loss and decay, and 'insânu', the human being, produces a semantic contagion of the first term 'decay' to the second, 'humanity', by means of their shared sonority. Thereby, besides the enunciate itself, the rhythmicity in the plane of expression and its homologation with the semantic trace of 'decay' will also reinforce the idea of the fragility of the human existence in this world.

An even more eloquent example of semantic contributions of figures of expression to the process of generation of meaning in the syncretic text appear in the 2nd hemistich of verse 2:

(2) هِيَ الْأُمُورُ كَمَا شَاهَدْتَهَا نَوَالٍ مَنْ سَرَّهُ زَمَنْ سَاءَتْهُ أَرْمَانُ
 As you have observed, these are the decrees that are inconstant:
 He whom a single moment has made happy, has been harmed by many other moments;

Fig. 4: Al-Rundi's poem, verse 2.

The most exquisite poetic resources here are a consequence of the metrical structure of the verse. The terms *نَمَزَ* [zamanun] and *نَامَزَا* [âzmânu], derived from a same root and related in form and meaning, are both located in the ending of a pair of feet: zamanun – the moment of joy – follows a |u u –| rhythm, whereas the time of suffering, âzmânu, is composed of only long syllables: – | – –||. The consequent effects of meaning are a progressive *gradation* from a brief state of joy to a long period of suffering, a *pleonasm* and an *hyperbole* that emphasize the dysphoric character of the comparison lending more weight and duration to the sad rather than the happy moments of life. This effect is also reinforced by the phonetic and rhythmic parallelism between *sârahu zamanûn* and *sâcathu âzmânu*, where once more the second pair of words begins with two long syllables whereas the first has a long and a short one.

An example of alliteration appears on verse 5:

(5) وَيَنْتَضِي كُلُّ سَيْفٍ لِلْفَنَاءِ وَلَوْ كَانَ ابْنُ ذِي يَزَانَ وَالْعِمْدُ غُمْدَانُ
 It unsheaths each sword only to destroy it
 Even if it be an Ibn Dhi Yazan and the scabbard Ghumdan

Fig. 5: Al-Rundi's poem, verse 5.

In the first hemistich, *فِي سَائِفِ* [saifi alfanâci] – “the sword to destruction” –, in which the letter “f” is associated to the semantic trace of cutting, presents a *metonym* and/or *onomatopoeia* representing the sound of the blade quickly moving in the air. Besides, “Saif” is here a *double entendre* homonymic *paronomasia*, for it designates also to the first name of Ibn Dhi Yazan, the pre-islamic king of Yemen who became legendary for his power, wealth, faith and bravery and who is quoted in the second hemistich, thus allowing also an interpretation such as “it (fate) disarms all the Saifs (as emblematic heroes) leading them to destruction”. In the following hemistich, some of the main rhetorical tools corresponding to figures of expression exposed so far are reutilized, confirming their structural role in the poem. Thus, *وَأَنْزَلَ أَوْ نَادَمُغ* [wa al-ghimda ghumdânu] has in “ghimda ghumdânu” a *paronomasia* where the three first written letters are identical; a metrical progression from “ghimda” (– u) to “ghumdânu” (–| – –) indicates a dysphoric prolongation analogous to the one described in verse 2, consolidating it as a semi-symbolic relation in the text. The word “ghimd”, that means “scabbard”, is therefore related by form and meaning to Ghumdan, which is the name of the famous and gorgeous palace from where Ibn Yazan ruled Yemen. So, in each hemistich of the 5th verse, a *double entendre* relation worked as an isotopic connector between a connotation alluding to the imagery of Ibn Yazan's saga – as an example of the prevalence of fate and the ephemerality of glory –, and a denotation associated with the weapons men stubbornly and hopelessly use to fight for their purposes.

The alliteration of fricatives with the connotation of destruction pervades the poem, as in the aspirated “هـ” and “ح” (roughly corresponding to laryngeal and palatal aspirated fricatives) in verse 3:

(3) وَهَذِهِ الدَّارُ لَا تُبْقِي عَلَى أَحَدٍ وَلَا يَدُومُ عَلَى خَالٍ لَهَا شَانُ
 And this is the abode that will show pity for no man,
 Nor will any condition remain in its state for it.

Fig. 6: Al-Rundi's poem, verse 3.

Another important resource in the poem, parallelism (in Al-Rundi's text, particularly the anaphora) marks in that verse the syntagmatic and phonetic constructions *lâ tubqî alâ âhadîn* and *lâ yadûmu alâ Hâlin*, reinforcing the hopelessness of human condition – a semantic trace that will be extended in the *Ubi sunt?* sequence in verses 6 to 9, and that possesses in the Arabic term “Ain” [Where] that starts each one of its sentences the suggestive sonority of a lamentation.

As an exhaustive and detailed analysis of the figures of expression and semi-symbolic relations in the 42 verses of Al-Rundi's poem lies beyond the objectives of the present article, let us advance now to a more general discussion about the generative path in his *Lament for Spain*:

Plane of Content				
<i>Fundamental Level</i>				
CATEGORIES	CULTURE (Islam)	NATURE (Fate)

Table 4: Al-Rundi's poem: generative path.

The thematic opposition between an implacable divine *fate* and the illusions of *power* men have nurtured throughout history convoke to the discursive level the main fundamental dichotomy *nature x culture*. The isotopies related to the *careless* and self-confident *Muslim* who believed to have mastered the world to *perfection* give place to the *fatalist* observer that can do nothing but witness the victory of the *infidels* over a *decaying* Islamic empire. Thus, the figures of a *happy, easy* and *pleasant* life ruled with wisdom by people like the king *Solomon* are replaced by a *harmful* existence full of *hardness* and *pain*, where the tragic fall of once powerful and ambitious tyrants like *Dario, Chosroes* or *Shaddad* are copiously enumerated. Bells ring where once there were *mirhabs*; *crosses* are raised over the ruins of the old *minibars*; *kings* are converted to *slaves*, and instead of their *jewels*, they are now covered with the *clothes of shame*. A temporal shifting out establishes the contraposition of a glorious past to a miserable present, whereas its spatial counterpart opposes mosques to churches, and the homes of the faithful to the wasted land of the infidel and the actantial shifting out establishes *brethren* of *kings* whose members are addressed as “*You, beyond the see*” as the enunciatees of a discourse that depicts enuncively the *people of Al-Andalus* converted into *slaves* under the severe judging eye of an unappealable fate. The narrative level is marked by a complex program of *provocation* in which the addressee is confronted with the humiliation and defeat of Iberian Islam and challenged in his apathy to remain indifferent to violence and injustice or to take arms in succour to his brethren against the

barbarism of the invading infidels. So, the addresser performs a manipulation by provocation imposing a modal configuration of *to-make-to-want-to* on an initially aboulic – *not-to-want-to* –, proud and hedonistic addressee. The manipulation, managing as a provocation the negative values of the system, converts the thymic category of dysphoria and the repulsion valence, as the positive values associated to pleasure, pride and power correspond to the conversion of the category of euphoria and the attraction valence. Less evident and more complex are the tensive and celerity configurations that organize the fundamental level, by which the extensiveness of the sempiternal and irrevocable decrees of fate belong to the *Nature* semantic axis whereas the vertiginous acceleration of the fall of Islamic Iberia and the intensiveness of its joy and suffering follow the *Culture* axis.

Finally, the main *femes* that organize the categories of expression in their homologies with the categories of content will equally correspond to the oppositions that organize the fundamental level. Hence, *extensiveness* and *dysphoria* will often appear associated with the metric *prolongations* previously described in this item, and the alliterations can be organized opposing the extensiveness of the *fricatives* associated with connotations of *destruction* and *decay* with the *intensiveness* of the *occlusives* that reinforce the imagery of power and pride. Finally, a far more sophisticated resource appears ruling the frequent usage of the *paronomasias* in the poem, opposing their *denotative* attributes related to the imagery of *culture* and human pride to their *connotative* qualities associated to a fatalist point of view deeply rooted in the Islamic conception of the philosophical *nature* of the universe. The Andalusian philosopher and polymath Averroes (1126–1198) – a giant who left an indelible mark in the history of philosophy and whose legacy, rejected in most of the Islamic world in the first centuries after his death, is essentially inseparable from the ascension of rationalism in Western civilization – writes in his *On the harmony of religions and philosophy* that a metaphorical approach to the interpretation of the scriptures and the creation (by means of science and reflection) is a privilege of those whose destiny is a further comprehension of reality, whereas a more literal interpretation is proper to those deprived of deeper intellectual ambitions (Averroes, 2012). Hence, Averroes states that those able to this *connotative* approach would be closer to the *nature* of *truth* – a point of view popular enough in the Al-Andalus civilization of Al-Rundi's time to contaminate his poem and organize in a systemic way his rich and abundant usage of *paronomasias* in his *Lament for Spain*.

4. Final considerations

The gradual change in the cultural representations of otherness from the idyllic and passionate admiration for the Christian nun in Al-Haddad's poem to the somewhat distant and impersonal antagonism with respect to the figure of the infidel depicted in Al-Rundi's *Lament for Spain* – more the cold executor of Allah's will than an enemy to be hated – continues its evolution throughout the centuries until reaching in the early 16th century to the kind of polarization described by Lotman in his definition of a binary system. The *Reconquista* led not only to the territorial conquest of the Iberian Peninsula by the Spanish and Portuguese Christian kingdoms: between 1492 and 1614, virtually all the Jews and Muslims of the Peninsula were forced either to conversion or to exile and tenths of thousands of books written in Arabic and/or Hebrew were burned (Amelang, 2011) in a general effort to annihilate any traces of what had for almost eight hundred years been the most advanced civilization in Europe and the Western hemisphere (Vernet, 2006). Unsurprisingly, the cultural representations of otherness in both the Iberian and the Muslim world would be deeply affected by this fierce antagonism, as can be seen in this excerpt of Portuguese writer Luiz de Camões's *opus magnus*, the gorgeous poem *Os Lusíadas* [The Lusitanians]:

<i>A - Ao Mouro, ser molesto e avorrecido,</i>	<i>The Moor, that evil and sad creature,</i>
<i>B - No pensamento cuida um falso engano,</i>	<i>Had in mind a treachery</i>
<i>A - Com que seja de todo destruído;</i>	<i>That with its lies intended to ruin everything;</i>
<i>C - E, enquanto isto só na alma imaginava,</i>	<i>And while those thoughts were in his soul,</i>
<i>C - Consigo estas palavras praticava:</i>	<i>He somehow practiced them already with his words:</i>
<i>D - «Está do Fado já determinado</i>	<i>“Fate has already determined</i>
<i>E - Que tamanhas vitórias, tão famosas,</i>	<i>That the Portuguese reach fame</i>
<i>D - Hajam os Portugueses alcançado</i>	<i>and tremendous victories</i>
<i>E - Das Indianas gentes belicosas;</i>	<i>Against the brave Indian warriors;</i>
<i>D - E eu só, filho do Padre sublimado,</i>	<i>And meanwhile, I, the son of a sublime Father,</i>
<i>E - Com tantas qualidades generosas,</i>	<i>With my so many qualities,</i>
<i>F - Hei-de sofrer que o Fado favoreça</i>	<i>Will I suffer that Fate favours</i>
<i>F - Outrem, por quem meu nome se escureça?</i>	<i>Somebody else and thus see my name die in the shades of oblivion?</i>

(Camões, 2014:14)

Fig. 7: Excerpt of the first chant of Camões's Os lusíadas.

A detailed analysis of the poem similar to the previous discussions in this article reveals a series of alliterations that, as in the former examples, establish important homologies with the opposing semantic axes that pervade the text from the fundamental to the discursive level – and, as seen before, respond also at least partially to the organization of the figures of expression. An analysis of the generative path and symbolic relations in the text is summarized in the following table:

Plane of Content			
<i>Fundamental Level</i>			
	CATEGORIES	NATURE	CULTURE
		non-euphoric	non-dysphoric
	VALENCE	attraction	repulsion
	TENSIVITY	extension	intension
	CELERITY	retardation	acceleration
<i>Narrative Level</i>			
	DESCRIPTIVE V.	fame	oblivion
	MODAL V.	virtualization	realization
	PATHEMIC V.	[glorious]	sad
		brave	evil
		victories	treachery
		favours	suffer
	PATHEMIC P.	empathy	antipathy
<i>Discursive Level</i>			
	THEMES	victories	treachery
		fame	oblivion
		Fate [glory]	ruin
		presence	absence
	FIGURES	Portuguese	Moor
		[truth]	lies
		[Christian God]	Sublime Father
		[light]	shades
	ACTANTIAL	somebody else	I, the son
		Portuguese	Moor
		Brave Indian Warriors	
Plane of Expression			
SEMI-SYMBOLISM			
	ALLITERATIONS	dental consonants	labial consonants
		/d/; /t/;	/m/; /v/
	CONNOTATION	aggressiveness	perfidy
	ALLITERATIONS	open vocals	closed vocals
		/á/;	/o/; /e/;
	CONNOTATION	victories - authority	treachery
	ALLITERATIONS	bilabial occlusive consonant	sibilant consonants
		/p/	/s/
	CONNOTATION	victories - explosion, revelation	treachery

Table 5: Camões's poem: generative path.

Here, the demonization of the moor, presented as an abject character that subsumes the negative values of the system, will paradoxically mobilize most of the poetic resources we have examined so far. The structural utilization of rhyme – unknown in Western tradition until its popularization in Muslim Spain as part of the Arabian cultural heritage since the 8th century –, an accentual configuration close and stable enough to allow an approximation with a metric structure like |u – |u – |u – |u u u | – – || (3 imbs, 1 tribrach and 1 spondee) pervading the whole poem and the systematic usage of semantized alliterations reveal that this Portuguese text, no matter its explicit islamophobia, paradoxically – and rather schizophrenically – honors the heritage of the many centuries in which the Arabian language and its literary genders dictated the patterns of poetical excellence in the Peninsula. The sibilant consonants and closed vowels, like a serpent hidden in the shadows, represent the perfidious Moor in opposition to the explosive consonants and open vowels that depict the openness, bravery and frankness – by the way, a virtue culturally associated in the West to the Germanic Franks, champions of Christendom – of the Portuguese heroes. Brazilian cultivated and popular literary genders – the last still widely practiced today – would emulate for centuries both the polarization and the formal procedures of the poem above. With a massive presence of New-Christians (descendants of former Jewish and Muslim families) among its first colonizers and too far from the metropolis to be reached by the persecutory arms of Inquisition, Brazil, as other nations of the New World, has preserved some traces of the Al-Andalus legacy in its national ethos and cultural forms of expression. The receptivity to ethnic and cultural diversity and the immediate assimilation of foreigners in a mixed society that was defined by scholars like Gilberto Freyre and Sérgio Buarque de Hollanda as a friendly “melting pot” would according to these authors be part of the Al-Andalus heritage inherited by the Brazilian civilization (Freyre, 1971, 1992; Buarque, 1995) – as the binary elimination, by persecution and/or oblivion, of most of the huge non-Christian legacy that was deeply rooted not only in its Native American and African populations but also in its Iberian colonizers would reflect the proud 16th century obscurantism that would in a few centuries take Portugal and Spain from the position of the most powerful transoceanic empires of their time to the condition of peripheral actors in the geopolitical scene.

Abstract

“Digital nomads” (DN) is a metaphor, which used to be nothing but a neologism some time ago (Makimoto, Manners, 1997). But it presented the essence of the phenomenon so fairly that over the next few years became very popular in journalism. Moreover, it turned into the commonly used scientific term in the interdisciplinary discourse among social philosophers, social scientists, media theoreticians, economists, and architects.

Digital nomads are people who, in the processes of their professional activities (or studying, creating art, free time), are not confined to particular spots through using Internet technologies and mobile connection. Therefore, the phenomenon of DN belongs solely to the network information-communication society. It appeared in the context of two inter-dependent global trends: mobility and digitalization.

The number of DN increases. At first they were the inhabitants of “wireless” megapolises. Today, due to the development of satellite communication, they can be seen in countryside, cold and regular deserts, etcetera. In order to become a digital nomad, it is not necessary to be a dedicated traveler or to move from one place to another in a common, physical sense. The major point is to be always “plugged” to the Net through some sorts of gadgets. This “plugging” is the key factor which determines a digital nomad.

The culture of DN is constantly evolving and turning into the “universal” culture of the network society. In some sense, it covers various traditional cultures and subcultures and absorbs

them (assimilates). In this regard, people are starting facing different issues. The one that should really draw our attention is that the practical aspects of digital nomadism anticipate developing its theoretical grounds. Studying “digital nomadism” today is, in most cases, fixating and describing specific life situations (cases) and discussing them in blogs.

There are many questions that have not been answered yet. For instance:

- What is the ontology (form of existence and world view) of digital nomadism, which determines its culture and social practices?
- What are the anthropological changes people must go through in order to become true DN?
- What are the specific characters of digital nomadism culture as of combination of sign systems, characterized by certain processes, codes, and media?
- What determines identity and limits of this culture?
- What artifacts and “mentifacts” (Posner, 2004) constitute it?
- What are the relations between network society, civilization, and DN’ mentality on one hand and sign systems on the other?

The authors of the given paper try to find answers to these questions base their arguments on specifically developed methodological complex. It is based on the ideas from postmodern philosophy (G. Deleuze and F. Guattari) (“rhizome”, “nomadism”); theory of information network society (M. Castels); theory of “extended sensory organs” (M. McLuhan); cultural and semiotic approach (E. Cassirer, J. Lotman, R. Posner); theory of mobility (J. Urri); concept of “digital nomadism” (T. Makimoto, D. Manners) and some others. Beyond that, the authors are applying the method of “parallel metaphorization”. It is basically a search for names of artifacts and “mentifacts” in the socio-cultural system of traditional nomads which can be used as metaphors for determining corresponding artifacts and “mentifacts” in the culture of digital nomads.

1. Introduction

In the 1970s of the last century the term “nomad” (from Latin – “nomas” – shepherd) became a key one in *nomadology*, which is a metaphoric post-modernist concept of “new tribalism” by G. Deleuze and F. Guattari (1986). The concept was the result of their philosophical reflection on the eternal opposition between state power and individual freedom. Searching for something that could stand up to such power Deleuze and Guattari came up with the idea of nomads. Nomads appeared to be the power, which had been capable of destroying the strongest empires.

Aspects of new nomadism represented by J. Attali (1991) were not as much philosophical as they were social and political, economic, and partly anthropological. He argued that the beginning of new millennium was marked by establishing a *digital-nomad* form of hyper-industrial society. Attali represents the concept of “nomad goods” – affordable, compact, and functional devices and gadgets irreplaceable for super-mobile members of global techno-centrist society.

T. Makimoto’s and D. Manners’s “anarchic” book (1997) renewed interest in the nomad theme in late 1990s. The authors pointed out that digital nomads are people who, in the process of their professional activities (or studying, art, free time), are not confined to particular spots due to access to the Internet and mobile communication. “Digital Nomads” as a metaphor became popular. Moreover, it became a scientific term for interdisciplinary discourse among sociologists (Urri 2000), social psychologists (Rosseel 2000), linguists (Baron 2001), economists, media theoreticians, and architects (Kakihara and Sorensen 2001, Mitchell 2004).

IT-corporations promoted and romanticized the image of digital nomads. In reality, digital nomads are often perceived as freaks and geeks. But nowadays, thanks to the development of satellite communications, one can meet them in villages, deserts, and rain forests. Therefore, the

phenomenon of digital nomadism belongs solely to *the network information-communication society* (Castells 1996). Nevertheless, digital nomadism, as the idea and the new socio-cultural practice, was still comparatively infrequent object of scientific discourses and critics. The major problem is the following: cultural practice of digital nomads goes far ahead of establishing its philosophical and theoretical foundations that would allow predicting the consequences of its evolution and globalization for the humanity.

Many issues, concerning this new cultural practice, require permanent professional philosophical and scientific attention. First of all, we mean the questions of *ontological, anthropological, and semiotic character*. For instance: the ontology of digital nomadism; anthropological changes, which accompany its development; specifics of digital nomadic culture as of combination of sign systems; something that determines identity and limits of this culture; artifacts and “mentifacts” (Posner 2004), which constitute it. Our objective is to find general answers to these questions, applying specifically selected methodology.

2. Methodology

Methodology of our research is based on specifically selected philosophical and scientific concepts and theories. They fulfill each other and allow shaping the most ultimate conception of the object in question – the culture of digital nomads. Apart from the very concepts of “digital nomadism” proposed by T. Makimoto and D. Manners (1997), J. Meyrowitz (2003), W.J. Mitchell (2004) and of “digital goods” proposed by J. Attali (1991), the grounds of this complex consist of: post-modern philosophy and theory of post-structuralism (G. Deleuze and F. Guattari 1987, M. Foucault 2001); concept of “symbolic capital” (J. Baudrillard 1981); theory of “extended senses” by means of media (M. McLuhan 1994); theory of information network society by M. Castells (1996); concept of hierarchic network society (A. Bard and J. Soderqvist 2002); theory of “virtual reality” and “virtual class” (M. Heim 1997, U. Eco 1986); theories of mobility (J. Urri 2000) and “liquid modernity” (Z. Bauman 2000); anthropological approach (B. Anderson 1991); social and psychological approach (E. Rosseel 2000); cultural and semiotic approach (E. Cassirer 2002, J. Lotman 2002, R. Posner 2004); concepts of “digitalization” and “digital culture” (C. Gere 2002, S. Dixon 2007); and several other theories and concepts.

3. Ontological aspect

Digital nomadism is entirely the phenomenon of the modern network information-communication society. Therefore, we will consider the ontology of this society. There are at least two positions to define its specifics.

3.1. Utopian position

The very name of the network information-communication society represents its basic characteristics and trends: networking nature, informatization, domination of communication processes over all other processes, globalization, technologization, digitalization, and computerization. All those trends are interdependent. However, many philosophers and scientists believe that general technologization is the original cause of all other factors and consequences (D. Bell 1973, Z. Brzeziński 1970, J. K. Galbraith 2007, M. McLuhan 1994, M. Castells 1996, J. Naisbitt 1982, etc.).

The first opinions on this new society were formulated long before it was actually founded. Futurologists-technocrats did not deny it would face different problems. However, they believed that humanity would be able to solve them with the help from new digital and computer technologies. “Bright future” was supposed to be based on the economy of new type (“based on knowledge”, “informational”, “super-symbolical”, “service”), end of beurocracy, and victory of

democracy. Futurologists-optimists and technocrats formulated the following key metaphors for the ontology of the environment and the place of life/work: *global village* (McLuhan 1964); *global metropolis* (Kahn and Bruse-Briggs 1972); *global city* (Sassen 2001); *electronic cottage* (Toffler 1980). Being very different, those approaches still have some things in common. They describe the most traditional – for most people – places of life and work. Places that do not conflict with the human existential nature. Such optimistic view on the information future of the humanity was dominant in social philosophy, social studies, and futurology during the last third of the XX century.

3.2. Anti-utopian position

The forthcoming global society was described differently by futurologists-”anti-utopianists”; existentialists; Frankfurt School theorists; post-structuralists and post-modernists; some present-day sociologists, economists, and researchers in the field of social communication and new media (A. Huxley 2005, G. Orwell 2003, K. Jaspers 1953, H. Marcuse 1991, J. Baudrillard 1981, M. Foucault 2001, Z. Bauman 2000, P. Virilio 2010, S. Garfinkel 2000, J. Attali 1991, A. Bard and J. Soderqvist 2002, W.J. Mitchell 2004, etc.). The artistic, philosophical, and scientific concepts they represented were different. But they all had one thing in common: the lack of any “rosy expectations” in the “portraits” of the post-industrial stage of human development. They understood the ambivalent nature of technologies, which are capable of spinning out of human control and managing people, both straightly and secretly. They were under no illusion about transparency and non-hierarchical nature of the network society.

Most of the authors mentioned above realized the dominant types of capital in the network society. Those are information, symbolic, and reputation types of capital, not knowledge one, as it had been stated before. Computer technologies are capable of finding, organizing, and keeping data. They are not capable of producing knowledge. Knowledge is a product of human consciousness. Therefore, the society becomes “information”, not “knowledge-based” one. The ontology of the forthcoming society is defined here as *information-communicative, self-organizing, based on the principles of chaos and order*; and as an *organized simulacrum space*. “Space hybridity” describes the lack of distinct line between virtuality and reality and is one of the most important characteristics of the network society. It is determined by the terms *virtual reality, real virtuality, and augmented reality*. Its structure is characterized as *hierarchic networking, risomatic, neural, fractal, matrix, and fluid*. Anti-utopianists observe the effect of time and space compression and actualize the parameters of speed and mobility. The latter implies not only physical moving of people the real world, but also their “moving” in the virtual space (Urri 2000).

This society has a super-complex character because of its ontology and structure. It also faces various unresolved problems such as the lack of any distinctive line between real and virtual, information wars, hacking, total digital control and manipulation of collective and individual consciousness; digital terrorism; universal access to pornography; “digital inequality”, and some other. All that led to certain metaphoric definitions for this kind of society: super-complex/super-mobile society, society of risk, society of total control, virtual society, viral society, society of digital natives and digital immigrants, NETocracy.

The key metaphors of the ontology of space and place of residence/work in the “anti-utopian” paradigm of the network society are: *virtual space, hyper-space, augmented reality, maze, net, matrix, social nets, information highways, digital hubs, digital copies of cities, global digital agora*. These spaces, highways, and hubs are inhabited or used by digital nomads.

4. Anthropological aspect

There are utopian and anti-utopian views on the ontology of the network information-communication society. This society is a context for digital nomadism phenomenon. These views have shaped certain ideas about anthropological changes and trends that may take or are already taking place.

4.1 Anthropological changes under the utopian paradigm

Neither of the approaches under this paradigm was antagonistically related to existential and social essence of an individual, threatened the integrity of his personality, destroyed his identity, or deprived him of the freedom. Moreover, the biggest-ever “sense organs extension” (McLuhan 1994) and qualitative brain improvement with the help of electronic computing machines (Tofler 2002) were expected. New reason for being optimistic was brought by “digital nomads” at the end of 1990s and the beginning of 2000s. The former term was proposed by T. Makimoto and D. Manners (1997). Wireless communication and “constant plugging” created “continuous fields of presence” and helped digital nomads to do business, to study, to play the market, to participate in auctions, to order goods, and to do other things with no regard to any particular place of residence (Mitchell 2004).

In 2008, “The Economist” published a series of papers on digital nomadism (A wireless world...: 2008 n.p.; A wireless world...: 2008 n.p.). The whole spectrum of its positive characteristics was proposed to the audience. Digital nomad is a free person, at least, from an office table. He chooses what he does as well as where he does it. Being an owner of some business, he does not need to waste money on the office rental. He and his employees have meetings with partners and clients at, so called, “third places” (Oldenburg 1989). This work style increases labor effectiveness and improves democratization. Digital nomad spends more time with his family. He outsources services when it comes to something that troubles or burdens him, including his own memory. Now he does not have to *memorize* anything, because he has special devices, such as memory sticks and hard-drives, for that.

Digital nomad can travel, work, or study, permanently exploring the world around. Technologies are so good – they are mobile, multifunctional, and portable – that one does not need to carry a lot of things. It is enough to have a laptop or a smartphone and to know where the nearest “sanctuaries” – cafes, gas stations, and sockets – are. Those are places where one can recharge, literally and figuratively. Geolocation services can help with that too. Chains of special – “nomadic” – industry offer their services and products to digital nomads. The main thing is – digital nomad is free to choose partners for communication. As a result – he becomes more relaxed, active, and creative. However, there is an opposite view on digital nomadism as an “ideal” cultural practice that leads to certain anthropological changes.

4.2. Anthropological changes under the anti-utopian paradigm

Total technologization of the society led to the following contradictions and problems of anthropological nature: existential crisis; compartmentalization and distortion of identity; simulacration of consciousness; substitution of real communication for virtual one; computer addiction; unpredictable brain changes under the influence of electronic and digital technologies; lack of ability to control information flows, and so on.

J. Attali presented one of the most anti-utopian scenarios on the anthropological changes related to the digital nomadism. He argued that a nomad has particular mission, which is to contribute to the universal heritage via self-liberation. He is committed to turning his life into a piece of art instead of to boring reproducing other self-like humans. This process of “turning life into a piece of art” may be so creative that sooner or later might lead to “nomadic madness” and

“industrial cannibalism”. In Attali’s opinion, anthropological aspect of digital nomadism goes beyond the limits of the humane sense (Attali 1991).

A. Bard and J. Soderqvist draw the picture of the modern society as of the society of digital nomads, almost “from life”: virtual return to the nomadic times, which we owe to the digital networks, is very peculiar, as the idea of a permanent home does not represent some kind of “standing point” any more, which stimulates further experiments with different life styles (Bard and Soderqvist 2002). According to D. Rushkoff, only *present* matters to the people of the digital age. All their demands must be satisfied *here and now*. There is so much information in the digital world that they simply do not have enough time to turn it into knowledge. Rushkoff points out a “narrative collapse”: the new online content does not require the art of narration from a person. Rushkoff finds very sharp metaphors to reveal the essence of the amazing anthropological phenomena of the network society. For instance, he calls a digital mailbox a “big infinite loop” that causes “digiphrenia” (digital schizophrenia) (Rushkoff 2013: 76).

Total freedom from time and space routine and opportunity of self-employment are advantages of digital nomadism. However, there is an opposite side to that too. In fact, everyone, who works for himself, has a tyrannical boss. In other words, digital nomads are permanently anxious and stressed because their labor productivity is not high enough comparing to the opportunities they have. Digital nomads often act as addicts or gamblers when they cannot get rid of their need to be connected. Special surveys show that most nomads are slaves to their habits. They take the same routes and follow the same schedules every day (Gonzales, Hidalgo and Barabasi 2008: 71).

E. Rosseel also conducted a survey. But his results showed that it is quasi-impossible to predict digital nomad’s future taking into account his present. This unpredictability concerns, at least, four aspects of the nomad’s life: 1) place of his residence; 2) professional activity; 3) marital status; and 4) his personalization and subjectivization. From the socio-psychological point of view, “nomad” means mobility in literally everything. He can easily change his attitudes, place of residence, identity; he can master new social practices and professional skills (Rosseel 2001). Thus, digital nomadism as an anthropological phenomenon raises many questions and requires further research.

5. Semiotic aspect

Cultural and semiotic approach proposed by E. Cassirer (2002), J. Lotman (2002), and R. Posner (2004) considers: i) the culture of digital nomads as a semiosphere or a set of sign systems used by digital nomads to develop and maintain their identity and relations with the world around in the network information-communication society; ii) digital nomads as a community of sign users and their civilization (artifacts and technologies) as a set of texts; and iii) digital nomads’ mental culture and mentality (ideas, values) as a set of conventional codes.

5.1. Specifics, identity, and limits of the culture of digital nomads

This question may be reformulated to the question about codes and media that are involved into sign processes initiated and interpreted by digital nomads inside their sign systems. By codes we mean “a set of signifiers, a set of signifieds, and a set of rules which determine the relation of these to each other” (Posner 2004: 59) or “systems of correlation between signifiers and signifieds” (Posner 2004: 70). In this regard, key codes of sign systems, constituting the culture of digital nomads, are semantic connections between the key metaphorical terms (signifiers) and corresponding traditions, artifacts, technologies, social institutions and spaces, rituals, etc. (signifieds). Those semantic connections must be encoded and decoded identically by all bearers of the culture of digital nomads. Such pairs of signifiers and signifieds, among others, are:

“nomadism” = real and virtual mobility; “nomadic items” = mobile devices; “desert” = the Internet; “oases” = “third places” (cafes, public libraries, Wi-Fi zones, etc.); “fires” = “virtual fires” (forums and meetings in “third places”). Originally the codes of digital nomadism were artificial (conventional) but gradually have become natural (behavioral). All these codes are connected with intellectual culture (mentality) of the global community of digital nomads. It may illustrate the following statement: “Any mentality is to be understood as a set of codes” (Posner 2004: 70).

The term “medium” which is used “to designate a constellation of factors which remains the same over a wide range of sign processes” (Posner 2004: 60). *Technological* media (computers, mobile connection devices, various electronic devices and gadgets) play a special role in organizing sign processes in the culture of digital nomads. Sometimes they are hardly distinguishable from *physical* media. Conventionally speaking, we may assign the term “physical medium” to radio waves, which are some sort of an “asset” in the network society. Major *functional* media, characterizing sign processes in accordance with objectives and formats of messages, are “blogs”, “posts”, “chats”, and “forums”. The examples of *codified* media are digital nomads’ personal or corporate blogs, their local (regional) or global Internet forums. Being *biological* media themselves, digital nomads have very well developed visual, audial, and tactile receptors. Basic social media are real social spaces (cafes and libraries provided with Wi-Fi connection, co-working zones, stores specialized in selling “nomadic” items) as well as virtual social spaces (social networks such as Facebook, Twitter, LinkedIn). The network society has a dual ontology – virtual reality and real virtuality. Computers and smartphones are the interfaces of two parallel worlds where they connect. Semiotic processes are at the same time the processes of socialization – or social communication – in those two worlds. Social media has a specific function. They organize all other types of media that are involved in producing signs (Posner 2004: 62). The Internet appears to be a “super-medium”. It is a semiosis – semiotic continuum, which is filled with multi-variant semiotic structures situated at a range of hierarchical levels (Lotman 2002). It is a super-system, which possesses a constellation of features that influence semiotic processes.

Mobility (real and/or virtual) and “constant plugging” to the Net constitute the core of the identity of digital nomads. Those are two basic characteristics. They form the very “subject matter” of digital nomadism and, at the same time, are the technological bases for producing all sign processes. They help identify representatives of the culture. Mobility and connectivity make the culture of digital nomads super-mobile and global. It expands both horizontally (inside the same social strata) and vertically (among strata). From the point of cultural semiotics, globalization of the culture of digital nomads is a progressing semiotization of reality segments by virtue of marking them with metaphorical signifiers that are key for the given culture.

5.2. Artifacts and “mentifacts” which constitute the culture of digital nomads

Artifacts are known to constitute the basis of material culture of the society or of its civilization. Mentifacts, along with conventions, constitute its mental culture and mentality (Posner 2004: 70). The dual ontology of the network society means duality of the onto-status of digital nomads’ civilization. It is not solely represented in reality by, for instance, various electronic devices, gadgets, and other “nomadic” items. It also exists virtually, that is in the forms of electronic (digital) artifacts – video and audio files, electronic documents, computer graphics, etc. Over a long period of time digital artifacts have been predominant over material and analog ones. That is why such term as “Digital Age” may be used to determine the modern epoch as an analogy to the terms “Iron Age” and “Bronze Age”. Mentifacts of the culture of digital nomads are ideas and values they follow in their every-day super-mobile lives. By “ideas” R. Posner means “all categories with which a society interprets itself and its reality” (Posner 2004: 70). From this point of view, they include not only digital nomads’ idea of independence from stationary workplaces,

but also such categories as “mobile home”, “oases”, “virtual fires”, and others. The same metaphorical terms represent digital nomads’ cultural codes. This illustrates the following R. Posner’s statement: “Any mentality is to be understood as a set of codes” (Posner 2004: 70).

In Lotman’s broad concept of text, “every artifact with a function and a coded message can be regarded as a text” (Posner 2004: 72). The most important artifacts that provide digital nomads with their identity are mobile devices: cell phones, laptops, USB flash drives, charging devices, modulators. From this perspective, we witness self-genesis of texts in the culture of digital nomads: texts produce other texts. Therefore the question of the culture’s identity coincides with the question of the limits of its texts with its non-texts. Those limits are determined by the following opposites: “mobile – stationary”, “connected – unconnected”, “online – offline”, “wired – wireless”, “electronic – analogue”, “multifunctional – monofunctional”, “compact – massive”, “high-speed – low-speed”, “freelanced – office”. The first term of each pair is a category that determines characteristics of artifact texts. The second term of each pair determines non-text characteristic.

However, digital nomads’ artifacts and mentifacts, among other special features, are easily incorporated by other civilizations and mental cultures, including the most ancient and viable ones. For example, Muslims use the Qibla application in their cellphones, which helps to find the direction that should be faced when praying during *salat*. Catholics use an application that sends messages from the Pope. In these cases, the artifacts belong to different very strong and viable cultures and complement each other. When it comes to less viable cultures, such as youth or corporate ones, the culture of digital nomads causes anthropological changes of “tectonic” character that we mentioned in the previous part of the paper.

Therefore, the methods of cultural semiotics may be applied for analyzing the culture of digital nomads despite its specific nature. No doubt, this part of the paper does not claim to be exhaustive on semiotic-related issues of the culture of digital nomads. It represents our first attempts to reflect on the problem.

6. Conclusion

Interdisciplinary approach to studying the problem of the culture of digital nomads from the positions of ontology, anthropology, and semiotics is the most relevant because it allows studying it more profoundly. It also helps to anticipate the consequences of its further development and globalization.

LA NEGATIVITE COMME FONCTION CULTURELLE DANS LE DISCOURS LITTERAIRE

Somayeh Kariminejad Estahbanati
Université Tarbiat Modares, Téhéran, Iran
somaye.kariminejad@yahoo.com

Résumé

La négation est un élément sine qua non au sein du langage. Depuis longtemps cette notion était le sujet de différentes disciplines comme la philosophie, la logique et la linguistique. Mais nous voyons quand même qu'elle pourrait donner lieu à une analyse sémiotique et il nous semble que quelques-uns de ses aspects n'ont pas encore été dûment explorés. Les approches et les typologies de la négation sont nombreuses. Cette pluralité s'explique par la complexité et la diversité des négations. Notre visée, sans être exhaustive, consiste surtout à envisager, à travers le discours littéraire persan, pris comme exemple, le problème de la modulation du négatif. Notre tâche consistera plutôt à montrer comment la négativité fonctionne dans des discours littéraire persan. Nous chercherons surtout à comprendre de quelle manière la culture persane élabore la négativité ? Faut-il considérer cette dernière comme une source de tensions et de limites ou une possibilité du dépassement de soi et des choses.

Du point de vue sémiotique la négativité n'est pas un fait absolu étant donné qu'elle dépend entre autres de la culture dans laquelle elle prend existence. Afin d'éclaircir ce point de vue, nous nous concentrerons sur la littérature persane où nous avons affaire à des sujets qui existent physiquement, mais qui perdent le pouvoir de parler. Dans ce cas le sujet serait frappé du sentiment d'être nié, et il commence à vivre une sensation dysphorique qui provoque un certain nombre de manifestations passionnelles chez lui. Nous sommes ainsi en présence d'une négativité interne chez le sujet. En quoi cette manifestation varie selon l'espace du vécu propre à la culture persane?

Du fait que la négativité est réversible et s'avère relative aux discours et à ses usagers, cet essai se donne comme objectif l'examen culturel des modes de fonctionnement sémiotique de la négativité dans le discours littéraire persan.

1. Introduction

La négativité en tant qu'un élément essentiel des langues participe à la construction de la signification dans la mesure où elle peut, soit créer des discontinuités et exiger la disjonction entre le sujet et l'objet de valeur soit nier un actant ou un terme. De ce point de vue, on peut supposer que la négativité fonctionne comme un moteur de sens chez le sujet. Ainsi ce travail aura pour objectif de montrer l'émergence de la négativité chez le protagoniste d'un roman persan contemporain de Parivash Sanii, sous l'effet de la culture iranienne. Selon Lotman "toute culture vivante possède un mécanisme intégré" (1999: 10) ainsi nous cherchons à préciser de quelle manière la culture persane avec une structure spatio-temporelle spécifique élabore la négativité ? En effet, dans cet essai notre objectif est l'examen culturel des modes de fonctionnement sémiotique de la négativité dans le discours littéraire persan.

Le corpus choisi est le récit *Ma portion* qui fait sous forme de biographie d'une adolescente originaire de Qom, la chronologie des évolutions historiques et sociales durant les quinze années précédant la révolution ainsi que les vingt années qui la suivent, et cela en y attachant une attention toute particulière. Il décrit tous les méandres culturels et historiques d'une famille religieuse fanatique à travers les événements pré et postrévolutionnaires en exposant leur opportunisme, calculs, tactiques et les bénéfices et les pertes subies par les personnages nombreux de l'histoire et il met la portion suspendue en l'air d'une femme qui cherche à parcourir son itinéraire en dehors de ces corridors obscurs comme un point d'interrogation immense devant les yeux du lecteur. La question : « Qui suis-je ? »

2. La définition des termes clés : La négativité et la culture

On commence par une présentation brève des termes de la négativité et de la culture qui sont considérés comme les termes clés de notre travail.

Nous vivons tous dans un monde où nous sommes sans cesse confrontés au jeu entre la négativité et son pôle opposé c'est-à-dire la positivité. On peut prendre en compte cette notion de différents points de vue. Par exemple "le sens narratif (la négation narrativisée dans le manque et dans le conflit), le sens passionnel (celui du rejet, de la répulsion, du dégoût ou de l'aversion...), le sens cognitif (qui s'exprime dans l'ignorance, le « nul n'est censé ignorer la loi »), le sens météorologique (le trou, la lacune, le vide, l'absence)." Bertrand (2010 :1) Ainsi, en parlant de la négativité il précise que "ce terme s'étend comme une isotopie sous-jacente à l'univers des discours." (2010 : 2) Il importe de souligner un point essentiel de ces définitions ; la négativité n'est pas nécessairement manifeste et visible. Du point de vue philosophique : action de nier l'existence de quelque chose dans l'intention, explicite ou non, d'affirmer la possibilité d'un monde meilleur.

Quant à la culture, si on l'envisage comme médiation sémiotique entre l'homme et la réalité est mise en avant par E. Benveniste et A. J. Greimas. Le premier appelle culture "le milieu humain", à savoir tout ce qui, au-delà des fonctions biologiques, "donne à la vie et à l'activité humaine forme, sens et contenu". Pour lui, la culture, en tant que fait humain, est un phénomène "entièrement symbolique" dans la mesure où elle est un "ensemble très complexe de représentations" qui se manifestent sous forme de "traditions, religions, lois, politique, éthique, arts", et c'est par la langue que l'homme, en tant qu'être social, "assimile la culture, la perpétue ou la transforme". Benveniste (1966 :30) La nature sémiotique de la culture est de même soulignée dans la définition que Greimas en propose. Pour lui, en effet, la culture, est "la société érigée en signification." (1984 :121). De ce fait, elle est la somme de "toutes les pratiques sociales signifiantes", à savoir "la totalité des discours que la société tient sur elle-même".

3. Le sujet ignoré par son contexte familial

Selon Lotman “ la culture se comprend comme un système sémiotique ayant une fonction médiatrice entre l’homme et le monde extérieur. La culture sélectionne et structure l’information venant du monde extérieure ; la sélectionne et la structuration varient évidemment selon les cultures. ” Au sujet du système de valeurs constitutif de la société iranienne dans les décennies 40, 50 et 60 telle que l’écrivain décrit dans l’ensemble du livre, on peut dire qu’il s’articule, comme une période où la relation entre des jeunes filles et des garçons avait un aspect négatif. Il ne s’agit de rien d’autre qu’une force sociale face à laquelle l’individu ne peut rien et qui n’est autre que la religion.

Il n’est donc pas étonnant de constater que seul le mariage permet à une fille d’être en contact avec un homme. C’est-à-dire elle doit constituer la famille, ce qui est légitime dans la société mais il ne faut pas oublier que ce n’est pas la fille qui décide pour choisir son mari et la plupart du temps c’était le père ou les frères qui décidaient et la fille n’a pas même le droit de parler aux hommes avant le mariage dans la mesure où la fille qui est aimé d’un garçon fait un malheur et une déconsidération pour sa famille. Le sujet de la négativité serait de ce point de vue un sujet dynamique et en mouvement. Mais la question essentielle porte sur le fait de savoir en quoi ce dynamisme va aboutir à la construction d’une forme de vie chez les femmes qui vivent dans telle société. Comme nous le savons, le mot négativité surgit dans la relation où un terme détruit au profit de l’autre pour que celui-ci puisse dominer dans la relation.

Dans l’histoire choisie à étudier, on constate que les éléments qui viennent de la sphère culturelle retrouvent le maximum degré de tonicité et ainsi de suite l’intensité de la présence du sujet s’affaiblit dans la relation. On est confronté à un sujet qui est ignoré par les obligations et les contraintes définies par la société. La plupart du temps le corps physique du sujet nous fait conscience de sa présence physique mais en général on ne voit pas d’actions - comme décider, parler de son destin-qui montrent la présence réelle ou autrement dit existence d’une personne dans un ancrage spatio-temporelle. Ainsi le sujet qui est une femme vit dans un lieu où les masculins peuvent décider à sa place et son avis n’a aucune importance. Elle n’est pas autorisée de donner son avis. Toutes ces privations chez une fille proviennent de la moralisation précise de cette société où elle vivait. La moralisation définit une attitude dictée par des exigences éthique propres à une communauté. Ainsi respecter les décisions acquises de la part de sa famille (c’est-à-dire son père et ses frères) pour elle, est un atout de séduction ; et, en cela, il ne fait que marquer son adhésion à une certaine image d’une personne valorisée au sein de la communauté dont elle fait partie.

Au début de l’histoire, la famille de Masoumeh décide de déménager à Téhéran mais selon un de ses frères Téhéran n’est pas un lieu convenable pour les filles, à ce moment-là, Masoumeh donne son avis mais d’autre frère Ahmad qui aime beaucoup vivre à Téhéran arrête Masoumeh et lui dit “ tais-toi, si le problème de la famille est l’existence de Masoumeh, elle se mariera et restera à Ghom ” (2013 :15)

Ainsi on est confronté à un sujet angoissé à partir des comportements des membres de sa famille. Elle a peur de tomber dans la relation de disjonction avec son objet de valeur c’est-à-dire aller au lycée et étudier. Quant aux modalités ; on est en face d’un sujet modalisé par vouloir, un sujet désirant. Elle s’efforce de présenter son vouloir-être à toute la famille quand les autres sont en train de nier sa présence. La charge modale du vouloir crée une tension qui ne s’épuise qu’avec la conjonction à l’objet de valeur. Ainsi, le parcours existentiel de Masoumeh sera constitué d’une suite de transformations jonctives (conjonction, disjonction) qui participent de la construction de son identité. Quand sa famille décide que Masoumeh doit se marier avant son déménagement, il en va tout autrement pour un sujet comme Masoumeh qui est dominée par la peur. Vu qu’elle ne peut pas atteindre à ses vœux alors son être est modalisé par un vouloir

négatif. On peut certes considérer que, face à un anti-objet qui la menace, elle aspire à une non-conjonction. « Je me rendais tous les jours au sanctuaire de Sainte Masoumeh et je la conjurais qu'ils m'amènent avec eux et qu'ils m'autorisent à fréquenter une école. Je disais en pleurant : Si j'étais un garçon ou bien si j'atteignais la diphtérie comme Zari et je mourais. » (2013 :16) Le sujet se sent fréquemment cette émotion dans différentes étapes de sa vie.

Quand toute la famille était d'accord que Masoumeh se marie avec le boucher du quartier qui était ami de son frère-Ahmad- c'est la voisine, Parvine, qui arrête l'action avant la conjonction du sujet avec l'anti-objet. Parvine qui avait un passé semblable au sujet aimerait faire quelque chose pour Masoumeh.

Masoumeh a souvent une inquiétude générale, celle-ci constitue une sorte de prémisse à la grande émotion, celle qui marque la perte de l'objet par le sujet. Le sentiment dysphorique de la peur fait du corps du sujet un centre de tensions incontrôlable. Ce sentiment naît de ce que Masoumeh ne comprend pas. Il résulte de l'impossibilité d'intégrer dans le champ des savoirs et des croyances de Masoumeh un phénomène particulier et étrange par ex : ne pas aller au lycée, ne pas parler à son amie téhéranaise

En effet cette émotion éloigne le sentiment de présence, une présence sensibilisée qui permet au sujet de se voir elle-même. Donc le sujet, malgré son désir intérieur, va vers la négativité qui provient des croyances et des exigences de sa famille ou bien de la société où il vivait. D'une autre manière le sujet n'est pas un individu isolé et idéalisé, mais un être qui agit dans la société et est conditionné par la société et la culture. En fait le sujet produit la signification par ses comportements.

Le mariage avec un autre garçon sauf Saeid qui lui plaisait gardait Masoumeh dans la négativité et enfin quand elle est obligée de se marier avec Hamid c'était comme la conjonction entre le sujet et l'objet répulsif ou dysphorique. En effet Masoumeh n'avait aucun rôle dans le choix de son époux. Même dans la cérémonie quand elle résistait devant ce mariage forcé quelqu'un d'autre a dit « oui » à sa place. La famille de Masoumeh dans le procès du mariage de Masoumeh ferme totalement les yeux et ignore l'existence totale de la jeune fille. Alors on constate la négativité absolue du protagoniste même lors de son mariage qui est un événement particulier et très important pour les filles.

4. L'effondrement du sujet

Il y a des moments où le sujet se trouve dans une étape de convulsion de l'âme et de la perte momentanée de la raison. Les effets somatiques de cette émotion saisissent facilement par l'observateur. Le sujet face à ce qui l'épouvante, demeure paralysé, sans pouvoir se mouvoir. Masoumeh se trouve dessaisi de toute compétence. On peut voir effectivement, cette paralysie qui affecte Masoumeh lors de la crise émotionnelle c'est-à-dire le moment où la relation de Masoumeh avec un garçon révèle devant sa famille.

“ On dirait qu'on m'avait versé un seau d'eau froide sur la tête, j'ai eu l'impression que tout d'un coup la totalité d'eau existant dans mon corps s'est séchée et j'ai eu la langue bloquée. ” (2013 :66).

En effet dans cette étape Masoumeh a honte surtout devant son père. Cette honte constitue un des principaux effets de la moralisation. Elle est liée à la crainte d'une dégradation de sa propre image et présuppose une certaine idée de soi. Dès que la peur s'empare de nous, nous nous traitons de lâches. Le mot peur est chargé de tant de honte que nous la cachons.

La plupart du temps Masoumeh éprouve un sentiment de honte relatif à la peur qui les envahit, à l'émotion qui bouleverse tout son être et toute sa vie, toute son identité. C'est là l'effet d'une moralisation négative de la passion de la peur. Définie par le petit Robert comme un “ sentiment pénible d'infériorité, d'indignité devant sa propre conscience ou d'humiliation devant autrui, d'abaissement dans l'opinion des autres ” (1880 :2008). La honte, sur un plan réfléchi implique

une évaluation négative du comportement que l'on a eu ou que l'on est tenté d'avoir.

Pour Paul Valéry, la honte trouve sa source dans “ l'émotion produite en quelqu'un par le sentiment d'autrui, d'une collectivité, d'une opinion publique ” (1974 :355)

En effet la honte met en scène le jugement dépréciatif des autres ; elle est liée à l'idée de dégradation de l'image du sujet dans l'opinion d'autrui. En fait, l'opinion est un croire qui modalise la représentation qu'on se fait de la valeur et des mérites du sujet ; en l'occurrence, la honte est liée à ce changement qui intervient dans le croire des autres et, plus précisément, dans l'objet du croire : la valeur du sujet, suite à un comportement jugé moralement condamnable, est totalement ou partiellement niée par l'instance morale.

Ainsi, cette émotion dépossède le sujet – Masoumeh – de son pouvoir et même de son vouloir et en ce moment un jeu conflictuel se déroule au cœur de Masoumeh en tant qu'un membre de la société où elle vivait. Elle se trouve entre deux tendances contraires ; d'une part la tendance de lutte pour arriver à son amour et ses vœux qui était contre les coutumes et les croyances de sa famille d'autre part la tendance de l'acceptation de la réalité de sa famille et de la condition d'être nié car elle est une fille et soumission à ses frères. Chacune de ces deux tendances cherche à l'emporter sur l'autre mais le sujet n'était pas tellement apte de dévaloriser ce qui était comme une valeur dans sa société alors une autre fois elle a accepté la négativité de son existence. Et elle subit un état dysphorique pour satisfaire ceux qui sont autour d'elle.

La source de tous ces malheurs viennent à une axiologie propre à une époque précise et à une aire culturelle donnée, ces figures- en elles-mêmes neutres- sont jugées soit négativement soit positivement. C'est ainsi que la liberté d'expression, tomber amoureuse de quelqu'un et l'étude pour les filles sont considérés négatives d'après les traditions et la religion de cette époque-là.

5. Le sujet fondu dans la négativité

La négativité est comme un gouffre qui avale le sujet dans les différents moments de sa vie mais quand même on constate de temps en temps un courage de la part de Masoumeh pour se libérer de la situation dans laquelle elle était emprisonnée. On définit le courage comme la volonté, qualités qui sont constitutives de la force morale. C'est précisément ce « qui fait supporter ou braver le péril, la souffrance, les rêves » Littré ; c'est en somme, ce qui rend le sujet apte à faire face à l'objet dysphorique qui est en l'occurrence défini comme redoutable.

Cette force d'âme est ce qui rend compétent puisqu'elle est dépassement voire ignorance de la peur. En somme, le courage est une peur surmonté et le courageux est ainsi celui qui agit malgré la peur qu'il connaît pour le remettre dans l'ignorance et toutes les difficultés qu'il connaît sur son chemin.

- Je pensais à une issue pour gagner plus d'argent pour pouvoir satisfaire les besoins futurs de mes enfants. Evidemment ma situation s'améliorerait après avoir obtenu une licence. Comme j'attendais à cela, tous les membres de ma famille croyaient à l'unanimité des voix que j'aurais dû renoncer à faire des études universitaires pourtant ce qui me semblait bizarre c'était que la famille de Hamid était de même avis. Le père de Hamid m'a adressé la parole avec de la compassion.
- Tu es sous pression, tu ne penses pas que ce soit difficile de faire les deux en même temps ?... j'ai fait beaucoup d'efforts pour me contrôler, mais ces jours-ci je n'étais plus aussi patiente et forte qu'avant et je n'étais pas non plus la jeune fille maladroite venant d'une province qui se soumette aux demandes injustes ou aux sarcasmes des autres, je n'étais plus quelqu'un qui ne prenne pas en considération ses désirs et sa propre volonté. Une colère s'est éveillée en moi, elle a effacé toutes mes incertitudes et a fait disparaître la terreur dont j'avais été saisie. (2013 :269)

Donc quand le sujet parvient à faire triompher la tension qui le pousse vers l'affrontement sur

celle qui lui commande de reculer est un courageux qui s'approche de l'état de la positivité. On pourrait ajouter que par le courage, le sujet se constitue en héros d'elle-même.

Quand –même d'après les événements qui arrivent à Masoumeh jusqu'à la fin de l'histoire on constate que la négativité n'est pas éprouvée comme un état provisoire, elle constitue une composante de l'identité du sujet. On dirait qu'elle est pleinement intégrée à son être et jugée comme telle. En effet si nous nous interrogeons sur l'identité qui fait état d'une femme en tant qu'instance énonçant, nous constatons qu'elle se ramène à une caractéristique fondamentale qui se voit beaucoup chez les auteurs qui dessinent les femmes de la société iranienne de cette époque-là. Ces caractéristiques sont le dépassement en soi et la fidélité. Celles-ci sont une sorte de « savoir-faire » inné chez la femme et qui se nourrit de l'ordre social.

Dans cette étape on pourrait montrer les différentes étapes de la vie du sujet.

Étape 1 : soumission le temps où elle fait tout le temps le dépassement de soi, quand elle était une jeune fille dans une famille religieuse et fanatique.

Étape 2 : le mariage avec un homme politique qui avait un esprit plus ouvert que sa famille. Elle a osé de se présenter et penser à ses vœux.

Étape 3 : quand son mari qui était un militant est emprisonné et est condamné à mort elle a compris qu'elle doit changer sa manière de vie pour gagner la vie de ses enfants et soi-même.

Mais quand même à la fin de l'histoire quand elle avait un certain âge et ses enfants étaient grands et chacun avait sa famille. Masoumeh rencontre son vieil amant à l'âge mûr et qu'il lui demande la main même si elle s'intéresse beaucoup à mener le reste de sa vie en compagnie de quelqu'un dont elle était amoureuse pourtant elle pense encore une fois à ses enfants et elle dit à Saïd : " Bien que mes enfants soient mariés et qu'ils aient leur propre vie mais étant donné qu'ils sont très sensibles au sujet de tout ce qui me concerne et je n'aime pas qu'ils soient mécontents, je dois donc les consulter avant de me décider. " (2013 :505) Cependant quand elle leur en parle, ils s'y opposent fermement sans prendre en considération l'avis de leur mère et ses besoins émotionnels. Masoumeh qui est gravement dérangée par le comportement de ses enfants refuse la proposition de mariage de Saïd. Et au moment où elle se confie à son amie intime Parvaneh :

Ma grand-mère disait toujours : La part de chacun de nous de la vie est déjà déterminée, on l'a mise de côté pour chacun d'entre nous et rien ne peut la changer ou modifier. je pense souvent quelle était ma propre portion dans la vie ? Est-ce que j'avais une portion déterminée et indépendante ? Ou bien je faisais partie de portion des hommes de ma vie qui m'ont en quelque sorte conduit au lieu de sacrifice pour atteindre à leurs idéaux ou objectifs ... On dirait que je n'existais jamais, je n'avais aucun droit, quand j'ai pu vivre pour moi-même ? Quand j'ai eu le droit de choisir et de décider ? Quand ils m'ont demandé ce que je désirais ?... Comme on dit : Personne ne me veut pour ma propre existence. Tout le monde me cherche pour sa propre existence » (2013 :524, 525)

Le regard évaluateur et jugeant ou bien le regard d'autrui force le sujet de continuer à vivre dans la négativité. Autrement dit, son attitude doit absolument paraître conforme aux valeurs de la communauté à laquelle il appartient car ce que le sujet met en jeu, c'est son identité sociale. Ainsi le sujet agit non selon un simple vouloir, mais selon un "vouloir" régi par le "devoir" imposé par le cadre axiologique qu'il s'est choisi.

Ainsi vu qu'il s'agit de son identité ou plus exactement, l'image qu'il veut donner de lui-même et qu'il veut afficher, le sujet préfère ignorer encore lui-même et rester dans une négativité sans protester et lutter contre les coutumes de sa société.

6. Conclusion

En effet les éléments qui affectent toute la vie du sujet renvoient déjà à une croyance religieuse et à une pratique culturelle. La présence du sujet est niée par des conditions historiques et sociales alors que l'interdiction des femmes de leurs droits naturels dans les pays qui sont libérales serait considérée comme un choc culturel. De même, dans la société où les droits de la femme sont ignorés par une nécessité culturelle et religieuse, on voit comment la négativité émerge sous l'aspect intérieur de la culture iranienne. Ainsi, la pratique culturelle renouvelle le sens de la vie.

ETHNOSEMIOTICS: APPROACH TO TRADITION AND CULTURE

SEMIOTIC APPROACH IN DETERMINING FUNCTION AND SEMANTICS OF RITUAL GESTURE

Dzheni Madzharov
St. Kliment Ohridski University of Sofia, Bulgaria
madzharov.dzheni@gmail.com

Abstract

This report proposes a new approach to solving some of these problems. As the basis is used the principle that each human movement, laden with meaning, is a sign in semiotic sense of this name, and is called *gesture*. The same holds key features that distinguish it from other similar gesture. The establishment of these features and their analysis allows, at any particular use of a gesture, precise to determine its actual role and importance in the text of the relevant ritualized action (ritual, custom, celebration). These basic characteristics, that are inherent to any gesture, form the so-called *system of dimensions of ritual gesture*. The system includes the following five dimensions: physical form of gesture, environment, relationship between addresser and addressee, function and semantics. The paper examines the content and the scope of each of these dimensions. The provided scientific method allows after specifying the first three dimensions of the studied gesture to establish its current function and semantics for each particular use. The results make it possible to determine the exact purpose and meaning of each researched ritualized action, which involves the studied gesture. The method allows the identification of already missing functions and semantics that this gesture has manifested in various historical stages of its existence. Through this approach the ethnology science may reveal the mechanism of transmission of tradition and the creation of ethnic character of each culture.

Human communities use gestures to communicate in everyday life and in performing ritual actions. Most of the human movements in everyday life have meanings, which are limited only

to the content of their physical execution. However, in ritualized human behavior the gestures are always loaded with a connotative meaning. Ritualized gestures are poorly studied by Ethnology. Inaccuracies are allowed in scientific research very often when we find out the origin and nature of certain phenomena in culture. This is the result of neglect or wrong explanation of gestures, which are important elements of the ritualized action. Therefore, this paper offers a new approach for the study of ritualized movements and actions in the culture. This is an opportunity to clarify the exact purpose and meaning, function and semantics of the gesture in a ritual, custom and celebration.

Because of the fact that Anthropology, Ethnology and Folklore do not offer such a suitable method for the study of a ritual gesture I use a semiotic approach. This approach to the study of signs suggests a separation of gesture's form from the information, which is conveyed. This is an extremely important point, because very often the same physical form of gesture is the carrier of two or more different information contents. There are also reverse cases, when several gestures with a different physical form, convey the same information content. That's why the clarification of the information conveyed can be done only in the context of communication, because of this I accept the idea that each loaded with meaning movement, which participates in this process, represents a semiotic sign.

It is well known that the relationship between the form of the sign and its content is conditional and arbitrary (Crapo 2000: 186). Likewise, the relationship between the form of the gesture and its meaning is arbitrary and it is the result of a public agreement. The gesture is always used in a sign system, where it has a specific meaning, which is agreed in the community. In this case, the physical form of a gesture beside a carrier of meaning does definite activity in this sign system. In other words, in the composition of a ritualized action the gesture always has a purpose and meaning. But like a sign it has also a *function* and *semantics*.

In every ritual action, which is a part of a sign system, gesture besides a denotative meaning often has also a connotative one. There the gesture most often acts as a symbol that replaces non-attending in the ritual action object (person, event, idea, etc.). So with the participation in a ritualized action a gesture creates the *text* of the action. Outside the framework of a ritual action, time and space the gesture often loses its accepted connotative and sometimes denotative meaning. Furthermore executed outside the scope of a ritualized action the gesture is deprived of the agreed in the community standard ritual function and semantics (Tolstoy 1999: 469). There, outside the sign system of a ritualized action, the gesture is mostly just an ordinary human movement without informative or communicative value. Therefore the researched gesture should be studied and analyzed mainly in the context of the sign system (culture) where it actively exists.

Due to the close links between gesture and ideology (religion) it is imperative that the ethnological study should always be careful about the impact of this system, because it influences the use of gesture and creates its contemporary meaning. That means any gesture form can change its content. On the other hand, gestures in culture are dynamic and changing phenomena. Sometimes gestures change their role not only in ritualized action but also in the composition of the whole culture. However, any member of the community knows their actual purpose and meaning in life. How is that?

The main task of the science is to discover what are those characteristics that allow the person to recognize the exact purpose and meaning of the gesture in a given situation. This supposes to find out some characteristics of the gesture that determine its specific purpose and meaning in the context of a studied ritualized action. Like the words in a language the gestures don't exist alone, only for themselves. It must be stated that the sum total of all gestures in a culture, like the words, make up their language. This language has generally accepted rules that determine how to use gestures (Popova 2004: 70). My task was to find out what those rules or characteris-

tics of the gesture are, that allow the person to determine exactly which of the many meanings of a particular physical form of a gesture to apprehend at the moment. After many studies I have found out that the rules are more like characteristics that determine how to perceive the purpose and meaning of the gesture. These characteristics of the gesture I accept to call *dimensions*. The use of this concept makes it possible to capture and present the whole complex sum of information such as: what the signified human gesture looks like; describes its physical form; the conditionalities that accompany the use of gesture; the interaction between sender and perceiver of gesture; the purpose and meaning of a gesture in a ritualized situation, its function and semantics etc.

According to Ferdinand de Saussure the meaning of a sign is determined by its interaction with other signs from the system (Popova 2004: 70). Because of the special mode of use in a ritualized action gesture has a function and semantics that are understood only in the context of the sign system. Upon removal the ritual gesture out of this sign system its function and semantics change and even disappear. This means that these two dimensions of gesture have conditional nature and are a result of a public agreement. They depend on the sign system and also on the particular language of gestures. By the ethnological research each ritualized environment determines the specific purpose and function, meaning and semantics of a researched gesture. This requires a detailed examination and analysis of any phenomenon in the culture, which composition contains the studied gesture.

It is well known, that human movement, loaded with meaning, becomes a *gesture* only as a result of semiosis that allows the adoption of agreed meaning. In ethnological sense semiosis is this moment, in the scope of a ritualized action, in which a human movement is played in *standard* and *stereotype* way, according to the knowledge and expectations of the community. In this way the human movement becomes a gesture or more precisely a *symbol* that has a ritual purpose and carries a specific meaning.

To understand the researched gesture is necessary to consider the characteristics of the specific environment in which semiosis is achieved. This allows us to identify those elements of the environment that create the purpose (function) and meaning (semantics) of gesture. These invisible, but bound in a system elements, I call *system of dimensions of ritual gesture*. By *ritual gesture* I mean anyone involved in a ritualized action. The use of this system for the study of gesture allows all information to be accurately described and traced in development. Thus can be analyzed the mechanism for setting (changing) of each purpose (function) and meaning (semantics) of the gesture.

1. What are the elements in the system of dimensions of a ritual gesture?

With the use of a gesture in ritualized action it can be clearly distinguished the gender, age, social and ritual status, kinship, local, religious and the ethnic identity of the participants. The gesture shows the ritual status of those who perform it, but also to whom it is directed. By gesture analysis it is obligatory to consider its external visible shape, which I call *physical form of the gesture*.

In a ritualized action the physical form of gesture is used in conjunction with objects, clothing, time, space and other elements of the environment which are loaded with meaning. They all have an impact in the creation of purpose and meaning (function and semantics) of the gesture. This dimension of a ritual gesture I call *environment*.

Each gesture is performed by someone or something. In ritualized action the gesture is necessarily directed at another individual or entity that is a participant in the communicative process. In this way the reproduced gesture creates a connection between the sender and the perceiver, which I call *relationship between addresser and addressee*.

The reproduction of a ritual gesture is never an action without a purpose. That human be-

havior may be a practical one, but there is always a symbolic purpose in it. In the science, this characteristic of the gesture is called *function*. The ability of gesture to influence is one of its main quality.

In the scope of a sign system every gesture means something. *Semantics* is its second main quality.

The above mentioned five characteristics form the *system of dimensions of ritual gesture* that accompanies and defines the way for its use in any sign system (like a culture). The use of this method for the analysis of cultural phenomena makes it possible to reveal the exact and current function and semantics of the researched ritual gesture. This allows to determine the true purpose and meaning of a studied ritualized actions, in which the gesture is involved.

2. Detailed content of each dimension.

2.1. Physical form

This dimension includes the visible part of each loaded with meaning movement of the human body and its limbs, torso posture, facial expressions, movements of eyes and eyelids. In analysis of the form we should pay attention to the level, on which the gesture is performed - in vertical and horizontal, interlokutativly and also to the direction of movement - to the side, away or towards the body of the sender. *Realization*, as a part of this dimension, means what is the quality of performance of the gesture. Whether, according to the standard of community the gesture is performed in its whole content or in a part, with the use of emotion, effort or only schematically. *Standard* is a system of common rules and restrictions for the performance of any ritual gesture, which is agreed by community and each participant in the ritualized action is required to comply with them.

2.2. Environment

This dimension includes all loaded with meaning elements of the ritualized environment, which are involved in gesture performance such as: place and space; time; objects that are loaded with meaning; clothing of addressers and addressees; gestures accompanying verbal forms (words, phrases, songs, etc.) local, religious, social, political and other circumstances; features of ritualized environment and situation; and all other objects, phenomena and factors that accompany performance of gesture or have something in common with establishing and clarifying its function and semantics.

2.3. Relationship between addresser and addressee

The relationship between the performer (sender) of a gesture and the subject (object) to whom (which) it is directed is not always entirely clear. This connection beside its visible plan very often has an invisible one, too. In ritualized communication the sender always knows, that it is seen not only by those who are attending the event, but also by the forces of the Transcendental world. In this way the supernatural forces are directly involved in ritualized communication. Therefore often the performed gesture is not a personal expression of the individual, but a result of the will of those forces. So the ritual character – the addresser that stands on the visible plan is only the earthly representative (agent) of the Transcendental forces. This is the reason why we are forced always to seek for the addresser/s in the invisible (mythological) plan. Likewise, we should look for addressees of the ritual gesture that are on an invisible plan. Disclosure of addressers and addressees of the invisible plan is one of the major difficulty for the proper determination the purpose (function) and meaning (semantics) of researched gesture. Difficulty raises the fact that sometimes in ritualized communication the role of a character, with whom the gesture is connected, plays not a man, but an animate or inanimate object. Thus in the communicative process this object often acquires human characteristics (Bayburin & Toporkov

1990: 7). When we examine the relationship between sender and perceiver we always take into account the composition and status of the participants, and analyze their following features: ritual character; sex; age; number; relationships between the participants when performing gesture - in synchronic and diachronic perspective; degree of acquaintance; social status; local, religious, ethnical and national origin; the symbolic value of the subjects and objects that play the role of the addresser and addressee. The disclosure of these details is crucial in the analysis of gesture, because even a small change in one of these elements leads to a change of purpose and function and, meaning semantics.

2.4. Function

This dimension of the gesture is not always clearly distinguishable and understandable. Very often not only bearers of culture, but also researchers can not distinguish the function from the semantics of gesture. The reason for this is that the gesture is not seen as a semiotic sign that has three sides - form, function and semantics. Therefore it is required a thorough examination what use has the studied physical form of the gesture in different local manifestations of sign system (culture). Function is a characteristic ability of the ritual gesture: to mean or to represent another object; to carry information and to store knowledge; to load objects with meaning; to serve as a means of communication and circulation; to influence physically, mentally, metaphysically; to transmit feelings and moods, etc., all this in the process of a ritualized action. Put in a simple the function of gesture is the performance (activity), it does in the process of transferring information from sender to perceiver. Function is also the result that is derived from the influence of the gesture on the participants (subjects, objects) in a ritualized action. Because I'm looking at the gesture as a semiotic sign I accept that it performs the same functions as any other sign. But because of the special physical nature of the gesture a part of the famous semiotic features, characteristic of a verbal sign, are not inherent in the gesture. So I think the functions of the gesture are limited to the following sixteen: *nominative*, *cognitive (significative)*, *symbolic (representative, referral)*, *communicative (denotative)*, *pragmatic*, *appeal (conativ, regulatory)*, *contact (faithic)*, *deictic*, *symbolic*, *emotive*, *expressive*, *aesthetic*, *poetic*, *magic*, *ethnic*, *metalinguistic*.

2.5. Semantics

This complex dimension of a ritual gesture is settled last, after analyzing all factors that accompany the performance of the studied gesture. Only when any human movement, reproduced in ritualized action, fits into public contracted standard and begins its repeated and stereotyped application, then we can talk about the emergence of its sense, meaning. To clarify the actual meaning of the gesture it is necessary to trace the entire sum of the specific circumstances in which it is applied. This collection of all established meanings of gesture in the context of culture describes the range of its current semantics (Bayburin & Toporkov 1990: 21). In semiotics the term *semantics* (synonymous with *meaning of the sign*) is one of the most meaningful and harder to define, because different schools have different opinion on its scope and content. According to the linguistic semiotics *semantics* is the *sense* of the gesture as a sign, which is located in the mind of its interpreter, what he/she perceives (interprets) as an image, concept, idea, etc. Under the semantics of gesture we understand the overall plan of content of the sign with its denotative, significative and connotative meanings, including its semantics' value.

The existence of gesture in culture and mainly in a ritual, custom and celebration implies a more complex state of its semantics. Therefore, Alexander K. Bayburin and Alexander L. Toporkov introduce two concepts of specifying the semantics of the gesture as *motivation* and *explanation*, which possess different aspects in culture. By motivation they understand the explanation of gesture's meaning that gives the carrier of the culture. By explanation they understand that meaning of the gesture, which has a broader (territorial and chronological) character and

is find out as a result of systematic research (Bayburin & Toporkov 1990: 18–19). Motivation level of semantics incorporates all those current, simple and common sense ideas and concepts with which bearer of the culture explains the meaning of the gesture. It can highlight aspects of the group, local, social, ethnic and religious interpretation of the meaning of the gesture. While established after a scientific study motivation reveals the logic for appearance, reasons for public negotiation and enforcement of this meaning, and its historical continuity of existence.

Due to continuous changes in the conditions under which is created the actual semantics of gesture we can not expect to be maintained all its motivations and explanations existed in culture. However, in different historical layers of the culture are stored separate data for the passed by meaning of the gesture in the form of words, phrases, prohibitions etc. The total sum of this protected information I call *memory of the gesture* (Bayburin & Toporkov 1990: 19). To semantics (motivation level) of gesture is applied its ethnic (local and national) name. And also, all verbal forms, which are coming from, can be connected with or related to the studied gesture as words, phrases, idioms, the memories of one of its sense, meaning. Most often verbalized forms of gesture semantics and function appear as a result of its removal out of rituals, customs, his profane use or disappearance of community life (Tolstoy 1999: 482, note 11).

In ethnological study of culture there are two possible approaches for implementing the method system of dimensions of a ritual gesture – *synchronic* and *diachronic*. In the synchronic approach the research phenomenon (ritual, custom, celebration, ritualized action) we divid into main parts to determine which gesture (action) constructs the structure of the phenomenon. We are looking for other identical or similar physical and meaning forms of this gesture in the culture, and then analyze their systems of dimensions. This allows us to determine precisely the actual function and semantics of the researched gesture. In diachronic approach we study the historical development and changes of purpose and meaning, function and semantics of the researched gesture. We analyze various ritualized actions from the past and present of the culture, in which the researched gesture participates, in order to determine the sum of all its changes.

On my experience so far, the presented method for the study of ritual gesture, can be successfully applied in the analysis of any ritual gesture and household behavior that exists within a sign system. When the method is used in a comparative study of similar phenomena in two or more cultures, it allows us to trace and reveal the mechanism by which are created and developed the ethnic features of these phenomena, as well as how is build the ethnic character of each culture.

Abstract

This paper examines the argumentative features and semantic discourse potential found in Eça de Queirós' *The city and the mountains*. The notion of speech is focused as a source of meaning and persuasion. A mix of speeches is produced as a result of an enriched storytelling, a remarkable skill of the author who employ a multiplicity of voices as found in the Dostoevsky's model. The concept of polyphony discussed by Bakhtin (2011) in "Problems of Dostoevsky's poetics" is used to explain this operation and grasp the meanings found in the characters' wide-ranging discussion. The presence of two voices at first distinct, but afterwards integrated into dialogues and narration is not simply opposition, but a divergence that shape the argument and provide contrasting and complementary meanings. Voices that overlap in the same context and merge into a third voice with argumentative power and ability to clarify the theme in the novel. The argument is further built, to a larger extent, by the use of adjectives, thus releasing statements that this study will point out as countermeanings, a notion inspired in the psychoanalytical concept of countertransference, to cover differences that are not purely oppositions, but disagreements and agreements that can be worked out.

Introduction

The city and the mountains by Eça de Queirós takes into account two postures: Jacinto de Tormes's (the novel's protagonist) and José Fernandes's (his best friend and narrator). Jacinto de

Tormes, born in Paris, is of Portuguese descent and is the heir to a vast estate located in a village in Portugal. He never visited the place, but rental incomes from that family property allow him to afford his living in the metropolis. At a certain point in time, he started to become bored and disappointed with life among all sorts of appliances and devices available in modern urban life, plus the rush that was becoming typical. It was then that he received a letter from the estate manager, José Fernandes, notifying him that for a decision to be made, his presence was required in the farmland. Fernandes travels to Paris to see Jacinto about the issue and to persuade him to come to Portugal – and so it happens. Upon this return to roots, with the contact with the country environment, Jacinto started reflecting about the sense of life with technology and of life without it. Fernandes takes part in the plot with more than his dialogues with Jacinto: he lends his voice as a narrator.

In spite of being distinct, they exert forces of equal magnitude: none of these characters' voices overlap. Jacinto, heir to a profitable estate in the country, is delighted with Paris cultural and technological effervescence in the context of the beginning of the 20th century. He lives in a two-story house, in the city centre of the French capital and, at a certain point, hosts his best friend, who has just arrived from Portugal, José Fernandes that, as opposed to Jacinto, is eternally in love with Portugal and the quality of living associated with country life.

From that moment on, in their daily interaction, Jacinto and José display different attitudes towards the same contexts. The perspectives, however, add up to each other and alternate in the meantime, eventually generating a third perspective, which is an evolution of the previous two. Hence, the relationship between the hereby named meaning and countermeaning, further explained. José Fernandes is granted the freedom to assess and interpret his friend's attitudes as well as to establish not solely a dialog with him or between characters, but also an interaction with the reader who is involved and clearly realizes Jacinto's psychological transformation as he absorbs the contents of the arguments presented by his friend.

In order to more easily perceive the characters' consciousness modifications, the analysis will be divided into three times: Time 1, in which Jacinto falls for Paris; Switching Time, where the character is already bored and uncomfortable in the metropolis and Time 2, when they are already in Portugal, displaying love and working for their homeland. The discourse that depicts Jacinto's feelings regarding both cities where he lived is built with the use of the adjectives – this process here known as a resource of argumentative construction.

It is assumed that the book's argumentative construction has its main expression in the judicious use of adjectives, capable of allowing a deep thematic discussion with a surprisingly degree of utility for the present-day. That is attained through an undisputable capacity to assign many voices (not to be thought as lines or dialogues) to few characters allowing access to meaning and manner as they become reality.

1. The meaning and countermeaning relation

The characters represent human conscience with great support in reality to the extent that their interactions simulate or portrait daily facts. Therefore, the interaction between Jacinto and José Fernandes also occurs in an unconscious way: the two characters that at first show very different postures under the same circumstances will dissolve their contrasts and merge, embracing their unconsciousness and establishing a more advanced posture emerged from their emotional response.

José Fernandes' dense narrative is able to comprise Jacinto's evaluation and along with it compose a new meaning to the concept of happiness that lies in human conviviality in their homeland. This is accomplished by the double role or double voice assigned to José Fernandes in sharing the instance of narrator. This new posture, comprised by the overlapping of both char-

acter's views, starts to belong also to the reader that through argumentative resources dialogues with the text and realizes their concepts change.

The term countermeaning is adopted with a special connotation. The prefix counter, largely applied in already renowned expressions such as counterculture, counteract, counterclockwise, among others. A concept that best represents the desired definition is the psychoanalytical notion of countertransference. According to Freud (1912, p. 113) transferences "are new editions or reproductions of the tendencies and fantasies which are aroused and made conscious during the process of the analysis, but they have this peculiarity that they replace some earlier person by the person of the physician." The psychoanalyst believed that this emotional transference is expected, but the professional is not to allow the phenomenon to interfere in their analytical posture.

Countertransference is the name given by Freud to the situation in which the analyst is emotionally involved and integrates the transference phenomenon, which, according to Leitão (2003, p. 176) "is the analyst's emotional response to the patient's stimuli." The transference and countertransference processes hold ambivalent natures, once the feelings that may be aroused develops from a human relationship and as such have double composition, that is, postures that present themselves in different ways under the same therapeutic context but that with the sessions' evolution along with human interaction between these individuals become a shared posture between the analyzed and the analyst.

The term created by Freud in German: *Die Gegenübertragung* can be divided for a Portuguese version as indicates Orozoco (2000, p.137, apud Antonelli 2006, p. 25, our translation): 1) *Gegen*, from opposition, 'against' 'that opposes to', but also holding the idea of reciprocity. 2) *über*, that means on, in the top of. 3) *tragung* that comes from the verb *tragen*, to carry, take. Therefore, according to the same author the term "against" in Portuguese does not contemplate every aspect of the word in German, once the latter carries the idea of reciprocity, integration. Consequently, countertransference is not characterized by the opposition but by the reciprocity of postures that at first are individual and only existent in the personal unconsciousness but that evolve to an emotional completion that coexists in the relation established between the person analyzed and the analyst.

Freud (1912, p.402) claims to have "(...) good reasons to assert that everybody possesses in their own unconsciousness a tool enabling them to interpret other people's unconsciousness elocutions". This is the point of interface between the idea of counter transference and the concept of countermeaning which have no further resemblance. There is, therefore, the entanglement of two different consciousnesses that individually possess forces of equivalent magnitudes that merge and unite from a relationship that may have an argumentative nature. It emerges from the possible interpretation of such consciousness that then become one as a result. Jacinto e José Fernandes are examples of this relation as people who are daily together and have different attitudes at first. During the story they unite and compose a third attitude. Being able to conduct such a process demands the handling of multiple voices at risk of harming access to subtleness, small details or nuances. As a result, the argumentation is built through a sophisticated process of use of adjectives that is associated with the characters' positioning (meaning and counter-meaning), turned to the construction of thought.

2. Polyphony

The narrator's and the main character's voices merge and compose the before mentioned relation. "The consciousness of a character is given as someone else's consciousness, another consciousness, yet at the same time it is not turned into an object, is not closed, does not become a simple object of the author's consciousness." (Bakhtin, 2011, p.7) The characters are not still

voices in the plot, but representations of consciousnesses that, as in human relations, intertwine and recover themselves. This is the process described by the relation between meaning/counter-meaning.

According to Bakhtin (2011, p.6, author's italics): "(...) rather a *plurality of consciousness, with equal rights and each unit with its own world*, combine but not merged in the unit of the event. Dostoevsky's major heroes are, by the very nature of his creative design *not only objects of authorial discourse but also subjects of their own directly signifying discourse*." Polyphony, particularly in this Eça de Queirós's work, not only designates the mixture of voices present in the text, but also presents the independence that each character is given by the author, making them different subjects, masters of their speech and autonomous enough to interact with other voices. They are, therefore, free to be built from that relation controlled by the author, but does not only evolve from him hands: the subjects of this newly created speech may generate new interactions and change.

The novel is to Bakhtin (2011) a typically polyphonic genre once that, in presenting various social voices that confront, collide, represents distinct postures and worldviews that converge to an interaction. In *The city and the mountains*, the two main voices correspond to such definition as their postures and consciousnesses converge to a union – they persuade each other and unite. Postures and consciousnesses that are opposed at times and similar or completing each other at others – consequently, they are not individual but composed by the voices and their union.

The author's perception of the work is essential for the polyphony's maintenance through the narrative. The characters are portraits of the human psyche thus, text and reality should overlay. The voices settle in the reader's mind, taking into account that he becomes familiar with polyphony and makes the characters' interaction something real and feasible. According to Bakhtin (2011, p.37):

Dostoevsky had the seeming capacity to *visualize directly someone else's psyche*. He looked into someone else's soul as if equipped with a magnifying glass that permitted him to detect the subtlest nuances to follow the most inconspicuous modulations and transitions in the inner life of a man. Dostoevsky, as if *passing the external barriers*, observes directly the psychological processes taking place in a man, and fixes them on paper...

Eça de Queirós in Portugal, similarly to Dostoevsky (just in procedure, no further comparison meant), also portrayed his reality, his culture's reality, his compatriots' and a period of time. He became eternal by portraying human mind's reality through voices that overlay and are pronounced, becoming every so often either Portugal or the he himself.

4. Analysis

The novel is narrated by José Fernandes, the protagonist's, Jacinto Tormes, best friend. The text is formed by the two characters' distinct views on happiness. While narrating Jacinto's crossing of two countries, Portugal and France, José constantly intervenes with descriptions and evaluations. His friend's and his own attitudes gradually become clearer while he, as a narrator, composes Jacinto's imaginary place and as an interlocutor in directly dialogues with the protagonist.

While living in Paris, Jacinto shows himself as someone in love with technology and incapable of living without urban life's facilities. However, his inseparable friend and story narrator's company gradually brings about another feature of his character: in returning to Portugal and country life he realizes that happiness is not in luxury, but in the country's bucolic life. The

Lusitanian fighting spirit and the author's love for such land become clear when one observes Jacinto's radical opinion changing upon realizing country life's potential.

Nature's defense does not assume a laudatory characteristic on the stillness and exiguity of Portugal's country life in that moment. In fact, it occurs in order to enlarge the Lusitania spirit in its active and laborious feature. Both lusophony's view – José Fernandes's, that praises and regards it as synonym of accomplishment, and Jacinto Tormes's, that regards it as old-fashioned and decadent – merge showing Portugal's strength and the world diffusion of its culture. The narrative is an example of how the discourse resources may contribute to the construction of new meanings.

The use of adjectives employed bears criticism of costumes and the description of social values at the time. In raising the relation meaning/countermeaning through usage of adjectives, one has access to rich possibilities of expression and through them to a better integrated and advanced comprehension of an idea. In other words, the protagonist returns to his homeland with a new vision, more valuing and also enriched that also comprises a more exempt and absorbing evaluation of the environment customs that had temporality embraced him.

The adjectives are used to assign a new meaning to another term already endowed of meanings. On the other hand, the adjective inserts the reader into the production context as it stimulates the dialogue between him himself and the text through the stimuli of the interlocutor's capacity of articulation and imagination. This term allows truth and meaningfulness "to the context but, above all, to the noun that follows the adjective and that pours in it a bit of its soul" (Lapa, 1998, p. 125, our translation). "Through the adjective, the speaker emotionally characterizes the being talked about; through the abstract noun highlights feeling, quality and state, presenting it with more enhancement, less tied to the being (...)" (Martins, 2012, p. 107, our translation).

Therefore, the process of adjective use is the semantic union between the proprieties the noun already has and the persuasive arsenal sustained by the characteristics carried by the adjectives. Such process induces the reader to a reflection where the narrated context is imagined, making it concrete in their imagination and inserting them in the work. The argumentative process makes the character's voices and consciousnesses real in the interlocutor's mind. The polyphonic construction is the ideal space for the adjective as an argumentative resource to carry all its argumentative potential in a clear and noticeable way.

Predication is the process of assigning a statement to something positioned as the subject. Whether the subject is a verbal or nominal action to whatever extent, even phrasal, it promotes a description or makes a comment. Hence, predication has the adjectivation nature, develops the narrative and makes the textual voices move as the characters' consciousness components. It also has the benefit of engaging the reader in exciting and surprising interactions.

The analyses are composed of the narrative division in three distinct moments: the first displays Jacinto's love for the metropolis – Paris, the second concentrates on the switching of this posture already under José Fernandes voice's influence to a more contemporary view on happiness and the third blends both characters' voices and show true happiness once they return to Portugal. These consciousnesses as the awareness if the times presented in the narrative [Time 1 (T1), Switching Time and Time 2 (T2)] are polyphonically linked and become clear through the use of adjectives and predication.

T1

This part of the narrative presents Jacinto inebriated by Paris's charm and falling in love for all that is new. He is dependent on technology's innovations and comfort. The metropolis is pictured as the sole possible source of happiness to the character. When the narrator describes this attitude, he presents an appraising tone perceived by the usage of adjectives in the protagonist's

voice when reported in his friend's words on value judgment. Consequently, the reader feels that both have totally different opinions about such topic.

In the following text one can observe Jose Fernandes's appraising narrative regarding his friend's consciousness while describing his concept of happiness: "(...) a man can only be superlatively happy¹ when he is superlatively civilized." (Queirós, 2008, p.7). The highlighted adjectives display the symbiosis between being happy and civilized, two adjectives that are only valuable once together, that is, they have their complete meaning at the moment they appear together in Jacinto's consciousness and in the strength of his voice.

In another excerpt the narrator, through adjectives, describes how his friend's consciousness works and lists what is considered to be civilized to him. However, every lexical choice grants the speech an appraising tone and proposes the merging of voices once that Jacinto's consciousness only takes shape in José Fernandes's appraising process, as he needs to analyze his friend's chosen postures prior to narrating in order to attribute strength to the voice. "(...) Jacinto's idea of Civilization was inseparable from the image of the City, an enormous City with all its vast organs in powerful working order." (Queirós, 2008, p. 10) The use of the highlighted adjective indicates the metropolis' dimension in Jacinto's mind, but does not provide the description with reality, once José Fernandes neither agrees with it nor visualizes verisimilitude between it and Paris' reality.

In the excerpt, José Fernandes refers to his friend as "my Prince", predication that works as an epithet. Prince of Boa Ventura is the total expression of his esteem towards Jacinto and the acclamation of what he symbolizes to Portugal. Another character arises to emphasize all of the technological occurrences acquired at the two-store house and to show the strength such opulence holds in the narrative. "(the Countess de Trèves) was marveling at my super-civilized Prince's sumptuous collection of machines and instruments." (Queirós, 2008, p.50). There is a sequence of three positive adjectives that have their semantic fields joined by the part Jacinto's consciousness that considered the mechanics of his residence his only source of happiness.

During Time 1, in which the metropolis is valued, there is also the depreciation of the mountain by Jacinto's consciousness in the voice of José Fernandes, noticed through the adjectives implying how tedious the protagonist considers the country life to be. "And it seemed to him (Jacinto), too, that there was a kind of fickle melancholy about the forms and shyapes of certain inanimate things: the futile sprightly haste of streams, the bald rocks, the contorted trunks of trees, and the silly solemn muttering of leaves." (Queirós, 2008, p.13). Although Fernandes's narrative is faithful to Jacinto's approaches, it is also distant, given that those thoughts do not belong to the narrator at any given moment.

Time of Switching

In this part of the story, Jacinto appears to be bored with the empty life of civilization. In José Fernandes's narrative his voice and consciousness as a character acquire space and the strength of both voices becomes the same as their speeches begin to merge and the positions facing daily events start to match.

In the following excerpt, the narrator's voice arises on its own. He does not describe as his friend thinks or acts, but evaluates the context where he lives and shares with his friend. His voice emerges unaccompanied and gathers persuasive strength through the chosen adjectives and adjectival phrases. "(...) in this (the City) highly unnatural creation (...) man seems a non-human creature, without beauty, strength, freedom, laughter or feeling(...)" (Queirós, 2008, p. 93) The adjectives possess a negative semantic charge and come in multiples, that is, there are six expressions used in the sequence that able to qualify, punctuating the reading and promoting

¹ We highlighted some adjectives in quotations of The city and the mountains that will be dealt with in the analysis.

persuasion. Besides, Jacinto and the reader when faced with such structure visualize a semantic unity composed by the sum of these adjectival phrases turning what was already bad into something worse.

The next excerpt points to Jacinto's transition of attitude. The narrator describes his friend's worldview no longer in a radical way, as he sees himself in doubt and the city as something negative and harmful. Such change is owing to the strength assigned to José Fernandes's voice that becomes as much or more important than Jacinto's at this point and he starts to speak for himself and for his friend. "Perhaps the City is just a perverse illusion!" (Queirós, 2008, p.94)

In this other excerpt, José Fernandes's voice is again free and with appraising strength. His consciousness now works for both postures, building in his friend's voice, a new place, invading his imaginary and modifying his worldview.

(...)in the inconstant and skeptical City of Paris he was surrounded by ever active and ever faithful friends; N° 202 was filled to bursting with comforts (...) and yet still he was sad. (...)his sadness – that gray hairshirt in which his soul was shrouded – came not from him, from Jacinto, but from Life, from the regrettable, disastrous fact of being alive! And thus the healthy, intelligent, wealthy, well-loved Jacinto slid into Pessimism. (Queirós, 2008, pp. 111, 112)

The last excerpt of this time of switching again indicates love for Portugal with its gentleness and kindness as homeland in José Fernandes's voice. Now the focus is no longer on being in the metropolis as there are neither criticisms nor praises to Paris now and the story focus switches from the French city to Portugal and its appeals that start to be noticed by Jacinto and the reader, who is convinced, along with the main character, using the adjectives as an important argumentative resource to the text voices adaptation. "Ah, little mother Portugal, still so kind to her children!" (Queirós, 2008, p.119)

T2

In this last narrative moment, happiness becomes synonym of country life for both characters. Both voices and consciousness that would follow distinct paths now unite and converge to the same reasoning. Meaning and countermeaning converge and complement each other. The characters now use all knowledge and technological evolution acquired in Paris in favor of their homeland and find a third posture that mixes all the other voices to make Portugal their source of happiness.

The voices in this excerpt resonate together as José Fernandes narrates it with his and his friend's consciousnesses. "And soon, in the face of the incomparable beauty of that blessed land, all our ills were forgotten!" (Queirós, 2008, p.149) The positive adjectives now characterize the Portuguese mountain and the narrator no longer drifts apart from the information. On the contrary, it makes it his unconscious portrait.

The union of voices is established in the following excerpt: "And may we stay here with you always, you welcoming, fertile, peaceful mountains, most blessed of all mountains!" (Queirós, 2008, p.159), in which the narrator's voice emerges in the plural. The narrative's external plurality of voices and the sequence of adjectives show that the love for the mountain is shared by both characters' consciousnesses.

In this excerpt, the narrator describes his friend's happiness in feeling as if he belongs to the country, is a product of the land so beloved by the two of them. "(...) a long, loud, healthy, genuine guffaw made me start awake and force open my heavy lids. It was Jacinto, sprawled in

a chair (...)” (Queirós, 2008, p.183). The sequence of adjectives allows the semantic sum of their meanings. Jacinto’s laugh, that is, his happiness is characterized by the sum of all these positive characteristics and is now intrinsic to his voice and consciousness.

At last, the narrator inserts a metaphor, a figure of speech that consists on the internal comparison between one element, here Jacinto, and another, a tree. This comparison search for common elements that allow an interface between the chosen words. In the story, the choice of a tree was not in vain as Jacinto, once in love with technology, now surrenders to country life appeals and can therefore, be associated to it by the narrator who had active participation in his friend’s switching of consciousness. Such metaphor becomes more evident by the uses of the adjectives at times linked to the vegetables at others linked to human beings. “(...) that withered branch from the City (Jacinto) replanted in the mountains, had taken root, sucked up the humus from that inherited earth, created sap, set down more roots (...) and burst into flower – strong, serene, happy, beneficent, and noble, producing fruit and providing shade.” (Queirós, 2008, p.259)

The argumentative process at this point presents both characters’ voices that in turn are very close, so united that they represent the same consciousness and the same reason why they seek happiness and find it. The plot comes to an end and each character views are the result of everything that was confronted by them during the narrative.

Final remarks

Argumentation within a literary text follows many paths and this work attempted to produce a study regarding the argumentative construction of the relation between meaning and counter-meaning that emerges in the work founded on polyphonic construction. The central element is the use of adjectives as it is the process by which the narrative can contribute with the meaning formation with depth and sophistication. The employed adjectives bear the characters’ voices in each assessment and we realize, in every description, the positioning of Jacinto and José Fernandes due to the direction the adjectives assign to the narrative. This argumentative resource deals with the costume criticism and the social values description at the time.

All of these promoters compound the Queirosian work and combined integrate a unique and characteristic language. The idea of countermeaning is seen as an outcome of such match: Jacinto, the protagonist, has before him a group of arguments that may lead to two distinct interpretations. In other words, the same situation during the whole context of the story generates double positive – negative reading; excitement – indifference, affection – rejection and other counterparts that persuade the reader to interact with the voice that conducts the text. In the end, the main character realizes that his country and village are his best reference of home and happiness. This posture was conducted through the text mainly by the use of adjectives contained in their present countermeaning. And this is the aspect one wished to achieve in this research.

The study of the argumentative elements and the formation of the countermeaning in *Eça de Queirós’s* narrative is, therefore, the uniqueness we attempted to grant the work. The novel is intended to be focused on association with the evaluation of such resources to facilitate the understanding the characterization of the habits met by the character in two different social contexts and compare them. As a result, it is also meant to get to know better how the writer uses argumentation as means of scrutinizing the urgencies of the early 20th century society, marked by the never-ending search for new technologies.

Two views that, at first, are divergent but as the story unfolds merge and form a third, composed by the previous ones. This new conception of happiness also starts to belong to the reader, whereas the argumentative resources form the text so that this dialogue emerges from the work and settles in the imaginary place of the interlocutor.

MONEY TALKS: A SEMIOTIC EXPLORATION OF MONEY AS COMMUNICATION

Christopher M. Bingham
University of Oklahoma, USA
bingham.christopher@gmail.com

Abstract

Money talks. While many have heard and even used this adage in their everyday communications, few have taken the premise of this statement at face value. In this paper I posit that money is itself a form of communication and that the examination of money as communication can broaden our understanding of the human experience. Additionally, this paper attempts to answer one of the central questions posed at the intersection of Semiotics and Marxism by suggesting that money is an appropriate object for study in this endeavor. One basic premise of Marx's social analysis is that the base determines the superstructure; that material (and economic) relations influence our thoughts and expectations about how society works. As the preferred form of capital, money – the medium through which our material relations are performed – structures our interactions and our perceptions thereof.

To clarify, I am less interested in symbolic work that plays out on the physical vessels of money (e.g., dollar bills) as these aspects have been explored by Shell and Tschachler. All forms of money – the bills, the coinage, the credit card swipes – are sign vehicles which point to abstract form of value – just as the word “hello” carries similar meanings whether it is traveling by vibrations in the air molecules or electrons moving down a copper wire toward one's telephone. This paper is concerned with the communicative power of money itself, not the physical object that carries or references it.

For this endeavor I present a four-cell typology of money's communicative processes. First, money speaks through positive movement, as can be seen at the instances of purchase and sale.

Second, money speaks through visible inertia, or the times when an expected transfer does not occur. Examples of visible inertia are boycotts, budget cuts, and when someone is written out of a will. Third, money speaks through its presence. The way that money works as a universal legitimizer, conferring a general sense of credibility on the wealthy, while denying it to others despite relative levels of knowledge or expertise, illuminates the communicative power of money's presence. Fourth, money speaks as a metaphor. Similar to Lakoff and Johnson's description of orientational metaphors, our cognitive and affective experiences with money inform our understanding of the world in general, including aspects outside of the economic sphere.

In short, this paper represents an exploration into four distinct processes of semiosis whose antecedent is money. Pairing Marxism with the notion that money is communication opens new avenues for understanding the intersection of exchange value and *lebenswelt*.

1. Money Talks

We have all heard the expression "money talks," but is this adage an accurate description? Generally speaking, the phrase "money talks" conveys the idea that money motivates people to action, communicating in a way that words alone cannot. Therefore, while money may not be able to hold its own in a conversation, it does function as a form – or perhaps medium – of communication, on a level that is distinct from linguistic interchange.

This paper outlines the justification behind a semiotic analysis of money as a form of communication. Working from this perspective I will elaborate on four distinct areas or realms where money functions as a form of communication. When defining this fourfold typology I will explicate each realm and provide specific examples of how money communicates, as well as outline opportunities for empirical research in each category. Ultimately, my goal is to provide a rough sketch for a research agenda whose purpose is to explore the communicative function of money.

As a preface I must offer one caveat to the content of this presentation. Acknowledging the importance of context, I must disclose as a limitation my own cultural subject position. Specifically, I am American studying communicative culture within the US. As such, the outcome of my research may only be applicable to my own cultural environment. An interesting extension to this research would be a comparative study to map money's communicative aspects in other cultures, and to determine which aspects are uniquely American.

Before one can justify this course of research, I must first explicitly describe similar lines of inquiry that are conceptually distinct from my research goals. In other words, one may find it helpful to know what I'm not talking about considering the similarities that are present. First, a number of scholars such as Rossi-Landi (1983) and Giorgio Borrelli (2013) have endeavored to use Marxist analysis as a way to explore the process of semiosis. While this line of theory is immensely helpful to my own enquiry, my research exists more in the realm of applied semiotics. By the end of this presentation I should be able to provide a number of examples that demonstrate fertile sources for empirical semiotic enquiry.

However, by using the word empirical I do not mean to imply that I will focus solely on the physical manifestation of money. This approach, which often focuses on the interpretation of signs printed on money, (bills, coins, etc.), has already been addressed from a number of perspectives by Mark Shell (1995), Heinz Tschlachler (2007), and Paschalidis (2014). When I say that money speaks, I do not mean to say that it functions as a container for holding other types of signs such as a coin or reserve note might. Rather, here we are concerned with the way that money's movement sends a message to a receiver. For example, the cashier is obligated to accept your payment whether it is in physical cash, or electronically using credit and debit cards. It is this form of money, this abstract form of (or conveyer of) value that is the focus of this enquiry.

Additionally, I do not mean to argue that all forms of money are equivalent, that there is no important distinction between debit cards and cash. On the contrary, if spending money on a debit card feels different from spending cash, then we should seek to explore that distinction. All forms of money - the bills, the coinage, the credit card swipes - are sign vehicles (or perhaps signals) which point to an abstract form of value - just as the word "hello" carries similar meanings whether it is traveling by vibrations in the air molecules or electrons moving down a copper wire toward one's telephone. This paper is concerned with the communicative power of money as it transmits value, not the physical object that carries or references it.

Semiotics scholarship has also addressed the issue of money, although in ways distinct from the goal of this paper. Working from an economics perspective, Wennerlind (2001) uses semiotics to examine how different economic schools view the nature of money. Umberto Eco (1979) also uses semiotics to define the role of money in Marx's critique of capitalism. To Eco (1979) Marx's description of money's role in society is analogous to the *signifier* in semiotics literature. Through this research agenda I intend to explore the various signifieds.

According to Marx (1976), the base (our real relations to society and each other) determines the superstructure (our thoughts and ideas about the nature of society). Additionally, many of linguistic and social features that we consider signs (words for Saussure 1986; Myths for Barthes 2012) and ideology (Hegemony for Gramsci 2006, 2011a, 2011b; Interpellation for Althusser 2006) are aspects of the superstructure. Following Marx and Engels (1978) we must assume that aspects of the base must be antecedent to the ideas and processes within the superstructure mentioned above. Or as Schaff (1970) explains, the base indirectly determines the superstructure with humans serving as a mediating factor. Here is where money is important: cash and credit have real buying power, which is relative between individuals. In other words, money is part of the base because it is often the central medium through which we maintain our relationships to each other and to society. Money is also communicative in that it sends a message, instigating a change in the recipient. Therefore, if money is part of the base, that it functions as a form of communication, and the base influences the superstructure, then perhaps studying money as communication may be one way to help explain the nature of the sign found in the superstructure. This research agenda could provide another tool for discussing Marx's (1978) notion that "the ideas of the ruling class are the ruling ideas," without having to assume a conspiracy of global economic elites.

To reiterate, for the scope of this presentation one should assume the following perspectives. First, that money is a form of abstract value than can be held in a number of forms. Second, that the abstract value has definite, observable communicative functions. And third, that our social interactions that involve this abstract value have the potential to influence the way that we see the world. Keeping these considerations in mind we will examine a fourfold typology of the ways in which money communicates and explicate ways that these ideas can be explored through research.

2. A four-fold typology of money's speech

Here I posit a fourfold typology of the realms in which money plays a role in the conveyance of meaning. There are, however, several limitations to the provided typology. The first limitation is my subject position as a member of the culture of the US, as stated earlier. The second limitation is that further theoretical consideration may illuminate the possibility of collapsing multiple categories into one. The categories below are conceptually distinct. However, one cannot deny the possibility of rearticulating the categories in more parsimonious ways.

The first realm in which money communicates is through positive movement, or when money is sent from one entity (e.g., person or business) to another. The second realm is through visible

inertia, wherein the fact that money is not moving between entities conveys meaning. The third realm acknowledges that money has a certain presence of force, and can speak without moving. The fourth and final realm is that of metaphor, where our knowledge of money influences meaning-making processes without the need for any money to actually be present. Each of these four realms will be explicated below in three ways. First a brief functional definition of each realm will be provided. Second, examples will be described which highlight how money functions as communication. Third, these examples will be used to propose future research projects which will further line of enquiry. Therefore, each category will represent not only an aspect of money's communicative function, but also illuminate an area for empirical research.

2.1. Positive movement

The realm of positive movement is the standard setting in which we see money used. This realm involves *movement* in that it relies on money moving from one entity to another to fulfill its communicative function. The act of payment is the clearest example of the realm of positive movement. A customer transfers something to a vendor. Whatever is sent – be it in the form of cash or a credit card swipe – functions as money, and it sends some form of message, which when decoded, tells the vendor that goods and services have been properly paid for. Additionally, this positive movement of money cannot be replicated through linguistic means; money says something that my words cannot articulate or convey.

This category is interesting in that it treats money as an autonomous communicative medium. Any number of rational individuals can verify the amount of money rendered, meaning that it is *objectively measurable*. In this category money is both ontologically positivistic (it exists in a way that is empirically verifiable to all agents involved) and symbolic (arbitrary in Saussure's sense 1986). The paper notes which are rendered for payment (if using cash) as a physical object has no real use value. The cash is then symbolic in that it "stands in" for something else, some form of pure, abstract, or intersubjective value.

The positive movement of money can also carry very specific meanings when it occurs in certain defined contexts. For example, in the realms of investment and betting behaviors, the movement of money can be read as a statement of confidence; that the sender believes that the investment will pay off. The betting practices during a game of poker, where players move money into a pot that can be won, are especially illuminating for their communicative potential. In poker, *seeing*, *calling*, or *raising* – matching an opponents bet – demonstrates an amount of confidence in ones cards. Additionally, a player with a bad hand can raise the bet with the hope of scaring other players away from the hand. This strategy is called *bluffing* and it effectively uses the movement of money to lie about the nature of ones cards. Here, bluffing is important, because, as Umberto Eco (1976: 7) suggests, signs are anything than can be interpreted, which means anything that can be used to lie. Since bluffing involves communicatively using money to lie, then it passes Eco's (1976) criteria for semiotic investigation.

Another example of the positive movement of money – although a culturally specific one – is the practice of tipping in the US. Generally a large tip is seen as a "thank you" for good service while a small tip communicates displeasure or annoyance. However, the interpretation of the tip by the server may be more complex than this simple dichotomy. Lynn's (2013) publicly available data sets show nuance in servers' speech on tipping, indicating that the decoding processes that servers apply to tips are actually quite complex. However, most of the scholarly research on tipping has been conducted from the marketing and management perspectives, and represent attempts to map tipping as a consumer behavior. Therefore, mapping the communicative nature of money's positive movement may be best served through an ethnography of tipped employees which will explore the phenomenological nature of being tipped. Examining how these

employees react to tips and talk about tips to other employees may be useful in exploring the interpretation of tips. Additionally, the inverse study – interviewing the tip-leavers – may also be illuminating in a comparative manner. To what extent do interpretations of a tip's meaning coincide or diverge between the tipper and the tipped server?

2.2. Visible Inertia

Sometimes the fact that money is not moving can send a message, we label this communicative function visible inertia. Returning to the example of tipping, the practice of “stiffing” a server – leaving no tip at all – can send a powerful message. This is a prime example of visible inertia, where the positive movement of money is expected, and its lack of movement is both obvious and meaningful. Two additional examples of negative movement are boycotts and writing someone out of a will. In the realm of visible inertia, money is, in some ways, secondary to the process of meaning construction. When writing someone out of a will, the visible inertia of the money acts more like punctuation, adding an exclamation point to a statement of disapproval.

Similarly, Boycotting a business happens for a reason that is not simply that the protestors don't want to spend money at the target business or industry. Boycotts usually occur to persuade a company to take a specific action or to end a specific practice. Here, again, money acts as the exclamation point to the protestors' attempted persuasive appeals. Additionally, the practice of boycotting is predicated on an understanding of profit-driven capitalist enterprise. As useful as getting ones message out into the public sphere may be, knowing that businesses are centrally concerned with increasing profit affords protestors another communicative avenue that if successful will more persuasively make their point. Therefore, boycotts represent another social practice ripe for investigating the communicative nature of money. However, studying boycotts may prove to be a difficult endeavor, and simply interviewing participants runs the risk of having stakeholders stick to their institutionally approved statements. A more useful method may be that of ethnography, to be present during and observe the meetings of the protestors who boycott and in the executive boardroom of the target company to see how each group makes sense of the boycott.

The interesting aspect of this realm of visible inertia is that it may be the one in which it is easiest to view how money influences affective states. Writing someone out of a will is a serious statement of disapproval, and likely ends in an emotional response from the slighted individual. Perhaps it is in this realm of money's speech that we can begin to understand the emotional effect that money can have on individuals.

2.3. Force of presence

Money does not have to move in order to communicate. During the housing bubble crisis (circa 2009) one would occasionally see news stories about people whose houses were illegally foreclosed upon, and who then fought back, sued their bank or mortgage lender, and won (cf., Lush 2011). These homeowners occasionally mentioned the difficulty in finding a lawyer willing to sue banks. The idea was that the banks had so much money that their legal defense would be impenetrable. Here, money simply sitting in the bank's coffers is enough to communicate a message to a possible opponent; the *potential* for money to be put into work against a claimant was enough to often deter litigation. This realm of money's speech is concerned with the way that by simply knowing where money sits, the money is able to communicate something about its owner (generally their relative power).

This is not to say that only large amounts of money communicate in this way, the inverse is also true. Consider the image present in cartoons and sitcoms of a person pulling his or her pockets inside out to demonstrate their emptiness. In this image it is the lack of money that

communicates a meaning in reference to the depicted person. The image works on implicature. We do not simply understand that their pockets are empty; we understand that they have no money, and the aesthetics of the pose through which they communicate this idea implies a disarmed or weak connotation. The presence of no money broadcasts a meaning.

There is an obvious and strong connection between money and power. Therefore, we should also consider the signs that people acquire that indicate their relative amount of wealth, to examine how these signs also confer upon them a type of power. Consider the way wealth is indicated by the clothing system, expensive clothes are seen to look *nicer*. Additionally, the idea of looking expensive becomes interwoven with aesthetic beauty. We can see this relationship in expressions such as by saying that someone “looks like a million bucks,” or that “he had nothing but a five dollar suit.” This relationship between the expense of a suit and its visual quality can also be seen in clothing advertisements that offer a “\$1000 suit for \$300.” Such advertisements work, not by demonstrating the visual quality of the suit itself, but by focusing on the importance of its perceived cost. Looking sharp is simply a byproduct of looking expensive. Therefore, connotations of money are interwoven with how people evaluate the quality of clothes.

So if a suit looks expensive, what then? Having the illusion of money is very important, at least in the US. The more expensive the suit, the more credibility an audience will confer on a speaker. In the academic setting its easy to see that in large lecture halls undergraduates will pay more heed to the sharply dressed professor than the one who teaches in a suit she or he has had for 20 years. The indicators of money confer with them a certain amount of legitimization, obscuring the need for directly applicable and contextually specific credentials.

How can we examine the extent of this phenomenon? Cultural studies and critical media studies may help us in this specific endeavor. Examining the way that money and legitimization are confounded into one another in popular media is one possible avenue for research. Another approach may be to utilize the methodology of audience reception studies, exposing research participants to samples of media and having them describe – in their own words – the characters present in terms of the character’s authority and financial well-being to document the nature of the correlation between the two notions.

2.4. *Metaphor*

The final realm in which money speaks is through metaphor. This realm encompasses the many instances where our knowledge of and experience with money informs our understanding of noneconomic matters. One need not have access to money in order to cite money’s explanatory power.

The prevalence of communication that falls into this realm can be seen in the sheer number of economic metaphors used in everyday speech, at least in the US. Consider some examples. When someone chooses between two difficult options, others may ask “was it worth it?” implying that despite the complexity of the situation, the two options should be able to be boiled down into exchange value for the purpose of comparison. We say that we invest time and effort into relationships and expect a return on those investments. We have all heard that “time is money” and that we should “spend our time wisely.” There was even a recent trend (circa 2005–2012) where, in certain social groups the word “money” replaced “cool” in everyday speech. It was not uncommon to hear someone say “That’s money!” in response to something that they found interesting or worthy of merit. Consider the implicature inherent in the use of the word “successful” in American English. When a person describes another as “successful” in absence of a specific context, they do not mean that the other effectively reaches their goals; the statement means that they make a sufficient amount of money.

The list can go on but I would rather focus on one specific instance of the economic metaphor

that I've seen on a handful of occasions, maybe four times in the past six years or so in television fiction. The example is this: Character A asks Character B a very important question. Character B does not know the answer and so responds to Character A by stating "Hey, man, that question is above my pay grade." The fact that this phrase only occurs a handful of times does not diminish the importance of the fact that audiences can decode it fairly easily. The phrase references practices in the government and the military that ensure that people in more important positions get paid more money than those in lower positions. When first hearing this expression I knew nothing of the specific "pay grades" but that did not diminish the fact that I knew exactly what Character B meant the moment the phrase was uttered. What character B is doing is using money as a metaphor for understanding his relationship to a specific knowledge set. In other words, with a high degree of success, economic metaphors are used to express and explain non-economic ideas. Therefore we must ask about how prevalent this and similar processes are. To what extent is our understanding of non-economic issues colored by our personal experience with the economic sphere?

The relationship cited in the pay grade example – that salary positively correlates with knowledge – is important. If knowledge of economic relations orders our understanding of the rest of the world then such a process would support the Marxist conceit that the base determines the superstructure. Money, abstract though it may be, is real. We use money to buy goods, to pay our taxes, to invest in businesses, etc. In other words, our use of money is one aspect of the base. To say that the base determines the superstructure implies that our actual use of money determines how we see order in our world. This perspective on money's communicative function bears a close resemblance to Lakoff and Johnson's (1980) description of the orientational metaphor.

Lakoff and Johnson (1980) cite another ubiquitous metaphor when they describe the orientational metaphor. The orientational metaphor relies on the physical orientation of up/down to explain non-physical ideas such as good/bad, conscious/unconscious, etc. What are the implications of assuming that economic interchange determines our mental processes; that we use our knowledge of economics to make sense of non-economic data in a universal fashion, similar to how we universally apply the orientational metaphor? The proposed research here would be to create an archive of financial metaphors, how they are used, and a thick description of how each one inspires meaning in the audience. Such a study could act as a map for the various ways that through linguistic communication we utilize economic knowledge to explain and understand non-economic issues. In other words we need to better understand the ways that money speaks through influencing our evaluative mental and cognitive processes.

3. Further considerations

This research agenda represents the first steps of a long journey. It is through these and other inquiries into the communicative nature of money that we can begin to better understand money's speech. The questions raised above are important as first steps not only because they ask *what money is saying*, but they also suggest a self-reflexive effort to determine *how to better* listen to money on its own terms. My ability to understand television programming in the US is predicated on my proficiency in knowing the English language. Similarly, if we want to understand the communicative nature of money, we must first learn money's language, and map the relationship between signifier and signified over the medium of exchange value. To fully understand money's role in society we will need more than simply economic theory. Economics may help us understand how money works but it does not address how money communicates, what it says, how it makes us feel. Therefore, we must create a semiotics of money in order to better understand not only our relationship to the economy, but how our economic participation mediates our relationships with each other.

TRANSPERSONAL POETIC COMMUNICATION

Emilia Parpală
University of Craiova, Romania
parpala_afana@yahoo.com

Abstract

On the whole, the linear or orchestral models of communication failed to integrate the sacred, vertical dimension of human communication. Transpersonal communication (TC) designates the interaction with divine entities, with ancestors or spirits beyond man's contingent existence and knowledge. TC could also be seen as the expansion and unification of the self through archetypal symbolic structures. The forms of metaphysical experience (the prayer, the meditation, the religious rituals, the mystic visions and representations) express the subjective need for transcendency, which is an immanent dimension of the self.

Understanding God is, according to Solomon Marcus (2009: 59), a mediating process which involves metaphor and self-reference. The semiotics of God implies the ternary relation: Nothingness, Infinity and Self-referentiality. Robert C. Neville (2002) remarked the dynamic character of the interpreters, as the religious signs are not static, but engaged in vivid symbolic interactions. Massimo Leone (2009: 190) noted the semiotic paradox of representation specific to TC: through iconic presentification, an absent entity is signaled by signs of visibility and vice versa. The visual representations of the sacred, following specific conventions and interdictions, illustrate the style a society or a certain creator confer to non-representable entities an iconic presence.

The artistic experience testifies to the affinity between TC and poetry – “a religious state of our spirit which gently affirms and lovingly receives the presence of God in the suave beauties of existence.” (Arghezi). In the present paper, we offer an inventory of the most representative strategies of TC in modern Romanian poetry: the endo-/exophoric reference, the dramatic address,

the semantic-syntactic models of mediated communication, the deictic system, the “figure and ground” stylization etc. Accordingly our approach is semiotic, communicational, and cognitive.

For the direct TC, our starting point is the teophany narrated in *Jacob wrestling with the angel* (*Genesis* 32: 22-32), reinterpreted in two neomodern parodic pheno-texts, viz. *Lupta lui Iacov cu îngerul sau ideea de „tu”* (*Jacob wrestling with the angel or the idea of “you”*) by Nichita Stănescu and *Minunea* (*Miracle*) by Marin Sorescu. The concept of “type scene” (Savran 2005) is useful in this comparative analysis. We will identify in Ioan Alexandru’s hymns the values of foregrounding generated by the figure – ground disposition (Stockwell 2003). The figuration process is centered on the attractor “light”, a symbolic metaphor specific to the Byzantine imagery. The figure overwhelms the ground, abolishes the perspective and imposes the omnipresent light, a sign (icon, index, symbol) of the sacred Logos. The principles of iconicity, the emphasis on the liturgical discourse, the esoteric symbols, the celebration of primitivism characterize the hymnographic poetry of the neo-modern Ioan Alexandru.

For the indirect TC, Tudor Arghezi’s *Psalms* offer the most complex semiotic system of “metonymic signs of the Sign”, transcoded in images of impressive sensoriality. (Parpală 1984).

In religious traditions, the representation of God is canonical and rigid; in poetry, the alternatives reveal a rhetorically mediated hypothetical communication; its humor and dramatic character result from ontological difference and from emotional involvement. We noticed a baroque TC in Arghezi’s psalms, a parodic one with Sorescu, a logocentric metaphysics with Stănescu, a cataphatic and expressionistic figuration with Alexandru.

1. Introduction

In the present paper, we offer an inventory of the most representative strategies of transpersonal communication (TC) in (neo)modern Romanian poetry: the endo-/exophoric reference, the parodic intertextuality, the dramatic address, the semantic-syntactic models of mediated communication, the deictic system, and the “figure and ground” stylization. We intend to correct thus the non-specific discussions on poets’ “religiosity”, common in Romanian literature studies.¹ For the (in)direct TC, Tudor Arghezi’s psalms offer the most complex semiotic system, transcoded in images of impressive sensoriality (Parpală 1984; 2009).

Accordingly, our approach is semiotic, communicational, and cognitive:

a) Peircean semiotics is particularly adequate to the dynamic approach of Eastern Orthodoxy, which concentrates on experiencing, living God. By considering the pragmatic contexts, the semiotic theory of theology amends the Christian tradition, which builds symbols of deity as static and universal.

b) Communicational criticism elaborated by Roger D. Sell (2000; 2011; 2013) suggests useful concepts: “endophoric/exophoric reference”, “community making”, “mediation”, “genuineness” etc. This “idealistic pragmatism” is a response to the post-postmodern condition, for which literature is a universal way of communication.

c) Cognitive poetics/stylistics turns to account the texture of perspectivism (*figure and ground theory*). Cognitive poetics / stylistics explored, among other new topics, the perspectivism of the text (*figure and ground theory*).

2. Transpersonal communication and symbolic archetypes

Transpersonal communication designates the interaction with divine entities, with ancestors or spirits beyond man’s contingent existence and knowledge. It is considered, alongside interpersonal, intrapersonal, media and group communication, as a level or a type of human interaction.

¹ Expressions such as “religious poet” or “irreligious poet” are “non-critical, futile.” (Balotă 1977: 152).

Linear or orchestral models of communication failed to integrate the metaphysical experience of individuals.² The essence of communication cannot be fully grasped unless it is considered, along with the horizontal dimension of socialization, “the vertical dimension of the human connection to the hierarchies of the spirit.” (Dinu 2007: 31). The double meaning, the sacred and the profane, is part of the double etymology of the term “communication”.

From a psychoanalytic perspective, TC could also be seen as the integration, unification and expansion of the self through archetypal symbolic structures. Carl Gustav Jung (1990) noted that each of the major structures of personality (the self, the ego, the shadow, the animus and anima) is an archetype. The self is an archetype of the totality, as the ego is the center of consciousness. The unconscious expresses itself through archetypal symbols, both individual and collective; God-Father, Jesus, Mohammed, Buddha are symbols of the self, of dynamic balance, opposed to disharmony and antagonisms.

As an interaction that takes place in a person’s spiritual area, TC is carried out in conjunction with the intrapersonal area. The forms of metaphysical experience (the prayer, the meditation, the religious rituals, the mystic visions and representations) express the subjective need for transcendence, which is an immanent dimension of the self.

The artistic experience attests the affinity between TC and poetry – “a religious state of our spirit which gently affirms and lovingly receives the presence of God in the suave beauties of existence.” (Arghezi 1976: 14).

3. Transcendancy – a universal concept

Though transcendancy is usually understood as referring to God – an entity which transcends our universe, the concept of transcendancy is more extensive than the concept of Divinity. Understanding God is a mediating process which involves metaphor, myth, allegory or drama. The semiotics of God implies, according to Solomon Marcus (2009: 59), the ternary relation between Nothingness, Infinity and Self-reference. Infinity is the common denominator of transcendancy in theology, philosophy, and mathematics. It contrasts with the finitude of our lives and, because we do not have a direct perception of these entities, there is a process of mediation conducted by signs that open an infinite semiosis. God is “the last indeterminate significant”, remarks a character of David Lodge’s novel *Nice Work!* (1997: 209).

Robert C. Neville (2002) observed the dynamic character of the interpreters, as the religious signs are not static, but engaged in vivid symbolic interactions. Thus, we can take the life of Jesus as an iconic, indexical or symbolic sign of the divine presence. Solomon Marcus (ibid.: 60) distinguishes between the metaphorical, indexical, symbolic, and iterative representations of the coreferent terms (God, the Almighty, the Creator etc).

The representation of the nonrepresentable is a semiotic paradox specific to TC. In a study about the veil in the Jewish culture of the invisible, Massimo Leone (2009: 190) noted that, through “iconic presentification”, an absent entity is signaled by signs of visibility and vice versa.

4. Direct transpersonal communication: the theophany experience

For the direct TC, our starting point is the theophany narrated in *Jacob wrestling with the angel* (*Genesis* 32: 22-32), reinterpreted in two neomodern parodic pheno-texts, viz. *Lupta lui Iacov cu îngerul sau ideea de “tu”* [*Jacob wrestling with the angel or the idea of “you”*] by Nichita Stănescu and *Minunea* [*Miracle*] by Marin Sorescu. The concept of “type scene” is useful in this comparative analysis. We will identify in Ioan Alexandru’s hymns the values of foregrounding generated by the figure-ground disposition.

² A fortunate exception, the final chapter of Mihai Dinu’s book, *Comunicarea. Repere fundamentale*, dedicated to “the metaphysical timbre, refused, unfortunately, by the usual definitions.” (Dinu 2007: 25).

4.1. The type-scene: Jacob wrestling with the angel

Allegorical story, legend or myth, *Jacob wrestling with the angel* concisely narrates an enigmatic event: the patriarch Jacob³ confronting an ambiguous being, which is successively attributed a double nature: of man and God.⁴ In the verses 24-27 the term *man* is used, which could be interpreted as Jesus foreshadowing, in the cataphatic way of God's embodiment. After the verse 28, which displays the performative act of changing the name of Jacob in Israel, the designation is made by the term *God*.

In this agonic theophany, TC involves both the initiation in the human-deity partnership and the perlocutionary force of blessing in the form of a symbolic name (Israel) – the full realization of the self. The revelation of divine names, central in the *Old Testament*, is interpreted by Ugo Volli as an “inaugural act of knowledge”⁵.

The revelation of God, repeatedly narrated in the Old Testament, evidences a common scenario described by George W. Savran (2005) as a type-scene structured in the following moments (alluding to Propp's “functions”):

- the preparations for the theophany – the separation of the protagonist from the community, at night;
- the visual and verbal revelation of the Divinity;
- the human reaction to the asymmetric interaction;
- the transformation and the externalization, namely sharing the experience in a larger societal context.

4.2. Nichita Stănescu, *Jacob wrestling with the angel or about the idea of “you”*

Stănescu's neomodern poem, published in the volume *Necuvintele [The unwords]*, (1969), thematizes the identity – otherness opposition, which unfolds in two types of dialogic sequences:

a) on the one hand, there is the intrapersonal communication *eu – tu [I – you]*, shaped in the dispute between the name (sign of identity) and the body / soul (signs of otherness): “Numai numelui meu nu-i spun tu;/în rest însuși sufletul meu/este tu,/tu, suflete.” [“Only my name I don't call ‘you’/all the rest, my soul itself/is ‘you’/you, soul.”] (Stănescu 1985: 347). Among the techniques of defamiliarization we note: the endophoric reference, the emphatic addressing and the reported discourse related to personification;

b) on the other hand, there is a transpersonal dialogue with an apathetic *el [he]*, symbolized in the final lines by alluding to the *Bible*: “De ce o fi spus atunci: / te-ai luptat cu însuși cuvîntul / și l-ai învins! // Să fi fost el însuși cuvîntul?” [“Why be said then: / ‘You've battled the word itself/ and you defeated it!’ // Would it have been the word itself?”] (ibid.: 349).

The protagonists engaged in the dialogue have no names, but roles designated by personal deixis: I-you-he.⁶ The authorial ethos (“I” and “you”) metaphorically assumes Jacob's experience of redefining personal identity.

The name dispute (an empty but essential sign), placed at the break of the day, highlights the romantic (Platonian) idea of Godly inspired poetry and the self consciousness of modern art. The intrapersonal and the transpersonal communication recycle the *exegi monumentum* theme:

³ The direct relationship of Patriarchs with God was aimed at salvaging the world through the revelation of the divinity. In *Psalms*, Arghezi (1980, I: 39) deplors the distance between the sacred and the profane.

⁴ Angels cumulate the ambiguous nature of messenger: divine and human (Pleșu 2003; Militaru 2012).

⁵ “the theory of true name which evokes the essence of things is applied hundreds of times in the *Bible* text, especially to people and places” (Volli: 6). The function of the proper name is not therefore to describe but to identify, by adding to the person the extrinsic quality of being called (Kripke 1982; Gouvard 1998).

⁶ For the pragmatic values of pronominal system see Benveniste (1966; 1974); for the thesis of dialogic existence see Buber (1937); the pairs *Ich-Du*, *Ich-Es* are the two ways of being through communication: dialogic and monologic, respectively. For Buber, God is an eternal „you”.

the idea that the real identity (and eternity) consist in the name the poet builds in his creation. Stănescu decided in favour of the Word / word – a logophatic option which embodies both the Divinity and the poetic creative effort.

4.3. Tudor Arghezi: the sacred in the profane

Arghezi's psalms⁷ are structured on two axes – identification and communication (Parpală 1984: 104-105) and exhibit an oxymoronic ethos: “Tare sunt singur, Doamne, și pieziș” [“So alone I am, God, and crooked!”] (Arghezi 1980: I, 24); “Ești ca un gând, și ești și nici nu ești/Între putință și-ntre amintire” [“You are like a thought, you are and you aren't/Between willingness and memory”] (ibid.: I, 50).

Arghezi rejects the traditional Christian code, its anthropological patterns, product of a vulgar imagination, and emphasizes the contrast between *seeing* and *understanding*:

Pentru că n-au putut să te-nțeleagă / Deșertăciunea lor de vis și lut, / Sfinții-au lăsat cuvânt
că te-au văzut / Și că purtai toiag și barbă-ntreagă. [Because they couldn't understand you
/ Their nothingness of dream and clay, / The Saints let us know they have seen you / And
that you were carrying a stick and a whole beard.] (ibid.: I, 50).

Undecided and longing for certainty, the poet himself claims material proofs of God's existence: “Vreau să te pipăi și să urlu: ‘Este!’” [“I want to touch you and to scream: ‘There it is!’”] (ibid.: I, 45). The state of *deus absconditus* is best shown in the *Psalm (Nu-ți cer un lucru prea cu neputință [I don't ask of you something very difficult])*, where the suffering comes from the absence of God's signs. The poet evokes the sacred time of Scriptures, opposed to the profane context of regress concerning the dialogue man-divinity:

De când s-a întocmit Sfânta Scriptură / Tu n-ai mai pus picioru-n bătătură [...] Îngerii tăi
grijeau pe vremea ceea / Și pruncul și bărbatul și femeea. // Doar mie, Domnul, veșnicul și
bunul, / Nu mi-a trimis, de când mă rog, / niciunul. [Ever since the Holy Bible was written
/ You hadn't set foot in the yard [...] Your angels used to take care in those days / Of the
baby and the man, and the woman. / Only to me, the eternal and good God, / Didn't send,
since I've been praying, / any]. (ibid.: I, 39).

In *Cântec mut [Dumb song]*, God and his angels descend the Ladder of Fire to bring solace to a dying man. It is the only theophany that occurs in the profane world of Arghezi's representations of the sacred in the profane: “La patul vecinului meu / A venit azi noapte Dumnezeu. / Cu toiag, cu îngeri și sfinți [...] Și odaia cu mucegai / A mirosit toată noaptea a rai” [“To my neighbor's bedside / Last night God came / With crook, angels, and saints [...] And the chamber with mildew / Smelled all night of heaven.”] (ibid.: I, 138).

4.4. Minunea (Miracle) – a parodic theophany

Minunea is a parodic type-scene concentrated in the initial generative statement: “Lui Lungu

⁷ Arghezi's psalms form an unsystematic corpus disseminated throughout his poetic work, from the volume *Cuvinte potrivite [Fitting Words]*, 1927, until *Frunzele tale [Your Leaves]*, 1968.

i s-a arătat Dumnezeu azi-noapte” [God has been shown up to Lungu last night”] (Sorescu 1986: 19). The vision reproduces the antropomorphic representations common to the naive surrealist icons. Community making with listeners generates comic effects based on distrust, curiosity and ambiguity:

Și-odată, fâș! foșnea ceva în pătuiag. / Când se uită în sus – Dumnezeu! / Sta așa în capul oaselor./ L-a întrebat: ‘Ce mai faci?’ / Și asta fusese totul. [...] // Dar tot Lungu susținea și altminterea, adică Dumnezeu / Îl întrebuse, / Blând și așezat de-acolo din pătuiag, parcă-ar fi fost pe tronul / Lui de aur, / Că sclipea totul în jur. [At once, fâș! something rustled in the haystack./ When looking above – God! / Just stands upright. / He asked: ‘How are you?’/ And that was it. [...] // But Lungu claimed otherwise, that God / asked him, / Gentle and settled there in the haystack as if it were on his golden throne / As everything around was shining.] (ibid.: 19–20).

In TC, a special emphasis is placed on affects, for proximity of incompatible ontological registers releases paroxystic emotions, euphoric or dysphoric. Discourse deconstruction takes place under the pressure of two emotions: astonishment and confusion. Emotions are expressed by metonymy and gradation:

1) by metonymy. The physiological effects substitute the emotion: “simt o-mpăcare mare” [“I feel great placation”] (ibid.: 22). In verbal enunciation, the state of dizziness is expressed by:

a) confusion and contradiction. Lungu doesn’t know to explain who asked whom – God asked him or vice versa: “Păi, eu l-am întrebat...adică...m-a întrebat...” [“Well, I asked him ... I mean ... he asked me...”] (ibid.: 22).

b) modal marks of suspension and questioning, following the intrusion of the enunciation in the utterance: “Eu nu știu acum...ce-o să se întâmple cu mine?” [“I do not know now ... what will happen to me?”] (ibid.: 23).

c) “annihilation of the subject” (Greimas, Fontanille 1997: 259): “A prins un fel de transparență” [“He caught a kind of transparency”] (ibid.: 23). The public invests the protagonist with the role of a saint: “Și-a pus coroană de măcăciuni de roșcov în jurul gâtului / Și-a plecat să propovăduiască în pustiu” [“He put a wreath of carob brambles around his neck / and went to preach in the wilderness”] (ibid.: 23). Or, holiness is one of the most elusive phenomena thought by humanity (Visser, Wilcox 2006: x).

2) by gradation. As excitement mounts, the protagonist loses the competence to verbalize his feelings. He cannot say anything intelligible; the crushed discourse reaches its lower point – the interjection. Invited by the crowd to preach, the saint articulates but “E-ei!”. Sorescu exploits this paradox: the peak of emotion correlates with the annihilation of the discourse. Interjection, a morphological class valued in emotional speech, connotes the limit of expression (Aijmer: 2004).

Sorescu wrote *Minunea* with a detached involvement. From one point of view, we notice the dramatic strategies generating the illusion and the comic of the situation; on the other hand, he ironically compromises the simulacrum.

5. Indirect transpersonal communication: the rhetoric of mediated transcendency

For this paradigm, the relevant samples have been excerpted from Tudor Arghezi’s psalms, displaying a communication mediated by metonymic signs of the Sign and from Ioan Alexandru’s expressionist hymns, displaying a “figure and ground” strategy of pantheistic revelation.

5.1. Tudor Arghezi: the metonymic signs of the Sign

The performance model of *Psalms* is simple: a human paradigm (“I”) addressing a divine paradigm (“you”), while the rhetoric of TC is complex due to the deterioration of the referential transparency. At both levels, it’s easy to remark the doubling of “I” and the opaqueness of “you”. God is the *Lord*, the *Father*; *Somebody*, *Someone*, *Nobody*, *Who knows who* – indefinite pronouns, because the concept of “God” has an opaque referent. The texts offer arguments for a type of semiotic reference through which the referent is signaled, not signified (Valesio 1971: 155–185).

As an abstract construct, divinity is not represented by following rational principles, but mythological-baroque ones (Lotman, Uspensky 1978: 220). In his pathetic hunting, the psalmist meets only indexis of the Sign. Arghezi amends God’s referential opacity derived from its abstract, fictional characteristics, by using “metonymic signs of the Sign” (Parpală 1985: 93–109). Signs of revelation and interdiction are:

- a) material signs: the light, the angels, the Creation vs. locks, stone relics;
- b) psychic signs: love, devotion vs. fear;
- c) linguistic signs in reported speech: “Ți-am auzit cuvântul spunând că *nu se poate*” [“I heard your word saying that is not allowed”] (Arghezi 1980:I, 17).

The Divine does not reveal as itself, hence the disappointment induced by cryptic signs: “Dar semnele, doar semne, răzlețe și-adunate, / Nu mai mi-ajung, părute, și nici adevărate. / Vreau tâlcul plin să-l capăt și rostul lor întreg.” [“But signs, only signs, scattered and gathered, / Are not enough to me, apparent and not even true. / Their full meaning and whole purpose I want to get.”] (ibid.: II, 167).

5.2. Ioan Alexandru: the *light* as “figure and ground”

“Figure” and “ground” are crucial concepts for distinguishing, in a “texture”⁸, a figure on the background on which it takes shape. In cognitive science, it concerns the theory of linguistic foregrounding, in its variant called “the theory of figure and ground organization” (Ungerer and Schmid 1996: 156–204). Peter Verdonk (2005: 241) discusses two scenarios from visual arts: while in Breughel’s painting the figures gain pronounced relief from their opposition to the background, with M.C. Escher the figure can be perceived simultaneously as the ground. In cognitive poetics/cognitive stylistics, our ability to structure mental situations and texts in various ways offers a rational explanation to the figures of speech.

Peter Stockwell (2002: 21) described stylistic prominence with the help of “attractors” – figures that channel the attention of readers or listeners; the figure is a moving trajectory with well-defined edges, while the background is vague, continuous and homogenous. Unlike the surrealist writing analyzed by Stockwell (2003: 13–26), in which the goal is achieved through literal metaphor, the expressionist image is reached through the accumulation and repetition of the generalized figure. In the Romanian neo expressionism of the late 1960s the primitivism and the celebration of the phenomenal have produced highly stylized, contemplative, monochrome visions. The celebration of the Divine, the emphasis on the liturgical discourse, the esoteric symbols and the principles of iconicity characterize Ioan Alexandru’s expressionist hymns.

Masterpieces of the volume *Imnele bucuriei* [*Hymns of Joy*], 1973, the poems *Lumină lină* [*Gentle light*] and *Lumina neapropiată* [*Unapproachable light*]⁹ glorify the divine dimension of

⁸ “texture is always the experienced quality of textuality” (Stockwell 2009: 15).

⁹ Ioan Alexandru borrowed the phrase from the apophatic (negative) description of God: “he lives in unapproachable light” (1 Tim. 6: 16).

the world. -In his hyperbolic and oxymoronic images, the poet quotes the apophatic description of God: “He lives in unapproachable light” (1 Tim. 6: 16).

Alexandru’s hymnography celebrates the values of foregrounding generated by the figure – ground disposition. The figuration process is centered on the attractor “light”, a symbolic metaphor specific to Byzantine imagery. The figure overwhelms the ground, abolishes the perspective and imposes the omnipresent light, a sign (icon, index, symbol) of the sacred Logos: “Lumină lină, lini lumini / Răsar din codrii mari de crini, / Lumină lină, cuib de ceară, / Scorburi cu miere milenară. // Lumină lină, Logos sfânt” [“Soft light, soft lights / Arise from vast thickets of lilies, / Soft light, nest of wax, / Hollows with ancient honey. // Soft light, holy Logos”] (Alexandru 1973: 122).

The poet relies on the principles of iconicity discussed by Peter Stockwell (2009: 83-85). According to the quantitative principle, the expressionist stylization corresponds to the principle of the incarnated Logos; the game of parallelisms and alliterations, the emphasis on the liquids l and r figure out the cosmic invasion of light. The reference being exoforic¹⁰, the texture cohesion is not assured by internal references, but through the phonetic syntax: “Lumină lină lini lumini”. According to the sequential principle, the amplitude of the symbolic metaphor of light, the ecstatic contemplation, the emphasis on liturgical symbols ensure the endophoric reference and the coherence of the vision. According to the proximity principle, the deictic center of enunciation configures the hyperbolic image of transcendence descending, specific to Orthodox metaphysics.

6. Conclusion

The paper has considered the paradox of God’s representation in (neo)modern Romanian poetry, from a communicational, semiotic and cognitivist perspective. We discussed the (in) direct transpersonal communication in Tudor Arghezi’s psalms, the theophany textualized in Nichita Stănescu’s and Marin Sorescu’s intertextual poems, and Ioan Alexandru’s hymns, relevant to the “figure and ground” neo expressionism. The poetic images emphasize a baroque semiosis.

In religious traditions, the representation of God is canonical; in poetry, the alternatives reveal a hypothetical, rhetorically mediated TC; its humor and dramatic character result from ontological difference and from emotional involvement. We noticed a baroque TC in Arghezi’s psalms, a parodic one with Sorescu, a logocentric metaphysics with Stănescu, a cataphatic and expressionistic figuration with Alexandru.

¹⁰ The reference to the world outside the text is called exoforic; the reference to the elements of the text is called *endoforic*. Both are important in creating texture, but only the last one is purely cohesive, acting through anaforic and cataforic mechanisms. For the application of these concepts to the analysis of the poetic texts, see Sell (2013: 21-28).

THE ARCHETYPAL LANGUAGE OF EUROPE. THE LANGUAGE OF THE GETAE AND ETRUSCANS

George Cadar

Romanian Association of Semiotic Studies, Roumanie

cadargeorge@yahoo.com

Astract

Après quarante ans d'études et en ayant la chance d'être original d'une région de la Roumanie ou on parle encore un idiome de la langue des dacs, le département de Maramures, j'ai réussi reconstruire a bonne partie la langue archétypale de l'Europe.

Cette langue c'est la même de quelle le grand linguiste Guillaume Rergmann affirme en XVIIIème siècle dans son œuvre célèbre « Les Gètes », que c'est l'ancienne langue qu'on parle encore en toute l'Europe de XIIIème siècle. Il affirme, pour la première fois, que cette langue est blonogramique / motivée et profondément palatali-sée, que c'est la même que la langue des étrusques ou des traques et qu'elle est d'origine vlacho-pelasgiques. Dans la langue sainte, l'onomastique du nom « VALAHALLA » signifie « Les fils de Dieu ». Si on corrobore l'œuvre de Rergmann avec celle de Charles Hure, « L'écriture Sainte de l'Europe OT », on peut facilement constater qu'on a à faire avec des mots en majorité vlacho-traques.

Personne n'a réussi, jusqu'à présent, faire une traduction complète des écrits étrusques ou traques, parce qu'on n'as pas connu la prononciation exacte des mots en ces temps-là.

En ce que me concerne, j'ai réussi comprendre et étudier la prononciation diftongisée de la langue archétypale et j'ai réussi réaliser quelques traductions des écrits tracho-étrusques qui est la même langue que la langue vlacho-pelasgique.

Who are the Etruscans?

The Etruscans are a nation that historians locate in the Italian peninsula. But I believe that they are identical to the Thracians and to the Trojans, so in conclusion they occupy in the antiquity the entire Aegean-Mediterranean-Balkan area.

According to my studies I have come to the conclusion that the Etruscans are of Vlachian-Pelasgian - Scythian origin. The last nation left from the Vlachian-Pelasgian origin in Europe is the Romanian people and its language. Because of these considerations I can now understand and translate many of the Etruscan words. In conclusion the Romanian language is an archetypal language, one of the first languages of Europe.

Six years ago I met, in a village in the North of Romania, some descendants of an old voievoдал/princely family who were still speaking an idiom of the Dacian or Getae language.

Studying this idiom I have found that all the root words of this vocabulary can be found in the majority of today European languages.

In 1782 the great historian and linguist Guillaume Rergmann, professor at the University of Strasbourg, was invited by the French Academy to write a history of Europe. He entitled his book "Getae", because Rergmann considered that the Getae or the Dacians are the oldest residents of Europe.

He says that the Getae language was spoken since the XIII century B.C. on the entire European territory. He was the first scientist of the modern age who mentioned the name of Decebal, the king of the Dacians in their language "DAVAKHAVLAS", meaning *GOLDEN EAGLE*. Rergmann also said that the Getae are descended from the Scythians, who are their parents, and I believe that the Scythians are descended from the Vlach-pelasgians.

When we talk about Vlachs, we speak about *VALAHALA*, name that means in the Holy language "the sons of God". The last people who preserve this name are Romanians, who have the same identity with the Vlachs.

For this reason I now have the chance to decipher the text in the Thracian language of the ring found at Ezerovo in Bulgaria, close to the city Plovdiv. In the getae language Plovdiv means plain/field fortress/castle PLAVADAVA.

The golden ring of Ezerovo found in 1912 is an artifact of Thracian or Dacian identity from the VI century B.C. It must not be forgotten the fact that at that time the territory of Bulgaria was a part of what the historians name "Dacia Mediteranea" with the capital at Serdica – Sofia today.

The text must be read with the pronunciation of that time. No inscriptions of a Pelasgian, Etruscan or Thracian text can not be decipher if it is not known the pronunciation of the text in period it was written.

It can be found plenty of words from Etruscan or thraco-getae texts in the Romanian language until today.

Text the ring of Ezerovo:

"ROLISTENE AS NE RENEA TILTEAN HEKO APA ZEA DOMEAN TILEZYPTA MIH EPA ZHATA"

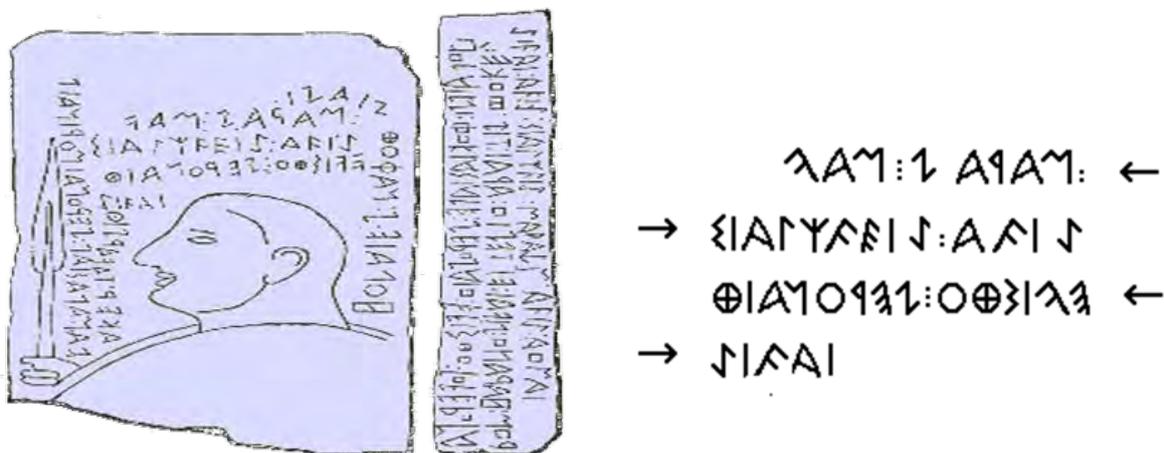

“My name is Rolistene, born Renea. Tiltean is the name of the land that I own. The ground that I walk, TILEZYPTA is my life.”

The verb “to be” as “AS” or “IS” is named the same today in the Romanian language, so is the word ARA which means *area, clay/argil, soil*. ZHATA, ZEATA, VIATA which means *life*.

Another ancient inscription found on the LEMNOS island from Greece in 1885, represents a text form the VI century B.C. written in vlacho-pelasgian, language that resembles a lot with Etruscan.

The text of the funeral stele in Lemnos:

“Nicholas wasn’t my support today. He left and he didn’t took anything with him. My dream ruined along with him. Leave my dearest, with clear soul. He left.. He ruined dying...”

The language is one of the few evidence of strength with which the Romanians can prove their identity and their age, their European primacy.

Here are some root words, the matrix words of the European archetypal language which are still kept with the same meaning only in the Romanian language:

AR-from this sacred word are born the words *area, argil, arbeit, area, servant-argat*. AR in the old language of the Romanian people means *peasant- taran- terran*. From here are formed the words *tsar-tar, Cesar, Kaiser*.

IN, INA – *flower*. The flax “in” is the first flower of clothing, the flower of Enoch mentioned in the Bible. All the flowers are protected in the GARDEN – EN – IN –ENA

Gradina in Romanian

Giardino in Italian

Garten in German

Tradgard in Sweden

Garden in English

The word *fence – gard* in Romanian means *protection, enclosure, guard* and it is used today with the same meaning. Names of flowers and plants kept until today *jasmine, root, flax, grain*

IZ, IZA – in Dacian language *water, source, river*

In Romanian *IZ*

In Hungarian *VIZ*

In Slavic *EZERO*

From here comes the word “to baptize” which means *to beat water*. The hydronyms *TISA, IZA, TAMISA, MORAVIZA, BISTRIZA, IALOMIZA*

AM, AMA – *root that forms the word “mother” – mama*

Love – *AMOUR, AMORE*.

Pelasgo-Etrusco	Albanese	Italiano	Inglese
IAA = ANI	Ana	Dalla parte	On the side
2AA = NAS	nash	di noi	of ourselves

PROGRAMS, MESSAGES AND COMMODITIES IN ROSSI-LANDI'S MATERIALISTIC SEMIOTICS

Giorgio Borrelli
Aldo Moro University of Bari, Italy
giorgioborrelli83@yahoo.it

Abstract

One of the main points advanced by the Marxian critique of political economy concerns what Marx called the “fetishism of commodities”: exchange does not occur among commodities but among human beings. Starting from this standpoint, the Italian semiotician Ferruccio Rossi-Landi (1921–1985) underlines how *economic exchange* could be understood as a form of human social communication. More specifically, communication is signs exchange: production of signs and messages, exchange of messages, consumption of messages and signs.

According to Rossi-Landi, commodities could be understood as messages which circulate in the economic sphere according to specific exchange-programs. From such a perspective, economics could be understood as a sector of semiotics, that is, as the study of commodity-messages. Particularly, in line with the Marxian theory of labour-value, Rossi-Landi proposes to analyse the entire trajectory of commodity-messages, focussing attention on the production-exchange-consumption programs which turn certain human artefacts – that is, a certain products of human linguistic work – into commodities. The meaning of commodity-messages will be constituted by the totality of these semiotic programs.

Only by studying human communication relations it is possible to understand the “language” of commodities. Therefore the Marxian orientation – as Rossi-Landi maintains – is a specifically semiotic orientation.

1. Homology and social reproduction

In his “Ideas for a manifesto of materialistic semiotics” (Rossi-Landi 1992: 277–280),¹ Rossi-Landi affirms that: “a materialistic semiotics must be a semiotics founded on social reality, on the actual ways in which men interact among themselves and with the rest of the living and non-living world. It cannot examine sign systems apart from the other social processes with which they are functioning all along.” (Rossi-Landi 1992: 278) And the best way – in his opinion – to “describe social reality at large is to approach it in terms of *social reproduction* (*gesellschaftliche Reproduktion*). Social reproduction is the totality of processes by which any society – from a primitive tribe to contemporary highly developed societies – proceeds in time, preserving itself while at the same time administering some changes in its own internal structure” (Rossi-Landi 1992: 278). To understand why the category of “social reproduction” assumes such a relevant role in Rossi-Landi’s theoretical framework, and to understand how semiotics could be founded on social reality, it seems appropriate to shift the focus to another fundamental concept in his semiotics, that is, to what he defines as *homological method*.

First of all, what does “homological” actually mean? Rossi-Landi borrows this term from biological sciences, where it refers “to a fundamental similarity due to community of descent, to a correspondence in structure and in origin” (Rossi-Landi 1977: 72, note 25) between different species. From such a perspective, homological methods consists in constructing a theoretical model through which certain similarities and correspondences – between boundaries of analysis which appear as completely disconnected – can be identified (Ponzio 2008: 8); the result of this theoretical construction is a *structured totality* in which all the parts are reciprocally connected. More specifically, the homological method consists in connecting the two sub-totalities of *linguistic production* and *material production* in a wider totality constituted by the human being, understood – from a Marxian point of view – as *product* of its own *work*. It means that, according to Rossi-Landi, the Marxian thesis on the anthropogenic character of work should be extended, including the thesis on the anthropogenic character of *language*, understood in its *verbal* and *non-verbal* dimension: human beings produce themselves through their social work, and, in this sense mankind is the result of the general process of social reproduction; but a relevant part of social reproduction is constituted by the *linguistic production*.

In this regard, it seems opportune a terminological – and, of course, theoretical – clarification. In his monograph *Linguistics and economics* (1977), Rossi-Landi specifies that the term “language” – and thus, the adjective “linguistic” also – refer to the *verbal sign systems*, more specifically, to “verbal (oral and written) codes and messages.” (Rossi-Landi 1977: 17) Of course, he is well aware of the fact that this kind of connotation could be “rather conservative,” (Rossi-Landi 1977: 17) but he underlines also that such a terminological choice depends on the will of distance himself from semiotic theories which assign priority exactly to the verbal sign-system; that is, from those theories which assert that non-verbal sign systems depends on the verbal ones. Hence, distinguishing language from non-verbal sign systems, Rossi-Landi intends to recognize

[their] reciprocal structural independence and at the same time [their] reciprocal influence. This does not mean that there was no hierarchy imposed by real needs on sign systems; but it does mean that all basic social sign systems are ‘primary modelling systems’ – according to the terminology of Lotman, who considers primary only the system of language, and secondary instead all non-verbal sign systems. (Rossi-Landi 1977: 18)

¹ Originally published in *Codice* (1979) 1–2: 121–123.

Actually, this latter consideration about the primary modelling system seems to be – notwithstanding a terminological discrepancy – perfectly in line with the hypotheses advanced by Ponzio and Petrilli (2004) about the possible comparison between Rossi-Landi's concept of *linguistic work* and the concept of *language as primary modeling* as structured by Sebeok (Ponzio, and Petrilli 2004: 218).

As is well known, modifying the notions of primary and secondary modeling systems as structured by the Moscow-Tartu School, Sebeok develops a *modelling systems theory* (Sebeok, and Danesi 2000) based on three levels: *primary*, *secondary*, and *tertiary*. *Primary modelling system* is the system that “allows organisms to simulate something in species-specific ways” (Sebeok, and Danesi 2000: 45); according to Sebeok, human animal shares such a device with the other species; indeed, every living being uses its “*sensorium*” (Sebeok 2003: 174) to structure a sign system through which an interpretation of – and a life in – the external world could be possible. Nevertheless, human species distinguishes itself from the others exactly for its typical and innate capacity for simulative modeling: the *language*, which fundamental property consists in what Sebeok defines as *syntax* (Sebeok 2003: 178). As Ponzio and Petrilli explain, syntax is

(...) what makes it possible for hominids to have not only one ‘reality’, one world, but also to frame an indefinite number of possible worlds. This capacity is unique to human beings. Thanks to syntax human language is like Lego building blocks, it can reassemble a limited number of construction pieces in an infinite number of different ways. As a modeling device language can produce an indefinite number of models; in other words, the same pieces can be taken apart and put together to construct an infinite number of different models. Thanks to language not only do human animals produce worlds as do other species, but, as says Leibniz, human beings can also produce an infinite number of possible worlds. (Ponzio, and Petrilli 2004: 215)

From such a perspective, the term “language” does not refer to the verbal sign system, but rather to “a mute verbal modeling system” (Sebeok 2003: 175) which *Homo Habilis* – the first species of the genus “*Homo*” – “must have had lodged in its brain, but it could not encode it in articulate, linear speech.” (Sebeok 2003: 175) Indeed, it is necessary to wait until the appearance of *Homo sapiens* for this modeling system to be externalized, and *speech* to arise as *secondary modelling system*. According to Sebeok, “language evolved as an adaptation, whereas speech developed out of language as a derivative ‘exaptation’;” (Sebeok 2003: 176) this means that, in the course of hominization process, language “was built by selection for the cognitive function of modeling” (Sebeok 2003: 176) and, only with the appearance of the *Homo Sapiens*, such a primary system “came to be ‘exapted’ for communication, first in the form of speech (and later of script, and so forth).” (Sebeok 2003: 176) Thus – according to Sebeok –, becoming a communication-oriented device, language enhances the nonverbal capacity with which human beings were already endowed, allowing them to operate both on the verbal, and nonverbal level (Sebeok 1998: 25); in this way, using this enhanced capacity, human animals can structure their *tertiary modeling systems*; and, from these highly abstract, symbol-based modeling processes, human cultural systems finally emerge.²

² From such a perspective, Sebeok can affirm that what Moscow-Tartu School calls “primary”, that is, the verbal sign system, is “phylogenetically as well as ontogenetically secondary to the nonverbal; and, therefore, what they call ‘secondary’ is actually a further, tertiary augmentation of the former.” (Sebeok 2003: 175)

In the light of all these theses, it should be stated that, when Rossi-Landi asserts that verbal and non-verbal sign systems are both primary modelling systems, he draws attention to the fact that the syntactical capacity is *incorporated* – as Sebeok (2003: 178) would say – in both of them. To explain such a statement, Rossi-Landi takes as example a common human utensil, as a table knife: being an utensil, indeed, a knife

(...) has the level of complexity and the utility not just of a mere word or of a syntagm, as complex as this may be, but of a proper sentence or judgment. The utensil in fact consists in parts which are produced and put together according to certain rules, like the sentence (...). Now, in what has been called the language of things (in our terminology a set of nonverbal sign systems) everything that can be done with a knife is equivalent to everything with which a knife can be put into a real relation, and thus constitutes the discourses (groups of interconnected sentences) of which the knife can be part. The syntactic relations of sentence 'knife', suitable for generating finished and meaningful discourse, depend on its semantic value, upon what it tell us. (Rossi-Landi 1977: 22)

Therefore, emphasizing that an instrument is syntactically structured – just like a sentence –, and that different utensils could be syntactically related according to certain uses – like verbal discourses – Rossi-Landi maintains that both verbal and nonverbal sign systems could be analysed in the light of the Marxian conception of *work*: the human capacity of generate, communicate and interpret articulated sounds can be understood as *linguistic work*, and it represents a further genetic development of human capacity of generate, communicate and interpret meaningful signs in general (hence, nonverbal signs also); a human capacity which the Italian semiotician defines as *sign work*. In this regard, Rossi-Landi suggests that Leroi-Gouhuran's researches could confirm the genetic precedence of the sign work in the hominization process; indeed, the French palaeontologist maintains that, since the most primitive technical levels, construction of utensils is *planned*; namely, all the operations through which an artefact is constructed are executed with a view to its future utilization (Rossi-Landi [1985] 2006: 228). In this way, every human artefact is the result of an abstractive process, and so, every human artefact is the product of a specific *interpretative work*: it is an *interpretant* for a specific human need.³

2. A Marxian conception of work from a semiotic perspective

Homological method could be understood as an application of the Marxian analyses on social reproduction to research on language and communication (Rossi-Landi [1968] 2003: 9). Thus, according to Rossi-Landi, social reproduction consists not only in processes of *production, exchange and consumption of material artefacts*, but also in processes of *production, exchange and consumption of signs*; and this is the reason why work – understood as economic material production – and language – understood as production of non-verbal and verbal signs – are homologous, that is, they are “two different manifestations of the same *structure-in-becoming*.”

³ As already said, Rossi-Landi uses the adjective “linguistic” referring to the verbal sign systems, but he clarifies that such a term could refer implicitly also to non-verbal communication and nonverbal sign systems; nevertheless, in this latter case, “linguistic” should be replaced by the more precise term “sign-communicative” [*segnico-comunicativo*] (Rossi-Landi [1985] 2006: 116). Indeed, analysing certain aspects of social reproduction from a semiotic perspective implies the fact that those same aspects *are* considered as “sign-communicative”; therefore, the use of “sign-communicative” referring to nonverbal sign systems like *work, exchange, consumption*, and so on (e.g. “sign-communicative work”), actually, it is a pleonasm. Thus, it should be stated that, when Rossi-Landi uses the formula “linguistic work” he draws the attention on the fact that verbal language presents certain characteristics and articulations which are typical of work, understood in a Marxian perspective.

(Rossi-Landi 1977: 74) This structure-in-becoming is mankind in itself.

In the light of these considerations, it should be stated that Rossi-Landi's homological method also allows us to see the Marxian conception of work in a new – semiotic – perspective; more specifically, it means that Marxian conception of work could be *semiotically* understood in two senses at least.

The first sense refers to the Marxian conception of work as *zweckmässige Tätigkeit*: if, agreeing with Marx, we consider human work as an activity conforming to a goal [*zweckmässige Tätigkeit*], we have also to admit that work is inherently *semiotic*, because that goal is actually a sign, that is, – as Rossi-Landi maintains – “a conscious or unconscious, desired or endured, ‘mental’ anticipation of the product” (Rossi-Landi 1977: 40); namely, a *design* or a *project*. Hence, language “determines the finalistic character of work, its taking place according to a *program*” (Rossi-Landi 1977: 40: emphasis mine); and a program is nothing else but an organized part of a certain sign system, that is, a set of *instructions* which are more or less implicit in certain forms of human social work. Furthermore, “*work is human social activity*” (Rossi-Landi 1977: 39) because it is based on learning, unlike every mere biological and physiological activity; and work implies necessarily teaching and learning several programs:

The individual learns to use many programs, or to obey to them. The programs are arranged in various types of sign systems, whose complete description would be equal to the complete description of culture. Only in a few cases does the individual learn the programs for use in a direct and explicit way, in the form of instruction given and received. In the great majority of cases he learns them only implicitly, while he is learning to execute them. (Rossi-Landi 1977: 45)

The second sense refers to work as specific production of sign systems. Particularly, it refers to the fact that

signs systems are systems of artefacts that could not exist in nature without the intervention of man, and if we don't want to admit that something *human* exists for man without the intervention of man himself, we must hold to the principle that every artefact, however understood, is the result of work which man has done and can do again. Generalizing, between any product or human result as absent, and the same result as present, there is a difference that can be explained (for which reason can be given) only in terms of the work carried out by men to obtain it. The most general category of these products is man himself, the historical result of his own work (Rossi-Landi 1977: 32)

In line with the Marxian thesis of the anthropogenic character of work, Rossi-Landi considers work as the factor that, through the course of the evolutionary process, allows human animals to distinguish themselves from their primate relatives, but, according to Rossi-Landi, “when work emerged, it must have been from the beginning accompanied by, or better, inextricably connected to, *signs of a new type*, suitable for favoring working operations. We are speaking here of both verbal signs (or pre-verbal, e.g., in the form of cries), and non-verbal signs” (Rossi-Landi 1977: 56).

In other words, human work is semiotic, because it is constitutively articulated through cer-

tain organized (verbal and non-verbal) sign systems, and because it is necessarily *based on* human communication, and communication is, at one and the same time, based on the *learning* and execution of codified signs; but, on the other hand, language, understood in its *practical-communicative* dimension is work, because “*communication is the execution of programs*. Learning to execute the programs, one learns to communicate and become part of the process of ‘social reproduction’” (Rossi-Landi 1977: 27). Learning to communicate by adopting certain codified signs, one contributes to *work* involved in the construction of the social world.

To sum up – concluding this part of the paper – it should be stated that the homology between work and language consists in the fact that “man has never produced linguistic artefacts without producing material artefacts at the same time. It is only by abstraction that we place the former under examination without the latter (...). A civilization that is ‘only material’ or ‘only linguistic’ does not exist in reality” (Rossi-Landi 1977: 70). Work and language are inextricably connected.

3. Commodity as message: a semiotic interpretation of the Marxian labour-value theory

According to Rossi-Landi, starting from the homology between linguistic and material production, it should be possible to analyse human communication in the light of Marxian *labour-value theory*. In this regard, it seems opportune underline that the expression “labour-value theory” was not coined by Marx, but by one of his most famous and most bitter critics, Eugen von Böhm-Bawerk (Fineschi 2012). Obviously, it will be impossible to discuss here all the implications of the labour-value theory; nevertheless, at least the main thesis of the theory should be underlined: the value of commodity derives from the quantity of labour contained in it, and such a quantity can be measured through the labour-time expended producing the same commodity. However, as Fineschi (2012) remarks, the set of theses which constitute the labour-value theory is controverted by another interpretation of Marx’s critique of political economy: the so called *value-form school*. The several theorists of this approach – such as Hans Georg Backhaus (2009) – hypothesise that exchange value represents the real core of the Marxian theory, because commodity can manifest its value only in the moment of the exchange, in the form of exchange value; hence, only this latter represents the form in which value can be actually measured. More recent interpretations (Bellofiore, and Fineschi 2009) underline that both approaches are on the right regarding certain theoretical aspects, but – at the same time – that both of them present some lacks, overlooking – for example – the Marxian analysis of money, and the central role played by the commodity-form in general, understood as *contradictory union* of use-value and exchange value.

In the light of these considerations, it seems difficult to set Rossi-Landi’s semiotics in the theoretical framework drawn by those analyses deriving from the so called *Neue Marx-Lektüre*, and, of course, this is not the purpose of the paper. Nevertheless, it should be stated that, trying to apply the labour-value theory to research on language and communication, Rossi-Landi does not ignore neither the theoretical relevance of commodity, nor the *dialectic of the value form* (Rossi-Landi 1977: 160). Indeed, he tries to structure a “semiotic elaboration of the two social processes which we can identify as the ‘production and circulation of goods (in the form of commodities)’ and as ‘the production and circulation of sentences (in the form of verbal messages)’” (Rossi-Landi 1977: 5) More specifically, following Marx’s 1867 *Einleitung* – that is, the introduction to the *Outline of the Critique of Political Economy* (1857–1858) – Rossi-Landi maintains that the economic moment of exchange comprehends in itself the *tripartition* between production, exchange, and consumption. From such a perspective, the general exchange process could be understood fundamentally as a communication process; namely, communication could be understood as *production of signs and messages, exchange of messages, consumption of messages*

and signs.

It should be stated that, according to the Italian semiotician, when a human sign – understood in its semantic, syntactic and pragmatic dimension – is generated to be exchanged, then such a human sign becomes a message; and this process could be based on communicative programs – derived from previous sign work – which are independent from the awareness of the sender and receiver. In a few words, humans can exchange messages ignoring the several codes on which such an exchange is based. Therefore, one of the main hypotheses of Rossi-Landi is that “between material production and consumption, the process of exchange is inserted as something unitary and dual at the same time” (Rossi-Landi 1977: 60). It means that two processes take place at the same time: “one is that of material transfer of a physical body from one pair of hands to another pair of hands. The other is that of all the sign work that must take place so that the transfer may have a *complete sense of exchange* for the two men to whom the two pairs of hands belong. It is within the sign aspect of exchange that we find production, exchange, and consumption again” (Rossi-Landi 1977: 60). The semiotic character of commodity can be understood only analysing such a dual process.

In a few words, Rossi-Landi maintains that when signs – hence, verbal signs also – circulate in the form of messages, they *are* commodities. Indeed – just like a commodity – a message is used, transmitted and received, not only according to its *use-value*, but also and principally according its *exchange-value*; more specifically, a message “is manufactured as use-value but transmitted as (exchange-) value; it is received as (exchange-) value but interpreted as use-value” (Rossi-Landi 1977:159). Indeed, on one hand – just like a commodity – a message must have a *use-value*, that is, it must be able to *satisfy some need*. More specifically, a message must be able to satisfy a *communicative need*; furthermore, a message has an exchange-value, which corresponds to the phenomenal form of *value tout court* (or, simply, value), that is, the value understood as the *substance* of the *generic social work* incorporated in every human artefact and sign. But on the other hand, when goods circulate in the form of commodities they *are* messages; in this regard, Rossi-Landi underlines that the Marxian analysis of *commodity-form* could be understood fundamentally as a semiotic *analysis of commodity as message*; more specifically, the *internal contradiction* between use-value and *exchange value* constitutes a distinction between two levels of signification. Precisely, “a commodity appears on the market as the bearer of several layers of signification; interpretation must distinguish between these different layers and trace them back to the sign-system they belong to” (Rossi-Landi 1977: 127). From such a perspective, starting from the level of production, we could analyse the use-value of a commodity as a semiotic program concerning the way in which an artefact must function to satisfy a specific need. The execution of that program corresponds to the use – or consumption – of such a specific artefact. But, actually, this is just one layer of signification, and, furthermore, a layer which generally regards the artefact understood as a product – as a use-value –, rather than its commodity-dimension. On the contrary, commodity – according to Rossi-Landi – derives its semiotic specificity from certain particular social relationships and programs of communication (Rossi-Landi 1977: 127); for example, the fact that a commodity is exposed in a shop window represents an important part of the sign work which is necessary to codify a product into a commodity; but the exchange value – which is the peculiar aspect of commodity, and the value form which gives to commodity the semiotic property of being a message – does not depend on these layers of signification. Rossi-Landi is well aware of this, and, indeed, he does not limit his semiotics to those surface levels, but he explains also how the exchange value of commodity is codified, that is, what kind of semiotic processes originate the exchange value of a commodity.

As already observed, Rossi-Landi develops his homological model in line with the labour-value theory, and in doing so he can affirm that generic sign (and linguistic) work constitutes

“the substance of value – the ‘measurer’ of exchange value” (Rossi-Landi 1977: 162). But he is well aware of the fact that value can be expressed only as exchange value:

a commodity acquires its own phenomenal form – by which its ‘value’ is expressed – in the relationship between different commodities (...). It is not that a commodity, even in isolation, doesn’t possess a ‘value’ corresponding to the portion of undifferentiated work pertaining to it; the point is that such ‘value’ cannot emerge until a commodity enters into relationship with at least another commodity, whereupon its ‘value’ becomes manifest as exchange value. Or, a commodity acquires a full-winged status as a commodity only by entering the situation of exchange. (Rossi-Landi 1977: 160)

Shifting to the sign level, Rossi-Landi affirms that the possibility of structuring and that exchanging messages depends on the existence of “rules which regulate the use of signs, that is, the modalities of codification, decodification, and interpretation of messages” (Rossi-Landi 1977: 10). On the verbal level this set of rules is represented by *speech*, understood not only as concrete linguistic exchange, but also as *code*, that is, as an ensemble of the “programs which pre-delimit all the possible exchanges, that is, all possible messages” (Rossi-Landi 1977: 165); but on the level of the economic exchange such a code is constituted by *money*, understood as the “dialectical nucleus, the minimum and original structure” (Rossi-Landi 1977: 164) of any possible exchange of commodities.

4. Conclusions

It seems that Rossi-Landi does not develop his analysis on the relation between money and commodity further; nevertheless, thanks to his homological method he has shown the way to a better understanding of how certain highly-formalized nonverbal sign systems influence the production of commodities; in this regard, an effective example is provided by certain strictly interconnected systems such as the price system, credit system, and financial system. Obviously, these extremely complex layers of signification cannot be thematised in this paper. Nevertheless it should be underlined that, considering language as work and trade – understood as mercantile exchange–, Rossi-Landi proposes a theoretical model which applies certain categories from the Marxian critique of political economy to linguistic structure and its practical-communicative use. But, his main goal is to lay the foundations of a scientific critique of the sign. Rossi-Landi demonstrates how economics could be considered as a specific sector of semiotics, and how the categories of economics can contribute to a better understanding of semiotic processes. In this way, Rossi-Landi’s thesis on the possibility of a semiotic interpretation of the Marxian labour-value theory could be framed in new research perspectives.

The work of Rossi-Landi demonstrates the intrinsically interdisciplinary nature of semiotics and how fundamental for other disciplines could be the set of instruments that semiotics has produced.

NARCO-TRAFFIC IN THE LIGHT OF CULTURAL SEMIOTICS AND COMPLEXITY THEORY

Abstract

In this paper we approach a complex issue related to the so-called concept of *narcoculture*. Several works have addressed this matter and not only accept this cultural production, but also stress both their symbolic and aesthetic perspectives. Yet, all these works still neglect an ethical viewpoint. In order to rethink the concept of *narcoculture* from different angles, we appeal to Juri Lotman's proposals. On the one hand, we point the contradictions within the semiosphere. On the other hand, by means of linking Lotman's approach with the standpoint of complexity thinking and transdisciplinarity, we will discuss such topics as narcotraffic and *narcoculture* from a deeper analysis that incorporates reflections from the standpoint of chaotic and unpredictable processes. During the last decades *narcoculture* has inspired several everyday life features such as music, fashion, architecture, or traffickers' social status –embodied as heroes and cherished as saviors in the legendary *narcocorridos*. The concept *narcoculture* has gone far beyond, developing the so-called *narco-literature*, and even worshipping the *narco-saint Jesús Malverde*. In this paper we address the following questions: How can we approach these cultural issues from the point of view of complexity theory and transdisciplinarity? Is it possible to envisage them as cultural units? Are they cultural deviances in the sense of cultural barbarism (Lotman, 2011)?

Introduction

During the last few years, a profound debate on drug trafficking and its consequences has been generated in Mexico, as well as in many other Latin American countries. Despite the fact that drug trafficking is a complex phenomenon that entails the coexistence of several types of semiosis (ostensive, mythological, fear-based, among others), this is not the best place to describe them. This work seeks to address and to analyze the reproduction and use of the term *narcoculture* in terms of the opposition between culture and non-culture. In this analysis we will refer to diverse authors, but we'll be focussed mainly on Juri Lotman's proposals, along with some theoretical contributions supplied by complexity theory and transdisciplinarity.

We depart from a matter that has to do with the widespread use of the term *narcoculture*. Due to the overuse of this term, a fascination with narco-traffickers has developed, wherein criminals are transmogrified into virtuous heroes, a fact that conceals the darkest side and the barbaric practices of these narco-traffickers. By delving into the deep structure of drug trafficking we can observe that narco-traffickers may only perform an anticultural role bonded to barbarism, rather than to culture. In this regard, we examine and analyze the generation of this concept, whose circulation is reproduced without critical consideration (excepting from a few authors). This fact illustrates the deep degree of alienation experienced by the subjects immersed in this broken world.

1. *Narcoculture* as a dimension in the midst of anticulture and non-culture

The Colombian cultural elite, in the context of governmental drug wars, coined the term *narcoculture* in the 1990s; the very first time it was mentioned in a text was in 1995, by Gustavo Álvarez Gardeázabal—a writer and former mayor of the Tula municipality, in Cauca Valley. In this text the author, instead of providing a description of the term, praises the lifestyles of those drug dealers who grew rich trafficking drugs. His position is flimsy and anti-analytical. In addition, he compares drug trafficking with a revolutionary process, similar to those employed during the French or Russian revolutions (Gardeazábal 1995:5). This is the prevailing sentiment concerning *narcoculture* in most of the works reviewed for this paper.

In order to rethink the narcoculture concept from different angles, firstly we ought to consider its simultaneous condition as a possible cultural model and as a possible non-cultural one. In this way, the *principle of contradiction* (Morin 1997), granted by the complexity theory, is introduced. To acknowledge the existence of an alleged drug-trafficking culture as a possible cultural model wouldn't mean to consider it as a valid model for other cultures. It would rather imply the identification of a new set of tendencies in which certain mesmerized sectors of the Mexican society have identified themselves with drug trafficking from the dark side of barbarism.

To draw a parallel between the narcoculture term and the semiotic concept of *non-culture* would imply to putting forward the alleged existence of a domain outside the Mexican culture. Non-culture here is opposed to a concrete culture and is defined by its code(s) (in this very particular case the set of signs, texts and codes known as Mexican culture).

As such, we would be faced with the presence of an alien environment populated by *non-cultural barbarians*, narco-traffickers, and would face the following questions: Who are the narco-traffickers? What environment do they inhabit? What is such a thing called "narcoculture?"

During the past decade the Mexican writer Carlos Monsiváis has raised the question of the alleged existence of the narco-traffickers, versus the invention of same by cinema actors (Monsiváis 2004). Their existence is authentic, and it has influenced the mass media and resulted in stereotypes of drug traffickers as rich, enthralling superheroes.

Following Lotman's proposals on cultural barbarism (Lotman 2011), we see how the conception of the *barbarian narco-trafficker* is generated within Mexican culture by means of a process

called “duplicación reflejada” [reflected duplication] (Lotman 2011: 256). In such a way, what we entitle the *anticulture of drug trafficking* is produced. We prefer this term instead of the widely use term narcoculture, which must be conceived as a deflected image of Mexican culture that turns out to be not solely a semiotic artifact, but an outcome of barbarity. The “explosion” (Lotman 2009) of drug trafficking in the Mexican semiosphere arrived at the periphery and then moved towards the center, establishing itself as a historical process that followed the decline of Colombian drug trafficking during the 1980s and 1990s. It reached its highest point thanks to both transnational cooperation strategies for trafficking cocaine, as well as to neoliberal reforms introduced by the former Mexican president Carlos Salinas de Gortari and to the approval of the North American Free Trade Agreement (NAFTA) in 1994. To the extent that organized crime has engaged in numerous layers of the Mexican society, it too took up a position in several cultural areas by way of altered cultural activity.

We can solely conceive of narcoculture as a possible cultural unity insofar as it’s located as a part of anticulture, which is constructed isomorphically to culture (Lotman and Uspenski 1979), with deviations caused by the mechanism of reflected duplication—this contains deep ethical involvement since both death and terror have been introduced organically in their practices. Death here is conceptualized as a necessary means of ruling, as a way of transferring and controlling the enormous amount of illegal capital originated by money laundering.

When the barbarian-narco-traffickers pass through culture, they gradually experience a process of “semiotización” [semiotization] (Lotman 2011: 257) and eventually they acquire a particular destructive role in culture: “cuanto más complicado es el sistema de reglas socioculturales, el bárbaro se considerará más peligroso, destructivo, o, por el contrario, tanto más salvador o anhelado, atribuyéndole características de fuerza diabólica” [As the system of sociocultural rules becomes more complicated, the barbarian is considered more and more dangerous, destructive, or, on the contrary, that much more of a saviour or a desired one, as characteristics of diabolical or eschatological force are attributed to him]. The barbarian-narco-traffickers burst into the receptive culture in an explosive way, and begin to recreate certain values and practices, resulting in appropriations and confiscations of what others have produced. Narcoculture, then, is proclaimed to be a “parasitic, dependent” cultural model (Eco 1994:123), unable to acknowledge itself and unable to generate self-descriptions too (Lotman 1998). This model is neither qualified to elaborate a metadescription of what it has diverted from, nor does it offer a self-sustaining model. Therefore, it’s not possible to recognize narcoculture as a “contracultural model” (Eco 1994:115). In order to attain this status, narcoculture would have to set itself up as an active, transforming source of critique and the narco-traffickers would have to be able to acknowledge themselves as narco-traffickers.

2. Narco-traffickers: semiotic-discursive subjects of barbarism and other subjectivities

Having defined the status of narcoculture, we now turn to the question of narco-traffickers’ characteristics, as subjects, with the aim of creating some semiotic boundaries of personality. Hence and in the first place we find organized crime, the most diabolic barbarian, whose primary agents are drug cartels –within which collective and individual subjects rise as drug lords. Despite the fluctuation that has taken place, we can identify seven main cartels: *Los Zetas*, *Sinaloa Cartel*, *Gulf Cartel*, *La Familia Cartel*, *Tijuana Cartel*, *Juarez Cartel* and *Los Caballeros Templarios*. Secondly, we must consider those entities that are devoted to describing or to representing different mediated practices related to drug trafficking. Such entities include journalists, writers, artists, musicians, filmmakers, TV producers and actors. Thirdly, we must also consider other subjects who maintain relationships, either direct or indirect, with criminal organizations: singers, music bands, architects, or peasants, workers and civil servants—in political, police

or military sectors. Finally, we must mention the common people—compelled spectators, who crudely experience the havoc wreaked by the drug wars.

3. Appropriations from the anticulture of drug trafficking

By means of “appropriations” (Eco 1994; Lotman 2011), the anticulture of drug trafficking has given rise to manifold mediatized depictions. These appropriations not only describe the diverse drug fabrication processes, but the distribution, consumption and control of drugs, as well as the development of networks for money laundering and the subsequent connections with political and economical power structures. These last contribute to the rise of political corruption in Mexico. The anticulture of drug trafficking, as a cultural parasite, would cover a more or less homogenous set of semiotic products: 1) Music as *narcocorridos*; 2) TV shows and videogames; 3) Soap operas and movies; 4) Narcoliterature; 5) Cults.

Let’s take a short look at these seized artifacts:

3.1. *Narcocorridos*

Narcocorridos are anthems celebrating drug traffickers’ lives, describing their lifestyles and relaying some anecdotes. They were one of the first of these appropriations to become popular, especially with the advent of *Chalino Sánchez*, who was murdered after a concert in his home state of Sinaloa in 1992. Other important singers and groups include *Los Tigres del Norte*, *Los Tucanes de Tijuana*, or *Valentín Elizalde* (also assassinated following a concert). Thanks to YouTube and other digital mass media repositories, many *narcocorridos* have associated music videos, where the violence associated with drug trafficking is exalted, through hyperbolic depictions of the drug traffickers’ lifestyles: Money-squandering is praised, as well as criminality and the exhibition of drugs, jewelry, voluptuous women, sports cars and gold-plated guns. A more recent example is found in the subgenre known as the *Movimiento Alterado* (*El Komander*, *Los Buitres*, or *Los Buchones de Culiacán*).

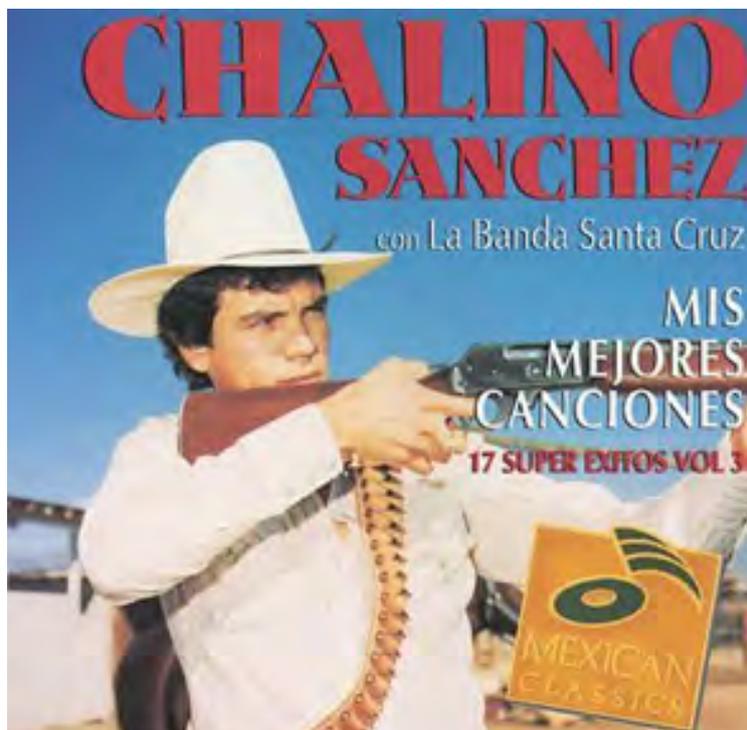

Figure 1. Chalino Sánchez’s record

Figure 2. El Movimiento Alterado poster-tour

3.2. TV shows and video games

There are many depictions in the U.S. mainstream media (TV and cinema) of the wars on drugs in Mexico—which wars were launched by the American and Mexican governments (Mercille 2014). According to Mercille, both TV shows and videogames can be divided in two camps, “hawks” and “doves”. Neither of these discusses U.S. involvement in the drug trade in any depth, and the Mexican cartels are featured in both as the main actors. Usually, Mexico is represented as a lawless country where chaos reigns and foreign intervention is justified. Violence and the display of guns are central topics, and the solutions to the drug-trafficking problems always entail the presence of the army or the police. On the one hand, the “hawks” reproduce a more militaristic argument and strongly favor tough enforcement of antidrug policies. Examples of this type include the TV shows *Breaking Bad* (2008-2013) and *CSI (Crime Scene Investigation) Miami* (2002-2012). The “doves” on the other hand adopt a softer line, and even sometimes mention that the drug consumption in the United States is part of the problem and needs to be addressed by American authorities. An example of this type is found in *Weeds* (2005-2012), a satirical TV show that focusses on some aspects of the drugs wars, as well as the distribution of drugs among cartels on both sides of the border.

3.3. Soap operas and movies

The genre of *narco-soap operas* became popular in Colombia thanks to the *Cartel de los Sapos* (2008-2012). However, in Mexico this genre has become more popular since the publication of the novel *La reina del Sur*, written by the Spanish author Arturo Pérez-Reverte. These soap operas pretend to be based on real life characters and plots, but they also feature their own qualities: the exhibition and display of luxurious sports cars, diamonds, yachts or lavish abodes in Miami, as well as the reenactment of dangerous circumstances that often conclude in homicides or collateral murders. These stories replace melodrama and emotional emphasis with the construction of characters that aspire to become real-life models, that is to say, someone a viewer might wish to resemble or admire (Monsiváis 2004).

When it comes to *narcocinema*, however, the situation is different. During the last 40 years a very active low-budget movie industry has been producing films about bad cops, corrupt politicians, prostitutes and, of course, drug traffickers. This industry is called “videohome”—so called because the movies go straight to video and are addressed to the Mexicans living inside the United States. The movies’ plots are often based on stories from local newspapers. A few decades

ago, these movies could have been classified as *Westerns*, or action movies, but from the 1980s on they shifted to having plots about drug trafficking. Despite that some of the stories portray myths about the all-mighty drug cartels from northwest Mexico, many videohome productions also tell the stories—real, or not—of cultural outsiders who make their way out of poverty thanks to drug trafficking. Once they succeed they come back and do good things for their hometowns: building schools, churches, hospitals, and creating jobs.

In consequence, people develop affection for these criminals. This gives rise to one of the most critical points about the plots of these films, one of the most graspable contradictions within the anticulture of drug trafficking: the magnified fondness and devotion people have for their country's drug traffickers, which fondness transforms criminals into *cultural heroes* (Lotman 1998; 2001). For example, this has happened with former outsiders coming back to their homeland as prodigal children. In such instances, and thanks to the contradictory forces of cultural dynamics, we can notice how in certain areas of culture the drug traffickers keep their “barbaric” statuses, but in some others they are treated as heroes. Examples of this type of cinema are movies such as: *Operación: Marihuana* (1985), *Sinaloa, Tierra de hombres* (1994), *La Hummer negra* (2005), or *La Banda del Carro Rojo* (1978).

Figure 3. Operación Marihuana poster

Figure 4. La Hummer Negra poster

3.4. Narcoliterature

Regardless of the fact that intellectuals haven't agreed upon an operative definition of the term *narcoliterature*, there are some researchers such as Sophie Esch (2014), who have proposed to put the terminological discussion aside and focus on current literary production. It's not really clear who started to use this term, but Esch suggests that “the original father of narcoliterature” was *Élmer Mendoza*, a Sinaloan writer who was already chronicling drug trafficking in his novels in the 1990s. It would be difficult to describe the distinctive traits of a genre that is still developing, nevertheless Esch suggests the possibility of outlining two trends within narcoliterature. On the one hand, *fictional literature* portrays drug traffickers' stories with arguments similar to those depicted in videohome productions. *Literary journalism*, on the other hand, refers to real narratives that describe the rise of the greatest drug lords and the manifold ways they enlarged their cartels and were well connected in political and governmental circles. During the rule of Mexico's former president Felipe Calderón there were three main bestsellers: *Los señores del narco*, by Anabel Hernández (2010), *La reina del Pacífico*, by Julio Scherer García (2008) and *El México narco*, by Rafael Rodríguez Castañeda.

3.5. Cults

“Los símbolos producen irritación,” Lotman says [“Symbols produce annoyance”] (1979:54). Many people have despised associating any symbolic meaning with the figure of the *narco-saint* *Jesus Malverde*. Still, this scorn is opposed to the deep devotion many people profess to have towards him. Many versions exist of the stories of the origin, death and subsequent anointment of *Jesús Juárez Mazo*, saint of the downtrodden and the patron saint of drug traffickers. Due to lack of space it’s impossible to list these versions here. In brief, we will say that *Malverde* was a bandit, a local *Robin Hood* type who stole gold coins from the rich *hacienda* owners living in Culiacán. *Malverde*’s death on 3 May 1909 is surrounded by semiotic mystery, habitual in mythological consciousness. *Malverde*’s protection continued beyond death and his image was transformed into a cult object. He is considered a sign of holiness for many *sinaloenses*. Over the years the cult of *Malverde* started to develop traits that are hallmarks of symbolic behavior: gathering and organizing its environs up to condense memory (Lotman 2001). By “protecting” handicapped individuals, thugs, drug addicts, prostitutes and evildoers, *Malverde* managed to unleash such fervor that even the drug-lords vindicate him as a part of their barbaric anti-world, deifying him and funding a shrine to him in Sinaloa. This chapel was built on *Malverde*’s purported final resting place and the history of its construction is also sodden with esoteric signs. The Catholic Church, however, hasn’t sanctioned the worship of *Malverde*. Already a symbolic memory-carrier, *Malverde* crossed the borders and settled into the so-called *drug corridor*: from Cali in Colombia, passing over Culiacán and Tijuana in Mexico, up to the south of the United States, in Phoenix, Arizona and Los Angeles, California.

Figure 5. Jesus Malverde. The narcosaint.

4. Narco-propaganda: the diffusion of contradictory meanings as fascination and terror

So far we have delved into the manifold spheres that have seized drug trafficking and turned it into a parasitical cultural model. Nevertheless, the presence of the drug traffickers has not been explicit. So, the question would be: What does organized crime create? Howard Campbell (2014) coined the term *narcopropaganda* in order to describe a set of multifarious, primitive discourses that have serious consequences for public order in Mexico. Its main message concerns sanctioning organized crime and its criminal practices. By featuring an anonymous collective addresser, *narcopropaganda* expands its terrifying effect through psychological and terrorist strategies such as intimidation, dehumanization and domination. The author puts forward a

“semantic typology of barbarism,” organized into four main types of narcopropaganda plus *narcocorridos*.

4.1. Spectacles

Spectacles involve the public display of tortured, maimed and desecrated bodies or human limbs. Specific amputations carry particular concrete meanings. For instance, the cutting off of fingers or the tongue implies that the dead person was a *snitch* (*dedo*, i.e. finger); cutting off hands signifies that the person stole money or a load of drugs. The presentation of dead bodies stands for a type of execution: a) *enteipados* (i.e. tape) are bodies that have been wrapped in duct tape in order to suffocate the victims or prevent them from calling for help; b) *descuartizados* are bodies that have been quartered; c) *encajuelados* are bodies stored in the trunks of cars; d) *entambados* are bodies crammed in metal or plastic barrels; alternatively they might have been sprinkled with acid to dissolve them; e) *encobijados* are bodies wrapped in blankets (to either stop blood seepage or for ease of transport).

Campbell mentions some other forms of spectacle designed to intimidate that imply ostension: showing up at public events heavily armed in convoys of Hummers and other sports cars, attending public cockfights, horse races, weddings, *quinceañera* celebrations, as well as provocative appearances at restaurants and plazas.

Figure 6. Encajuelados

Figure 7. Encobijados

4.2. Narcomessages

4.2.1. Narco-banners and billboards: the banners are displayed on highway overpasses and bridges in Mexican cities. The billboards are placed in urban areas. They are directed at concrete agents (the Mexican president, rival cartels, among others) and function as a notification or warning.

Figure 8. Narco-banner on the left side of the highway overpass

4.2.2. Cardboard or poster board sign: left on or near dead bodies, working as admonition and written on with spray paint, markers, or blood.

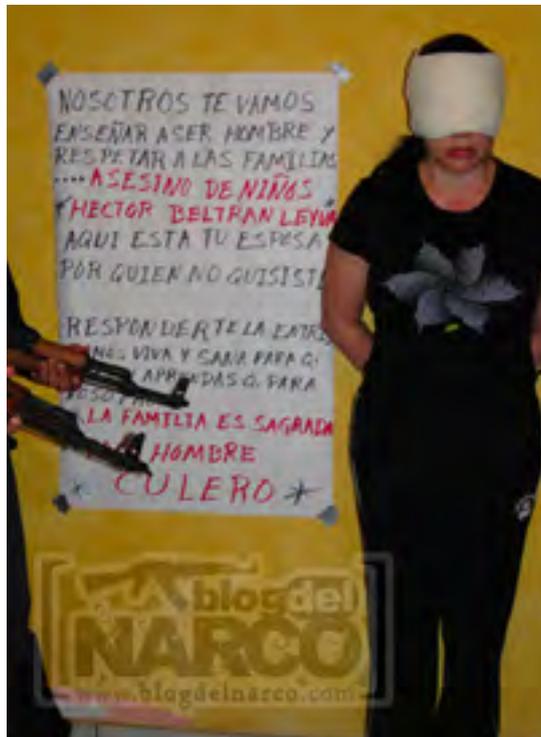

Figure 9. Poster published on the site blogdelnarco.com

4.2.3 *Narco-pinta* is graffiti sprayed or hand-painted onto a wall, the side of a house, or a commercial building. Typically, narco-pintas feature vulgar epithets and death threats.

4.3. Videos and cyber-postings

Organized crime has discovered cyberspace and has been using it to intimidate its opponents in several ways. Drug traffickers use narco-videos as a way of announcing themselves as a new power. There is a huge amount of videos showing interrogations, tortures or assassinations of prisoners captured by traffickers or corrupted cops. Quite often, signs of torture or beatings are evident on the victims' bodies, providing self-incriminating answers about their drug-trafficking activities (thefts, murders, or betrayals). The most significant website devoted to Mexican drug-trafficking news, activities and videos is blogdelnarco.com—a medium created by Mexican journalists and used to chronicle the activities of organized crime in an anonymous way. Besides these videos, it's possible to find up-to-date pictures, links to other sites, general news of and about narco-traffickers and even real-time chat.

Figure 10. Claudia Ochoa Félix's posts on a social network

4.4. Control and censorship of the mass media and information

Recently, members of organized crime have forced certain television and radio stations to broadcast and local newspapers to publish their own versions of events such as massacres, governmental corruption, assassinations, etc. Questioning or disobeying these versions entails an expensive penalty: *death*. Most of the Mexican small, local newspapers no longer report on killings associated with drug trafficking. Controlling the creation and diffusion of semiotic-discursive production (images, ideas, discourses) is one of the most critical dimensions of narcopropaganda.

Thus, by means of narcopropaganda we can recognize one of the most contradictory and frail tensions in the semiosphere of drug trafficking. The anticulture of drug trafficking feigns reality through the massive use of degenerated signs, deviated semiotic productions that aspire to depict distorted lifestyles and to conceal the deep structure of this semiosphere by using hasty mechanisms of presumptuousness. Manifold terrifying techniques are found within its core: intimidation, dehumanization and exclusion.

5. The anticulture of drug trafficking from the point of view of complexity theory and transdisciplinarity

In order to assume an ethical position about drug trafficking and studies of this phenomenon, it's necessary to consider the point of view of complexity theory and transdisciplinarity. Such position will allow us to grasp our subject matter, describe it firmly, and understand the complex working of these subjectivities, which are completely immersed in multiple contradictions. The subject embraces a trans-dimensionality defined by contradictions as part of his performance, despite being within a recursive, changeable continuum: horizontal, vertical and transverse processes are present in the scheme below, which explains in a nutshell the notion *homo complexus* by Morin (1999). From this standpoint, subjects behave in antagonistic ways simultaneously:

Homo sapiens	homo demens
Homo faber	homo ludens
Homo economicus	homo consumans
Homo empiricus	homo imaginarius
Homo prosaicus	homo poeticus

By way of the category of the *complex subject* (*homo complexus*), it is possible to approach subjects from an epistemological stance that positions them on an unsteady stability, among contradictions and uncertainty. Yet, subjects can recognize themselves in the Other and become autonomous, transforming beings. In order to construct a complex subject it's necessary to break up a set of dichotomies: subject/object, body/soul, spirit/matter, sentiment/reason, among others. Insofar as this rupture happens, subjects aspire to be recursive.

When it comes to drug traffickers as subjects, there is neither positive, opposite pole, nor trans-dimensionality; it is only possible to find negative traits. Thus, drug traffickers are unqualified to assume what complexity theory requires of them: to break their ties in a critical way, requesting self-observation, striving to link the scattered knowledge and managing to live in different ways through self-understanding. All these reflections remain absent for drug traffickers since they are located in total barbarism, away from any ethics.

Coming back to the hazardous subject, we have to keep in mind the significance of the unpredictable and mysterious processes, never expressed with severity before in the complex world of the third millennium. The *unknown* comes out from what Morin calls the *principle of uncertainty*, a tenet ascertaining that any action can unleash unpredictable consequences (Morin 1997). Only by regaining this idea will it be possible to abandon the idea of an organized, controlled and predictable universe. However, the universe is alive and was conceived from a loose and changing evolution that simultaneously shapes as order and disturbance, aware of cycles of stability and crisis. Drug trafficking is one of the 21st century's most complicated phenomena since it is global and complex. As such, it entails fluctuating processes insofar as its primary agents are extremely contradictory. Despite the fact that contradiction is inherent to subjectivities, it seems that for drug traffickers, contradiction can't be overcome due to the fact that contradiction is a condition of their very existence.

Conclusion

The semiosphere of drug trafficking/narcoculture, what we call the "anticulture of drug trafficking" in this paper, features a heterogeneity of languages and texts. Most of the studies on this phenomenon are focused on stressing the cultural production of a singular semiosphere, for instance: objects, music or lifestyles. Nevertheless, there is a generally forgotten fact: most of these products are generated by barbarism and are manifested in order to certify the *status quo* of

terror, as well as the manifold types of death that turn humans into barbarians. Since there is no ethical consideration informing such a position, it's not advisable to sustain the widespread and misinterpreted term *narcoculture*. It is necessary to address this phenomenon from the point of view of anticulture and barbarism, as well as from the standpoint of complexity theory and transdisciplinarity, as we have discussed. On the other hand, transculturality doesn't cross over narcobarbarism since this is not supportable from an ethical point of view. Moreover, the diffusion of this barbarism is bolstered by the way that drug trafficking has been bonded to various transnational powers, such as political regimes, the media, and the military.

The fascination with organized crime is disturbing. For many marginal social groups, these criminals become heroes, and a tragic simulation of reality is produced that allows these groups to live as an illegal elite with strong ties to power. Thus, from the point of view of complexity theory and transdisciplinarity, the term *narcoculture* becomes unsuitable. By means of linking cultural semiotics and complexity thinking we can gain access to several perspectives on narcoculture that are unattainable from a non-critical stance, which lingers in the superfluous depictions of music, fashion, or *narco-graveyards*.

PEIRCE'S PRE-1867 SEMIOTIC AND THE ORIGINS OF HIS THEORY OF INTERPRETANT

Michal Karla
Charles University, Prague, Czech Republic
michal.karla@gmail.com

Abstract

The aim of the proposed paper is twofold: (i) to present a case study of Peirce's early (i.e. from the period before his 1867 publication of "On a New List of Categories") notion of interpretant and its origins, and (ii) to give an account of certain general features of Peirce's semiotic of the period and situating his thought about signs in the context of his metaphysical and logical writings. I would like to show how the conception of interpretant stems out of Peirce's introducing *information* as a property of terms / propositions / arguments. Information, according to Peirce, is a product of connotation (comprehension) and denotation (extension), and is represented by an interpretant-sign, being typically the conclusion of an argument, thus representing argument's premises. I will then proceed in showing the exact role which interpretant together with the notion of information play in Peirce's early treatment of deduction, induction and hypothesis as different species of the argument-genus, concentrating mainly on his conceptions and arguments either absent in his later treatments of the same subject, or unintelligible without the knowledge of the earlier theory, e.g. the concept of symbolization and its employment in Peirce's proofs of the validity of the three species of argument.

In the second part of the paper I will focus on showing certain distinguishing features of Peirce's early semiotic, building on the concepts examined in the first part. Here I would like to

present and argue for a view in which Peirce's semiotic can be seen as a product and synthesis of his earlier metaphysical and logical ideas. Since several of these connections have been already given account of, I will pay attention mainly to those having direct bearing upon the theory of interpretant and information examined. I consider these being the theory of the three worlds (and most importantly the notion of a formal world), the metaphysical notions of truth, externality and innateness from his *Treatise on Metaphysics* (W1: 57-84), and the very definition of metaphysics as "analysis of conceptions" (ibid.).

I will use Peirce's manuscripts of the given period (contained especially in the first volume of Writings) as my primary source. During the course of the paper, I will refer to existing studies more or less concerning the same topic (e.g. Murphey's *The Development of Peirce's Philosophy*, Esposito's *Evolutionary Metaphysics*) with some critical remarks.

Subject of the paper is Peirce's first account of semiotic from 1865 and its explanation in the light of his earlier metaphysical writings. Peirce's semiotic is understood as a fulfillment of the requirements of metaphysical inquiry being defined as an investigation of the conditions of possibility of empirical science, proceeding by a logical method constituted by unpsychological, formal treatment of thought.

1. Metaphysics and Representation

Peirce understood metaphysics in two ways, as "the philosophy of primal truths" (W1: 59) and "the analysis of conceptions" (W1: 63). The latter's subject is an explanation of meaning of terms such as "cause, substance, necessity" (W1: 240) and the like, the most fundamental of these conceptions being the categories.¹ We will not follow this part of Peirce's metaphysics any further in this paper.² In accordance with the former definition, metaphysics as "the philosophy of primal truths" (W1: 59) is the study of "primary conditions of all science" (W1: 59), its major-premisses (W1: 73), truths being predicated "*a priori* of the objects of experience" (W1: 61), or warrants "for inferring something not observed" (W1: 152).

What Peirce actually wrote in 1861-2 "Treatise on Metaphysics" and some other subsequent works counts rather as qualified suggestions than a fully developed theory? As I will argue it is Peirce's semiotic where we can find the actual fulfillment of these suggestions. Before that let us review some basic features of Peirce's metaphysics.

The center Peirce's reflections circle around is a proposition that experience can supply our reasoning with minor premisses only, i.e., particular propositions.³ No universal proposition can be given in observational experience.⁴ If we are thus to amplify our knowledge beyond the particular facts given in experience, we must assume the truth of a general proposition not derived from experience. Peirce's approach is transcendental in the sense that it deals with "primary conditions of all science" (W1: 59).⁵ It is on the other hand not critical in Kant's sense,⁶

¹ Ecuadorian Anthropologist. Visual Semiotic, specialist in Gender, Post-Colonial Aesthetics. National School of Anthropology and History, Mexico.

² It is a rather striking feature of Peirce's first formulation of semiotic that it is devoid of any explicit reference to the categories.

³ "All knowledge [...] is an inference from sensual minor premisses", W1: 75; see also W1: 152.

⁴ "A warrant for inferring something not observed is in itself an inference of something not observed. These assumptions [that "the observed result will be an indication of something not observed"], therefore, originate a priori. The science of these assumptions [...] is metaphysics.

⁵ "[T]he question what is the ground of scientific presumption and hypothesis [...] is a transcendental one" (W1: 240); "We find ourselves in all our discourse taking certain points for granted which we cannot have observed. The question therefore is what we may take for granted independent of all experience. The answer to this is metaphysics." (W1: 302)

⁶ "a call to reason to undertake anew the most difficult of all its tasks, namely that of self-knowledge", CPR A xi; "a critique ... of the faculty of reason in general", CPR A xii.

that of reason's inquiry into its own capacities, for he considers this approach as *petitio principii* (W1: 73, 77–78; Murphey 1993: 26–7), and the notion of unknowability of the *noumenon* as self-contradictory (W1: 40, 60). In his view it is objects which are the source and conditions of their knowledge. Peirce so entitles his approach as “uncritical transcendentalism” (W1: 79). The question of such metaphysics is in the first place that of accordance of a representation with its object, or, in Peirce's words: “How should the conceptions which spring up freely in our minds by virtue of the constitution thereof be true of the outward world?” (W1: 79). The method has to be devoid of any reference to psychology. Psychological (identified by Peirce with Kant's) method “starts by drawing the conceptions from the system of psychology and reasoning to their logical relations and meaning.” (W1: 63) In contradistinction to that Peirce suggest an unpsychological treatment of metaphysics, which “draws conceptions from no system but from the thoughts as they present themselves in their logical form - examining them logically - and finally puts them in their right place in the mind.” (W1: 63). One can taste here the appetizer of Peirce's much later Phenomenology or Phaneroscopy as a study of “the collective total of all that is in any way present to the mind” (CP 1.284). More importantly, Peirce is suggesting here a view of logic which is *materially indifferent*. As a study of form it does not need to consider the matter which embodies that form (the matter of thought) or the way in which this matter is present to us. “[M]eaning resides in words and other material representations” (W1: 306) Quite the contrary Peirce suggests that first we have to understand the concepts and their relations of forms of thought because the mind and its constitution are dependent upon them and not vice versa.

The main question of Peirce's metaphysics is “How are syntetical judgment in general possible” (W1: 248)? – “how can material inference be valid” (W1: 240) – “what is the ground of scientific presumption and hypothesis” (W1: 248) - What are the grounds of scientific inference? (W1: 279) The answer was given later, when he actually fulfilled the proposed metaphysical approach in his logic.

2. Towards the definition of logic

The purpose of this section is to show how Peirce arrived at his definition of logic as “objective symbolistic” (W1: 303). In 1865 Peirce gave a series of lectures at Harvard University which he called “On the Logic of Science” (W1: 161). The object of this logic is a study of synthetic, ampliative, or material inference, which is usually not considered to be a part of the logic proper. Although Peirce's concern is primarily with the scientific, or ampliative, reasoning we will see that in the end he presents a unified theory of all possible reasoning, offering principles for its generic unity and specific difference as well.

The main task of the first Harvard Lecture is to answer the question: What does logic study? What is its subject-matter? Peirce finds out that “The one great source of error in all attempts to make a Logic of Science has been utter misconception of the nature and definition of logic.” (W1: 163) The goal then is first to identify and clear up such misconceptions. So, the multitude of definitions of logic can be, Peirce observes, arranged into two classes: “those which do not and those which do give to logic a psychological or human character.” (W1: 163) Peirce's position rests in the former approach.

Since Kant, there has been a vast majority of the suffrages of logicians in favor of his definition of logic which is as follows - the science of the necessary laws of the Understanding and Reason - or what is the same thing - the science of the sheer Form of thought in general. Observe the two branches of this statement the former more psychological the latter scarcely at all so; one has two faculties and their capacities, the other thoughts as *objects* with forms. This is certainly the best definition yet given. (W1: 164)

Peirce thus sets out in the direction of unpsychological view of logic, of the formal treatment of thought. But he does not stop here and suggests that “we ought to adopt a thoroughly unpsychological view of logic.” (W1: 164) This thorough-going antipsychologism rests on the contention that the forms studied by the logician does not have to be forms of thought only (see W1: 164-5). Peirce speaks of either “form” or “logical character” (W1: 164) Every such form or character is said to have its “continual determinator”, which is any kind of matter in which the logical form could be embodied. “[A] continual determinator of a form is that in which the form inheres by the definition of the realtion of *substantia et accidens*.” (W1: 165) So the subject-matter of logic is further approximated: it is any substance (be it mental or material) capable of being a vehicle of – or, which is capable of being predicated to embody – a certain logical character or form. Thus we move from approximating logic as a formal treatment of thought to the understanding of logic as being entirely materially indifferent.

The proposition that there are substances which are continual determinators of forms studied by logic is very soon replaced by an equivalent proposition that logic is a study of representations (W1: 169). Since we can obviously come with various examples of representations which are not logician's concern, like a portrait, before proceeding further we have to discuss what representation is as a genus and to which species it can be divided in order to find out which species of representation is the subject-matter of logic.

In the period we are concerned with Peirce generally distinguishes three kinds of representations: copy, sign, symbol. They are classified “according to the different ways in which they may accord with its object.” (W1: 169) This accordance is synonymous to truth (W1: 79–80; 169–170). Representations are then divided by a different ways in which they may accord with its object. First kind of representation Peirce calls a *copy*, which he defines as consisting in the “sameness of predicates” of the representation and its object. From this definition can be inferred that any thing is a copy of some other thing given two limiting cases: if a representation had all the predicates of its object, the two would become identical (granted Leibniz's principle of the identity of indiscernables), on the other hand “no two things are so different as to resemble each other in no particular” (W1: 170).⁷ So for any two things there always is some predicate which they have in common, and some other, which they do not. Therefore, every copy is a partial truth and partial falsehood (W1: 170). Logical representations, on the other hand, “have absolute truth and falsehood” (W1: 170), and copies thus are not logician's concern. Second of the three species of representation is a *sign*. It has two distinctive characteristics. It is a representation of an individual object or objects, and its denotation is “fixed upon by convention” (W1: 170). As complete determination and individuality of reference is a limiting and unreachable character of a copy, so does sign lack “genuine generality” (W1: 170) which it cannot attain. It can denote a plurality of objects, but each one of them must be imposed upon the sign. Because “logic deals only with general terms”, a sign cannot be a proper object of logical study (W1: 170). The conditions which are necessary for a representation's being logical are met in the *symbol*. “The third kind of truth or accordance of a representation with its object, is that which inheres in the very nature of the representation whether that nature be original or acquired. Such a representation I name a *symbol*.” (W1: 170)

In the Harvard Lectures symbol is seen from a certain developmental point of view which is absent in Peirce's later writings. It is presented as originally being a sign in the above sense, i.e., being a representation of an *individual* conception. Through the process of its use it became more and more closely associated with that conception as to become in the end identical with it. For example the word “mushroom” was in the beginning an individual sign of the conception

⁷ Peirce gives a proof of this proposition in EP 1: 174.

of this organism which as a mental conception was general. It signified the idea of a mushroom *mediately* through the concept to which it was imposed. In the end the word became so intimately connected with the conception that it started to signify it *immediately*. “Now this readiness of excitation obviously consists in this; namely, that we do not have to reflect upon the word as a sign but that it comes to affect the intellect as though it had that quality which it connotes. I call this the acquired nature of the word, because it is a power that the word comes to have, and because the word itself without any reflection of ours upon it brings the idea into our minds.” (W1: 172–173)⁸

After this classification is provided, Peirce may return to the question of the subject-matter of logic. “I define logic therefore as the science of the conditions which enables symbols in general to refer to objects” (W1: 175). Logic is conceived of as “objective symbolistic” (W1: 303), that part of semiotic (“the general science of representations”, W1: 174) which deals with symbols, but not from all points of view (since symbol is related to its own essence, its object, and equivalent representation addressed by it), only as considering its objective relation. Thus Peirce’s unpsychological treatment of logic is based upon semiotic. The semiotic does not rest on any reference to the mind, but on the other hand, as far as mind has to be considered at all, it must obey the logical laws, which have a higher authority than the laws of the mind.

3. Objective Symbolistic

Such account would be incomplete, if we did not consider some other notions, which are of fundamental importance for Peirce’s project of offering the grounds of inference. One of these is the notion of *interpretant*. Interpretant is a representation representing some other representation as representing a certain object and therefore is itself a “more complicated” representation of the same object, being more complicated because it does not represent the object only, but also its representation. (see W1: 303) The example of interpretant *par excellence* is a conclusion of an argument – it represents the premisses as being a representation of an object (subject-term) as the conclusion itself is. Thus it has a crucial role in distinguishing the kinds of inference – every inference as symbolization (symbol-making) is a *production of an interpretant*. And the inferences are then distinguished by way of how this interpretant is produced. The quantity of an interpretant Peirce calls *information* (W1: 465). Every symbol possesses, along with the more familiar connotation and denotation, this quantity. Connotation of a symbol-term is a sum total of *marks* which are predicated whenever the symbol is predicated of something. Denotation is a sum total of individuals of which a symbol may be truly predicated. Information is defined as the product of connotation and denotation. Two cases can be distinguished. In analytic inference the product of any term’s denotation and connotation is constant in the premisses and the conclusion – the increase of one quantity is always accompanied by the decrease of the other and vice versa – so analytical inference does not bring any new information. In the case of syntehctic inference on the other hand, the increase of one quantity is possible with the other remaining constant – so new information is added either by means of extending denotation (as in induction) or connotation (as in hypothesis) of term in the conclusion as compared to the premisses. While copies have connotation only and sign denotation only, it is an essence of any symbol to have information, that is, to *denote by connoting*. (W1: 272)

The last among these notions is *symbolization*. It is a notion identical with inference, they being “the same notions” (W1: 280). Symbolization is making of a symbol-conclusion out of a symbol-premisses, and it also accords with the definition of interpretant – *the premisses are symbolized to the conclusion which is their interpretant*. Symbolization is conceived as replacing the

⁸ This conception is based upon Peirce’s reading of Locke’s Essay, iii.2, 4–7.

term in the premisses by either (a) one having the same information, as in deduction, or (b) by a more connotative one, as in hypothesis, or (c) by a more denotative one as in induction. These correspond to the three possible objects or references of the symbol (symbol, form, thing)⁹. The transcendental principle upon which the validity of inferences, their generic unity and specific difference are grounded Peirce thus formulates as “All things, forms, symbols are symbolizable.” (W1: 282; see also W1: 280–281). We may so turn to the examination of grounds of inference.

The core of Peirce's explanation is that the ground of an inference is valid if it can be derived by the very same inference it is intended to support. This rests upon a premiss that the kinds of reasoning are mutually irreducible (which itself rests upon the fact that they exhibit the forms of the three syllogistic figures which Peirce demonstrated to be irreducible¹⁰). For a weaker inference cannot establish the validity of the stronger, while resting a weaker inference on the stronger would mean reducing it in which case it would not be distinct. Moreover, these grounds are the logical grounds which depend on the property of symbols and so rest on the same ground as Peirce's logic in general – so they are metaphysically valid as far as Peirce's logic is metaphysics.

Now there are exactly three kinds of inference, that is, three kinds of possible symbolization: deduction, hypothesis, and induction. They all belong to the same genus, they are kinds of possible symbolization. But symbolization has three distinct species and thus there is also a specific difference between the inferences, which correspond to the three possible references of a symbol: symbol, form, or thing. Since these are the three references every symbol qua symbol must have, and since inference is symbolization, that is making a symbol out of another, then we can symbolize either (i) a symbol, as in deduction; (ii) a form, as in hypothesis; (iii) a thing, as in induction.

To give examples let us consider these three forms of symbolization.

Deduction	Hypothesis	Induction
All elves are immortal. Galadriel is an elf. Galadriel is immortal.	Only a very absent-minded person would forget his walking-stick in the detective's office. Dr. Mortimer has forgotten his walking stick in the detective's office. Dr. Mortimer is absent-minded.	Neat and deer are herbivora. Neat and deer are cloven-footed. All cloven-footed animals are herbivora.

In the first case of deduction, no new information is added to the term “Galadriel”. In the case of hypothesis, in the second premiss the connotation of “Dr. Mortimer” is “who has forgotten his walking-stick in the detective's office”, while in the conclusion, its connotation is increased by adding to it the predicate “is absent-minded”. In the case of induction the class of herbivora denotes only “neat and deer”, while in the conclusion it is increased to cover “all cloven-footed animals”.

Peirce then goes on to prove that all three inferential (symbolical) species are valid. Since there are three *irreducible* kinds of inference where each one has its own leading principles which cannot be reduced to any other. Peirce concludes that each symbolization must be proved by its own leading principles, that is, symbolization of symbol deductively, symbolization of

⁹ These can be perhaps distinguished as Ockham's *suppositio materialis*, *suppositio simplex*, and *suppositio personalis*.

¹⁰ See W1: 372–373 for that demonstration.

form hypothetically, symbolization of thing inductively. What does however Peirce prove by this procedure? It is not, he says, “that the kinds of inference are valid, since their proof, on the contrary, must rest on the assumption of that validity. Their use is only to show what the condition of that validity is.” (W1: 184–185). What he states is that, paradoxically, there can be no *apodictic* warrant of the scientific inference. Such a demand would be contradictory – if scientific inference was a *priori*, it would lose the character which makes it a scientific inference – inferring something *not known* – and knowable only by scientific reasoning. As we saw, Peirce said, that synthetic inference assumes the validity of some truth which is not given in it. This *must* be the case for inferring something not yet known, there must be something unknown. Thus, induction and hypothesis cannot be proven apodictically, because, in contradistinction to symbols, they depend upon the symbolization of things and forms, and we can never be sure that we infer correctly in a particular case, what this form or thing is. It is on the other hand guaranteed, that in general, if there is to be any synthetic inference at all, these forms must be valid.

4. Conclusion

We have thus seen some connections which can be found between Peirce’s early metaphysics and his little-later logic, grounded upon the notion of representation. Peirce proposed a logical treatment of metaphysics, which was seen upon its semiotic ground possible, with logical laws have higher authority than the laws of the mind. His definition of “philosophy of primal truths” is mirrored by working-out of the grounds of inference in his logic. Upon the notion of symbolization he shows what are the grounds of inference, and is able to unify synthetic and analytic reasoning in a single theory on the ground of their belong together to the genus symbolization, as well as their specific difference as symbolizing by different leading principles. Such an inquiry is transcendental because if we are to arrive at any knowledge the validity of forms, by which it can be given to us, must be the case without which such knowledge would not be possible. To end up by one last quotation:

[T]o the pupil of Kant as to the pupil of Aristotle the Analytic of Logic is the foundation of Metaphysics. We find ourselves in all our discourse taking certain points for granted which we cannot have observed. The question therefore is what we may take for granted independent of all experience. The answer to this is metaphysics. But it is plain that we can thus take for granted only what is involved in logical forms. Hence the necessity of studying these forms. (W1: 302)

Abstract

Este estudio surge del interés por realizar una revisión sistemática de los estudios de semiótica que se han producido en Chile desde la década de 1970 hasta el 2013 y organizarlos a través de una cartografía. La reflexión intenta revisar los bordes que sostienen al campo de estudio de la Semiótica en el país y responder sobre el lugar que le corresponde como campo disciplinario en el marco de la producción de conocimiento en sus dimensión teórica (epistémica) y metodológica.

Desde algunos años existe la preocupación en Latinoamérica por reinventar, por re – trazar la historia y las lógicas del desarrollo de la semiótica, ciencia que ha tenido en el mundo, una institucionalidad reconocida y diversa al mismo tiempo, pero que ha seguido desarrollándose de manera creciente (Escudero, 1998; Magariños de Moretin, 2004)).

Los escasos trabajos que se han propuesto revisar la historia y el dominio de la semiótica en Chile han sido insuficientes y parciales. No han logrado dar cuenta de manera sistemática del aporte de esta disciplina al desarrollo de las ciencias sociales, de las Humanidades, ni han propuesto una visión sistemática en torno al origen y desarrollo de sus aspectos teóricos y metodológicos. De manera parcial algunos investigadores mediados por las circunstancias históricas – políticas (Del Villar, 1996) y/o de áreas disciplinarias, (Gallardo y Sánchez, 1989; Jofré, 1997, y, más tardíamente, desde el cuerpo, Ponce, 2010) no se advierte a la fecha, que exista una visión integrada del campo de la semiótica en Chile. La imagen proyectada de la disciplina en los

antecedentes mencionados, se muestra asociada a estudios desde la lingüística, desconociendo aquellas áreas no indagadas (artes, teatro, cuerpo, interculturalidad) y los periodos no considerados (2000-2013) dentro de los primeros intentos de abordar estudios sobre la disciplina. Por tanto, la cartografía que se propuso en el marco de un proyecto de investigación asociado con universidades nacionales y de la región latinoamericana y financiado por la Universidad de Concepción, quiere dar cuenta, precisamente, de un trabajo acumulado de manera dispersa, fruto muchas veces de iniciativas personales que requieren ser atendidas, de manera integral, tal es el caso de la semiótica.

En este trabajo se dará cuenta de algunas reflexiones a partir de resultados preliminares de este proyecto de investigación. En particular, se intentará aportar un marco tentativo de clasificación de las investigaciones semióticas chilenas en función de sus compromisos más o menos explícitos con determinadas corrientes epistemológicas y/o metodológicas.

1. Introducción

Este trabajo es parte de un Proyecto de Investigación adscrito a la Universidad de Concepción¹ y que se realiza actualmente en conjunto con otras dos universidades, una de ellas chilena (Universidad de La Frontera) y la otra, argentina (Universidad Nacional de Misiones). El objetivo de dicha investigación es realizar una descripción sistemática del estado actual y evolución del dominio de la semiótica en Chile, desde sus inicios formales como informales (1969-2012), que permita proponer una Cartografía de Investigaciones Semióticas en el país y conocer las condiciones teóricas (epistémicas y metodológicas) y prácticas (institucionales) que han posibilitado la aparición y el desarrollo de la disciplina semiótica en Chile.

Este artículo tiene por objetivo elaborar una revisión panorámica de los estudios de semiótica en Chile con énfasis en las últimas dos décadas de su desarrollo y aportar un marco tentativo que permita clasificarlas en función de sus compromisos más o menos explícitos con determinadas corrientes epistémicas y/o metodológicas.

Dos trabajos previos (Gallardo & Sánchez, 1981 y Rafael del Villar, 1998) han realizado sendos estados del arte de la semiótica en Chile. Estos dos aportes constituyen información imprescindible sobre dos momentos cruciales de la semiótica en Chile. El primero de ellos, fruto de la colaboración entre el lingüista chileno Andrés Gallardo y el investigador en educación, Jorge Sánchez (a la época, ayudante de Gallardo), permitió adscribir a la disciplina semiótica un conjunto de trabajos provenientes de los más diversos campos disciplinarios a los que se les reconoce, no tanto su adscripción formal, sino su pertinencia semiótica desde el punto de vista de los autores. En este sentido el trabajo de Gallardo y Sánchez (1981) constituye una indagación temprana de los trabajos de semiótica en Chile, la cual (como veremos más adelante) tenía en ese entonces apenas 10 años de desarrollo en el país. En un segundo momento, con ocasión de la constitución de la Asociación Chilena de Semiótica y de la realización de su primer Congreso en 1996, Rafael del Villar (1996, traducido luego en Del Villar, 1998), lleva a cabo una nueva revisión diacrónica proponiendo tres grandes periodos o formas que adquirió la semiótica en Chile desde su instalación a fines de los años sesentas.

Al margen de la exactitud o imprecisión de estos trabajos tempranos, se debe reconocer el enorme valor que tuvieron como una forma de traer a la existencia, a través de la palabra, una disciplina a partir de una constelación de investigaciones muy diversas inspiradas en teorías que aparecieron tímidamente en Chile y que recién vinieron a institucionalizarse a fines de los años noventa.

¹ Se trata del proyecto VRID Asociado N° 213.174.006-1.0 "Cartografía de investigaciones semióticas en Chile" financiado por la Vicerrectoría de Investigación y Desarrollo de la Universidad de Concepción, bajo la dirección de la Dra. Elizabeth Parra y que se realizará entre los años 2014 y 2016.

Ahora bien, casi 20 años después del último estado del arte de la semiótica chilena, es lógico preguntarse ¿qué ha pasado a partir de 1996 con la semiótica en Chile?, ¿es posible detectar nuevas tendencias o nuevas etapas a partir de 1996?, ¿la lógica de desarrollo de esta disciplina sigue siendo la misma o ha cambiado? En caso que descubramos cambios importantes, ¿cuáles son los hitos que han marcado las transformaciones de la semiótica durante los últimos 20 años?

Para responder a estas preguntas es necesario revisar nuevamente los estadios fundacionales de esta disciplina y establecer a partir de ellos las líneas de desarrollo que marcarán su identidad actual.

2. Hitos fundacionales de la semiótica

Chile es un país que se conforma en el siglo XIX bajo el alero de la tradición europea guiado por los valores de la Ilustración adoptando modelos culturales provenientes de Francia y también un modelo económico y político europeo. Hablar de los orígenes de la semiótica en Chile es remitirse a académicos e investigadores formados en Europa en los años cincuentas y sesentas del siglo pasado. Tal es el caso de Eliseo Verón en Argentina, gran referente intelectual latinoamericano, quien se instaló en París y terminó convirtiéndose en un embajador del desembarco del estructuralismo en la región y, en particular, en Argentina y Chile.

En 1968 como ayudante de Levi-Strauss, Verón tradujo al español, la *Antropología Estructural* (Scolari, 2010-2011). Al igual que otros investigadores en Francia, se sumó a la tarea de elaborar una ciencia general de los sistemas de significación poniendo énfasis en la construcción de teorías y en la adecuación de los instrumentos técnicos a los modelos teóricos. Su aporte en ese momento apuntó a la refutación y crítica del funcionalismo (Ravera, 2000 citado por Scolari)

Tal como sucedió en Argentina, en la primera fase de la semiótica en Chile confluyeron el estructuralismo de una matriz saussureana y las teorías de comunicación social norteamericana de carácter pragmática. A juicio de Raver citado por Scolari, (2000) se partió del supuesto que la significación es una producción social, que los estudios empíricos discursivos son imprescindibles y que la dimensión ideológica no funciona como un cierto tipo de mensaje sino como un nivel de lectura de los discurso sociales.

En los años sesentas, en el Chile “pre-revolucionario”, según la expresión de Scolari (2010-2011:15), los estudios de comunicación y, de paso, los de semiótica, fueron impulsados por otro investigador crucial que sintonizó a Chile con el fructífero debate intelectual que instaló a la semiología y a las ciencias de la comunicación en la institucionalidad científica de Francia. Armand Mattelart, quien había llegado al Chile en 1962 a realizar estudios de corte sociodemográfico, se convence, hacia fines de la década del sesenta, de la necesidad de recombinar el marxismo con la *sémiologie* con el objetivo de potenciar la capacidad crítica de las ciencias sociales. Los resultados de aquellas hibridaciones fueron explosivos para los estudios de medios en Chile cuya base provenía de la Mass Communication Research. En ese contexto, la investigación basada en la denuncia de la concentración de los medios debía ser complementada por investigaciones orientadas al análisis ideológico del contenido de los medios. Un análisis que, a diferencia del análisis de contenido explícito tal como se realizaba en la tradición norteamericana en ese entonces, tomaba la forma de los análisis mitológicos que Roland Barthes y su equipo en el CECMAS en Francia habían comenzado a realizar.

Entre los investigadores chilenos estas propuestas de Armand Mattelart fueron acogidas con entusiasmo y aplicadas en las investigaciones críticas que caracterizaron la agenda investigativa de los años previos al golpe de Estado, las cuales más tarde decantarían en la diferenciación entre estudios semiológicos y estudios de economía política de la comunicación.

Zarowsky, investigador argentino (2008) subraya la importancia que tuvieron para este giro paradigmático, los estudios tardíos de Mattelart en Chile. Es sólo a partir de 1969, y forzando

los límites impuestos por la aproximación sociodemográfica que Mattelart comienza a abordar aspectos culturales y mediáticos de los procesos sociopolíticos e institucionales desde una mirada semiológica y estructuralista.

Tal como cuenta Zarowsky, el mismo Verón en 1974, miró con desconfianza las primeras “inserciones de la semiología en Argentina y Chile” advirtiendo sobre las distorsiones ideológicas que podrían producirse a partir de un uso culturalmente dependiente de categorías teóricas elaboradas en contextos socio-culturales extranjeros (Verón, 1974: 121). En ese mismo artículo, Verón critica en estas primeras investigaciones semiológicas chilenas, lideradas por los Mattelart, la práctica de una *lectura intuitiva* a la que le faltaba un corpus teórico estrictamente definido y una metodología rigurosamente explicitada (Verón, 1974: 122–123). Al respecto señala que “No me parece sorprendente que buena parte de los análisis emprendidos por los colegas chilenos no vaya, en los hechos, más allá de la práctica intuitiva de la lectura ideológica de los textos” (Verón, 1974:122).

A su vez, Verón (1974:123) señala que “La contradicción entre la demanda práctica (política) y las condiciones de la investigación es aún más clara en el estudio de Mattelart y Dorfman sobre el Pato Donald. En este trabajo no sólo se aplica como método el comentario intuitivo e interpretativo del material [de una manera que es, dicho sea de paso, sumamente dudosa]; el caso me parece más grave: *el problema del método ha desaparecido completamente como problema*” [las cursivas son del original].

Las observaciones de Verón en torno a la emergencia de los estudios semióticos o semiológicos en Argentina y Chile, tienden a confirmar un triángulo de influencias intelectuales entre estos dos países y París a fines de los años sesentas. Tal como lo demuestra Zarowsky en su trabajo de 2008, estas influencias tuvieron la forma de contactos esporádicos, pero significativos entre los equipos de investigación constituidos en torno a las figuras de Armand Mattelart en Chile y Eliseo Verón en Argentina.

3. Dos intentos retrospectivos

Como se indicaba al principio de este artículo, en Chile existen dos intentos por hacer el estado del arte de los estudios semióticos a nivel nacional. Estos dos intentos están separados por diez años. El primero de ellos se llevó a cabo en 1986 y el siguiente en 1996. Tras ellos, con excepción de los recientes intentos de los autores de este artículo, no se han realizado nuevos esfuerzos. Vale la pena revisar cuáles fueron los criterios de clasificación, las metodologías de indagación y los resultados de estos intentos previos.

Desde el sur del país, los académicos de la Universidad de Concepción, Gallardo y Sánchez (1986), y por encargo de Thomas Sebeok, pueden considerarse los primeros que de manera intuitiva, elaboran un panorama de los estudios de semiótica en Chile. Ellos señalaron que el primer obstáculo que tuvieron al presentar el desarrollo de la semiótica tuvo que ver con la delimitación del campo de la disciplina. En el contexto de una reflexión sobre el tema, de manera arbitraria establecieron que una obra intelectual es semiótica cuando se refiere a los sistemas de signos, como tal, es decir, cuando hay una conciencia explícita de tener que ver con los sistemas de significación y una voluntad manifiesta de dar cuenta de los de una manera sistemática. [traducción libre de los autores]

Respecto de la tradición semiótica que se practica en Chile, Gallardo y Sánchez (1986) se apresuran en aclarar que la mayor parte de la actividad semiótica en Chile se basaba en la tradición de la lingüística de Saussure. En ese contexto, los trabajos analizados se definen como estructuralistas e incorporan metodologías propias de la lingüística estructural.

La revisión desarrollada por Gallardo y Sánchez define cuatro áreas de desarrollo de la semiótica en Chile: 1) áreas de investigación, (lenguaje, literatura, medios de comunicación, expresión

artística, diseño, urbanismo y arquitectura, folklore, psicología social y filosofía); 2) descripción de sistemas de semiótica aplicada 3) trabajo institucional y 4) práctica semiótica.

Los primeros trabajos de semiótica detectados por estos autores constituyen aproximaciones aisladas que, en general, no tuvieron una continuación inmediata en las áreas del arte (Kupareo, 1964; Schwarztmann, 1969), la filosofía semiótica (Kupareo, 1964); la semiótica del folklore (Scharztmann, 1969), la psicología (Roa, 1971–1974, 1978), la lingüística (Sáez, Godoy, 1974; Rabanales 1973–1975); la literatura (Hozven, 1979), y los medios de comunicación (Colle, 1978), entre otros.

El trabajo de Gallardo y Sánchez tiene la ventaja de haber sido realizado en un momento muy temprano de la instalación de la semiótica en Chile y entregar un análisis perspectivo de las áreas que en ese momento aparecían como relevantes para la disciplina. Los desarrollos ulteriores que ésta tuvo en nuestro país tienden a confirmar la relativa dispersión inicial de los estudios iniciales de la semiótica nacional y su baja institucionalización haciendo que las investigaciones pioneras fueran fruto de la iniciativa individual más que los esfuerzos colectivos.

Metodológicamente, el artículo de Gallardo y Sánchez, constituyó un estudio exploratorio y en ese sentido conscientemente limitado. Según lo indicado por sus propios autores² esta revisión respondió a una oportunidad de incorporar un capítulo en la obra colectiva de Thomas Sebeok sobre el estado de la semiótica diversos países. Por esta misma razón los medios para garantizar una revisión bibliográfica exhaustiva (no obstante, el restringido campo científico de principios de los ochentas) fueron limitados. Por otra parte, las definiciones operacionales que permitieran establecer a ciencia cierta qué se considerarían un trabajo semiótico y qué no fueron reconocidamente problemáticas. Estas limitaciones, por supuesto, no restan valor a este trabajo pionero sino que deben servir para tomarse en cuenta en futuras indagaciones.

Posterior al trabajo de Gallardo y Sánchez, el académico de la Universidad de Chile, Rafael Del Villar (1996), en un breve artículo publicado por primera vez en francés en la *Revista Chilena de Semiótica*, elabora una sinopsis de los orígenes y desarrollo de la semiótica en Chile desde una perspectiva histórica – ideológica dividiéndola en tres etapas.

De la primera de las tres etapas de la semiótica en Chile (1969–1975), del Villar señala que la disciplina se integró a un proyecto político-epistémico de la estética y la crítica cultural. A su juicio, la intensa actividad política de esos años condicionó que la actividad se concentrara en llenar las “necesidades de ensoñación de la totalidad social”, al calor de la lucha ideológica, más que desarrollar una escuela semiótica. En efecto, en la década de los 70’ la efervescencia ideológica vivida terminó por acallar las voces de los intelectuales bajo la intervención de la dictadura militar.

La tradición estructuralista en Chile se combinó con una praxis de transformación social. Dos Centros de Investigación concentraron los trabajos de corte semiótico en este periodo: el Centro de Estudios de la Realidad Nacional y la Escuela de Arte de la Comunicación (EAC) ambos de la Pontificia Universidad Católica de Chile.

Dada esta situación inicial, Del Villar tipifica una segunda etapa (1975 hasta 1982) durante la cual, si bien tendió a perderse la vertiente más explícitamente crítica del análisis semio-ideológico, la semiótica se desarrollará en el campo de los estudios literarios y de la estética, al alero de los departamentos universitarios que se encontraban ya bien establecidos al inicio de la dictadura. Del Villar menciona ocho departamentos de Lenguas (o afines) en distintas universidades del país en los que se desarrollará una semiótica eminentemente literaria, “Campo Teórico Hegemónico”, según el autor. No obstante, a partir de la década del 80’ emerge una semiótica

² Varias de las informaciones incluidas a continuación proviene del diálogo sostenido con los autores con ocasión de la realización de las Segundas Jornadas de Formación Semiótica en la Universidad de La Frontera, Temuco, el 24 de julio de 2014.

de las comunicaciones, desde la cual se tratará de dar respuesta a problemas concretos impuesto por el sistema productivo comunicacional del sector privado y público.

En la tercera etapa (1982 – 1996), se produce lo que Del Villar denomina una “ruptura epistémica en el campo semiótico”. Por una parte, se continúa desarrollando la semiótica (y/o semiología) en el contexto de las disciplinas literarias y estéticas a partir de una lógica de desarrollo endógeno “cuya necesidad es la de la teoría”. Por otra, emerge una semiótica aplicada a las problemáticas comunicacionales con una lógica de desarrollo exógena, que tiende a responder a los requerimientos del cambiante entorno económico-comunicacional de las décadas ochenta y noventa.

4. Factores de una irrupción disciplinaria

Para Del Villar (1998), el desarrollo de lo que él llama el *Campo Teórico Semiótico de las Comunicaciones*, fue un reflejo directo de la expansión de lo que podríamos llamar emergencia del negocio o mercado de las comunicaciones en Chile. Vale decir, la progresiva demanda por servicios asociados a la gestión comunicacional de la empresa privada y las instituciones del estado, lo que incluye gestión de imagen y marca, publicidad, comunicación estratégica, etc.

Sin embargo, tal como indica el autor, la irrupción disciplinaria de la semiótica de la comunicación estaba además en sintonía con el nuevo paradigma que regiría la Educación Superior en Chile y, sobre todo, con el sistema de formación profesional que se desarrollaría en el país a partir de la privatización y masificación de la educación terciaria.

Este fenómeno (de carácter más institucional), está asociado al anterior (de carácter más económico) en la medida que existiendo demanda por comunicadores, consecuentemente se creó un campo de desempeño profesional y la consiguiente demanda de formación en esos campos.

En resumen, fuera de las evidentes transformaciones sociales y culturales que trajeron consigo las tecnologías de la comunicación y de la penetración de un sistema global de comunicaciones, dos fenómenos acompañan este quiebre epistémico de la semiótica en Chile: el desarrollo de las empresas de comunicación publicitaria, estratégica, corporativa, entre otros y la multiplicación, a partir de los años noventa, de las carreras de formación técnica en esta área. La semiótica aplicada a las comunicaciones responderá al llamado de estos nuevos escenarios.

El que hacer de la semiótica se diversifica en aplicaciones en un espacio socio-político cultural adverso que requiere un oasis para interpretar la realidad social que se vive. Por un lado, irrumpen nuevos géneros como el video música, video juegos y en particular, la comunicación orientada a la empresa como requerimiento de la construcción de imagen, identidad, la publicidad como estrategia de comunicación persuasiva y el diseño gráfico.

Por otro lado, los estudios de semiótica encuentran un nicho de desarrollo y cultivo en la enseñanza de Educación Superior. Los planes de estudios de programas de formación profesional y técnica y en particular las carreras relacionadas con las comunicaciones como periodismo, publicidad, audiovisual y diseño entre otras, para atender los requerimientos del mercado. En efecto, la comunicación organizacional aparece como un nicho de estudio que combina la semiótica como un campo asociado a la psicología y la sociología.

5. De las humanidades a las ciencias sociales

La semiótica que se practica en Chile desde la década del 60 siguió los mismos modelos que el resto de Latinoamérica de los estructuralistas aplicados a los campos literarios y medios de comunicación, este último bajo el modelo informacional, proveniente de Estados Unidos. Aun más, Del Villar (1996) señala que lo recurrente en el medio académico en la década del noventa consistía en archivar la semiótica en el dominio de la Ciencia Literaria como una corriente al interior de ella, ideología teórica que podrá ser correcta o no, pero cuyo efecto práctico no operaba a nivel concreto.

En el caso particular de Chile, la semiótica hasta fines de los años noventa fue pasando y dejando su huella de un campo disciplinario a otro dentro de las humanidades para pasar luego hacia sus márgenes e integrarse en contextos disciplinarios metodológicamente cada vez más cercanos a las ciencias sociales. Este hecho, no ha parecido llamar la atención de los analistas de la historia de la semiótica en Chile. La disciplina ha cruzado sin grandes problemas desde el campo epistemológico de las humanidades hacia el campo de las ciencias sociales. Áreas que en Chile aparecen altamente diferenciadas, pero que en el campo de las comunicaciones parecen confluir en objetos de gran complejidad con requerimientos teóricos y metodológicos propios de una aproximación interdisciplinaria. Este fenómeno no es exclusivo del contexto chileno, algo parecido es posible percibir en las investigaciones de los herederos de la semiótica en Argentina, España y Francia, por poner un ejemplo.

Por otra parte, el desarrollo de la semiótica como cualquier saber está asociado a un lugar y un tiempo determinado. En este caso, sus orígenes y posterior desarrollo estuvieron ligados a profundos procesos de confrontación ideológica en el país que provocaron que la semiótica fuera resistida como campo científico y no se la valorara en su real dimensión investigativa. Actualmente, se observa un intento por re-instalar la discusión teórica a partir de los cambios de paradigmas.

6. Tendencias actuales

Para indagar el estado de la semiótica en el siglo XXI se requiere poner de relieve la diversidad de campos en los que se ejercitan operaciones de tipo semiótico (Jofré, 1997) y que la atraviesan donde la temática central sigue siendo la doctrina de los signos o la teoría de las significaciones. Actualmente, se podría sostener que hay intentos de incorporar otras temáticas propias del giro propiciado por el académico italiano Fabbri (2004) como son la narratividad, las pasiones y la acción, dando paso a uno de los campos con proyección en el análisis semiótico como es el arte y el cuerpo (Ponce 2010, Contreras 2012). A juicio de Ponce, (2010), es precisamente esta nueva perspectiva de estudio la que permite que el arte en sus diversas manifestaciones se integre a manifestaciones culturales y que se reconozca la gestación de un giro en los enfoques de estudios semióticos en Chile que ameritan ser estudiados con mayor profundidad. Del mismo modo, la académica Salinas incorporó los estudios de género y el análisis de los discursos de los mineros de la zona norte del país.

Otras de las vertientes que nutren los estudios arrancan desde las Tics como son el estudio de Videoclips, anime japoneses de la mano del sociólogo Del Villar, quien ha generado una línea de investigación con un equipo de jóvenes investigadores.

Del mismo modo, en la zona austral de Chile, desde el ámbito del periodismo, la lingüística y la comunicación con Iván Carrasco, Rodrigo Browne, Rodrigo Moulian; Hugo Carrasco, Mabel García, Carlos Del Valle, Jaime Otazo, Luis Nitrihual y Javier Mayorga han generado líneas de estudios desde la comunicación intercultural. Más tarde y con el influjo de Verón y la categoría de *semiosis social* como de los *imaginarios sociales* con Pintos, Castoriadis, Baeza y Dittus entra en vigencia el estudio de la producción social de sentido para levantar una perspectiva socio semiótica.

En este sentido, la revisión actual apunta a dejar en evidencia, los procesos de significación emergentes, que dan paso a nuevas propuestas o líneas de trabajo.

7. Tensión entre docencia e investigación

Una de las características con las que se ha desarrollado la semiótica en Chile es su relativa ausencia de escuelas teóricas que representen o reflejen opciones disciplinarias propias en una dinámica reflexiva capaz de reelaborar la tradición o de romper con ella. Por el contrario, existe

una cierta tendencia a la dispersión de los esfuerzos investigativos que no redundan en una reformulación de los supuestos teóricos canónicos sino que permanecen en el ámbito de la teoría aplicada.

Una explicación posible de esta tendencia es que la semiótica chilena de los últimos años es sobre todo el resultado de una explosión de la docencia de esta disciplina en el contexto de las profesiones del campo de las comunicaciones más que de una real institucionalización a nivel científico disciplinario. Esto podría relacionarse también al hecho que la semiótica, a diferencia de las ciencias de la comunicación, no aparece inscrita como tal en la institucionalidad científica del país (por ejemplo, no está asociada a un grupo de estudios en Conicyt), pese a existir formalmente como asociación científica. A esto se suma la ausencia casi total de diplomas o grados en semiótica que sean otorgados por universidades chilenas (la excepción es del diplomado en Semiótica de la Facultad de Artes de la Universidad de Chile).

Estas hipótesis hacen que se torne importante generar una revisión sobre las orientaciones que ha seguido la disciplina a través de la tensión entre la enseñanza y la investigación de la semiótica en las instituciones de Educación Superior (Universidades e Institutos Profesionales) del país.

En la década del noventa se advierte ya un predominio de la enseñanza por sobre la investigación, que quizá hoy no se aprecia tan fuertemente pero que puede encontrarse al origen de la debilidad y dispersión que hemos señalado. Este predominio de la semiótica como objeto de docencia más que como objeto de investigación obedece a la ya comentada explosión de la creación de programas de formación tanto técnica como profesional en el área de las comunicaciones. Cada uno de estos programas incorporó fuertemente a la semiótica en su plan de estudios como una forma de proporcionar un marco teórico y epistemológico para comprender los sistemas de significación y los procesos de comunicación en sus aspectos más generales y abstractos. Aunque también se trataba de una asignatura capaz de modularse en diversas aplicaciones a sistemas de significación específicos tales como la semiótica discursiva, la semiótica visual y fotográfica, la semiótica del cine, entre otros. Desde este punto de vista, la semiótica se nos aparece hoy día a la vez como un factor germinal de las ciencias de la comunicación en Chile y como marco teórico epistemológico de las diversas disciplinas que concurren a la formación de los profesionales de la comunicación.

Cabe preguntarse por lo tanto, cómo se realizó, a partir de los años noventa, el paso de la semiótica desde la docencia hacia la investigación y cómo este tránsito se ha visto favorecido o entorpecido por la dependencia que desde esos años tiene la semiótica respecto de las ciencias de la comunicación.

Puesto que cada institución resolvió estas cuestiones de un modo ad-hoc recurriendo a la creatividad e intuición de los equipos académicos que fundaron las carreras de comunicación en Chile, equipos que estaban constituidos por un puñado de académicos e investigadores de las comunicaciones más un número importante de investigadores consagrados provenientes de áreas afines a la comunicación, tales como la literatura, la filosofía, la lingüística y otras, es difícil proponer un ejemplo paradigmático. Tal vez el caso que más se aproxima a ello sea el de la creación de la Carrera de Periodismo en la Universidad de La Frontera, a principios de los años noventa. Esta Carrera es la culminación de un proyecto de reformulación del quehacer académico del Departamento de Lenguas y Literatura de la recientemente creada universidad regional (derivada de las sedes locales de la Universidad de Chile y la Universidad Técnica del Estado). A partir de los años noventa, este Departamento que se redefine como Departamento de Lenguas, Literatura y Comunicación, se esforzó para ampliar su oferta de formación en el área de las comunicaciones creando en primer lugar la Carrera de Periodismo y seguidamente el Magíster en Ciencias de la Comunicación. El equipo que se hizo cargo de esta tarea estuvo

compuesto principalmente por investigadores provenientes de las áreas preexistentes del Departamento: literatura y lingüística.

¿Qué es lo que hizo posible la emergencia de estos programas de formación precisamente en este contexto académico de la Universidad de La Frontera? La respuesta a esta pregunta tiene que ver directamente con la disciplina semiótica, pues las tensiones disciplinarias entre literatura y lingüística habían sido resueltas [al menos temporalmente] mediante un dispositivo metateórico que permitía situar ambas disciplinas dentro de un dominio mayor: el estudio de los sistemas de significación y de los procesos de comunicación que no son otra cosa en conjunto que la semiótica (según la propuesta de Eco en *Tratado de Semiótica General*). De esta forma, se legitimó la pertinencia y la pertenencia disciplinaria de la comunicación en un Departamento académico que se debía más a las humanidades que a las ciencias sociales, lugar donde se suele ubicar hoy a las ciencias de la comunicación.

Este ejemplo da algunas pistas interesantes sobre el modo en que la semiótica habría permitido en Chile la colaboración, la intercomprensión, la convergencia interdisciplinaria así como la emergencia de nuevas disciplinas en el contexto de una institucionalidad científica altamente resistente a la aparición de nuevas unidades académicas o áreas de investigación.

8. Hacia clasificación de las etapas de las investigaciones semióticas chilena

A juicio del académico mexicano Cid (2002) para trazar una línea cronológica que permita intentar establecer las etapas de desarrollo de la semiótica del conjunto de teorías aplicadas al estudio del objeto y su diseño, habrá que remitirse a los hitos que la semiótica ha seguido desde su conformación como disciplina independiente hasta nuestros días y que se puede aplicar a Chile. Desde una perspectiva global, Cid señala que la semiótica en un primer momento estuvo abocada a los estudios precursores en la cual se definieron las bases para el dialogo interdisciplinario; luego, pasó , a la etapa pre semiótica, en la cual instrumentos no propiamente semióticos posibilitaron los primeros acercamientos al estudio del objeto como tal en el ámbito social y de su significado; la etapa translingüística, coincide con el traslado de los modelos lingüísticos al estudio del objeto, buscando las analogías que lo consideran capaz de constituir un lenguaje estructurado gracias a su posibilidad de comunicar y , por último, agrega una etapa semiótica que coincide con la profesionalización dela disciplina y de los modelos que se consolidan gracias al potencial explicativo alcanzado y a la profundidad de sus análisis mediante una enseñanza sistemática con diversos grados de especialización en los Centros Universitarios.

Dittus (2008:364) por su parte, advierte que en Chile, existe un retorno de la semiótica como instrumento de análisis social y como consecuencia los desafíos metodológicos que encierra. Considera que hay atisbos de líneas, aunque sin consolidarse como escuelas por el resabio de la impronta ideologizante de la semiótica debido a su cercanía con disciplinas de las ciencias sociales, sin embargo la tradición filosófica es lo que más ha pesado en su composición como disciplina.

En esta misma línea, Juan Manuel Fierro, académico de la Universidad de La Frontera, en el primer encuentro sobre el origen y desarrollo de la semiótica en Chile, realizado en Temuco (2014) señala que partiendo de la base tradicional de la semiótica asociada al estructuralismo vigente de la época (1970) se reconocen tres momentos en su desarrollo. En un primer momento, distingue una etapa de una semiótica teórica, clásica cuyo objeto de atención fue el signo asociada a Saussure y Peirce; un segundo momento, reconoce una semiótica de la comunicación cuyo eje fueron y son los sistemas de códigos asociado al estructuralismo lingüístico y un tercer momento cuyo centro de interés está en el sujeto y los procesos de significación asociados a la hermenéutica.

9. Algunas inferencias a modo de conclusión

9.1. Una de las constantes en el desarrollado de la semiótica en Chile es su relativa ausencia de escuelas teóricas que representen líneas disciplinarias en una dinámica reflexiva capaz de constituir una tradición.

9.2. Si bien ha existido la intención por retomar las cuestiones de base para revisar como se estaba operacionalizando el que hacer de la disciplina en el país, se sigue aún en el vértigo de listados de temáticas que no logran sacar a la academia de las disciplinas desde donde provienen generando más bien semióticas aplicadas.

9.3. La confluencia de disciplinas desde donde se estudia la semiótica traza, en cierta medida las líneas de una posición epistemológica: el pluralismo de las voces y de las temáticas, de horizontes muy diferentes, donde la mirada semiótica cruza otras prácticas sociales para trabajar allí donde opera la significación. (Escudero, Signa, n.7, 1998)

9.4. La semiótica al asumir la interdisciplinariedad como método otorga la posibilidad de desjerarquizar los saberes y los conocimientos para hacerse cargo más bien de las dinámicas y transformaciones que se buscan comprender e interpretar, más que en una lógica de descripciones.

Abstract

This paper evidences the philosophical orientation subtending Bakhtin's research on the interpretation of the literary text. If we separate this philosophical basis from his writings, it is easy to interpret him wrongly as a literary critic, as in fact has been the case. This implies not understanding the *sense* of his dedication to literary discourse. Publication of his early works, in some cases in recent times (between the second half of the 1970s and the second half of the 1980s) has greatly contributed to grasping this "sense". In the first place it is a question of understanding Bakhtin's "philosophy of the act, or deed" passing through a study of the relation between author and hero and therefore to his monograph on Dostoevsky (1st ed. 1929, 2nd ed. 1963) and ultimately to the study of the carnivalesque and the grotesque body through the works of Rabelais (as from the 1940s, even though Bakhtin's *Rabelais* was only published in 1965). Once the philosophical framework of Bakhtin's discourse and of his dialogism is made to emerge (the topic of the first part of this text), it is possible to relate Bakhtin's conception to Peirce's (the topic of the second part). This relation not only concerns their conception of the sign as they have proposed it. It also concerns the fact that traceable in both is a strong attention for the problem of otherness, listening and for the relation with the other in terms of "love". Both in the cosmic vision delineated in Peirce and in what Bakhtin calls the "great experience" – juxtaposing it to

the small and short-sighted experience of the individual subject assumed to be autonomous and separate from others – love becomes the essential relation not only for the human world, not only for life, but for the universe in its entirety (Peircean agapasm).

In his conversation with Saint Bernard in Paradise, Dante suggests that our body will be resurrected not for its own sake, but for the sake of those who love us – those who knew and loved our one-and-only countenance.

(Mikhail M. Bakhtin, “Author and Hero in Aesthetic Activity,” in Bakhtin 1990, pp. 57)

1. Mikhail Bakhtin’s philosophical vision

In his 1973 conversation with Viktor Duvakin, Mikhail M. Bakhtin says: “Marija Veniaminovna Judina was an absolutely unofficial person. Anything official was a burden for her. For that matter, the same as me. Neither can I suffer the official” (Eng. trans. from the Italian in Bakhtin 2008: 347).

Bakhtin, an unofficial person: with respect to official, public circles, he came from another circle, one tending towards unofficialness even before his arrest and conviction; and thanks precisely to such an attitude, he was able to proceed in his voyage of reflection and writing, during the many long years of total exclusion from the culture of his time (Ponzio 1992; Petrilli 2012).

In his text of the early 1920s, “K filosofii postupka”, where he introduces the notion of exotopy (*vnenakodimost’*), Bakhtin also introduces the notion of “architectonics” according to which all values, meanings and spatial-temporal relationships are characterized in terms of otherness: “I-for-myself, the other-for-me, and I-for-the-other”: “All the values of actual life and culture are arranged around the basic architectonic points of the actual world of the performed act or deed: *scientific values, aesthetic values, political values* (including both ethical and social values), and, finally, *religious values*” (Bakhtin 1993: 54)

Postupok, the word used by Bakhtin and consequently by Bocharov in the title of the text in question, means a lived act. The world of *postupok* is, according to Bakhtin, the *world of responsive praxis by the singular individual*. In this world, that which is endowed with abstract meaning and mechanical unity in the world of science, art, in academies, politics, technology, in the world of impersonal roles, jobs, tasks, duties, all this in the world of responsive praxis recovers sense and is integrated into the unity of responsible acts.

Postupok, *act*, or *deed*, contains “stup”, which means “step” in the sense of “decision”, “an important step”, “a big step”, “to take a step”, “bring himself to take a certain step”: initiative, stance, to pass from the level of the theoretic, normative, planning, to the level of personal answerable praxis. Bakhtin also uses the verb *postupať*, to act, to perform an answerable act, or deed.

In its connection with “to take a step”, “*postupok*” recalls the expression “transgredient”, connected in Bakhtin with “outsideness”, “exotopy”, “*vnenakodimost’*”: “transgredient”, from Latin *transgredo*; English, *step across, step over*. In “K filosofii postupka” Bakhtin characterizes the contemporary crisis as the crisis of the contemporary act, which has become technical, formal, mechanical action. He identifies this crisis in the separation of the act, with its concrete participative, responsible motivation, from its cultural product which is reified and as a consequence loses sense. This interpretation is similar to that offered by Edmund Husserl and his phenomenology, especially as developed in *Die Krisis der europäischen Wissenschaften und die transzendente Phänomenologie: Eine Einleitung in die phänomenologische Philosophie* (published

posthumously in 1954). But in Bakhtin, unlike Husserl where a certain theoreticism persists, sense is not conferred by the intentional consciousness, by the transcendental subject, but by responsible / answerable praxis without alibis as performed by the single unique individual (cf. Ponzio 2008a, 2008b).

In a passage from *Toward a Philosophy of the Act*, Bakhtin reflects on forms of proxy, in particular political proxy through which one's responsibility/answerability is delegated to another. Bakhtin refers to political representation where in the attempt at shirking political responsibility/answerability, the sense of uniqueness, of one's personal participation without alibis is often lost. As a consequence responsibility/answerability becomes void, specialized and formal with all the risks that this loss of sense involves (cf. *Ibid.*: 52).

As Bakhtin says:

In attempting to understand our whole life as secret representation and every act we perform as a ritual act, we turn into impostors or pretenders.

Being a representative does not abolish, but merely specializes my personal answerability. [...] The loss of once-occurrent participation in the course of specialization is especially frequent in the case of political answerability. The same loss of the once-occurrent unity takes place as a result of the attempt to see in every other, in every object of a given act or deed, not a singular individual which is concretely participative, but a representative of a certain large whole.

What is answerable does not dissolve in what is specialized (politics), otherwise what we have is not an answerable deed, but a technical or instrumental action (*Ibid.*: 52–53; Eng. trans. reviewed in light of It. trans. from Russian in Bachtin e il suo Circolo 2014: 125–126).

According to Bakhtin, Dostoevsky's "philosophy" must not be identified in the specific conceptions and standpoints of the heroes in his novels or in specific contents. He calls this mistaken interpretation "Dostoevskyvism". Instead, Bakhtin finds traces of the architectonics he theorizes in the overall structure of Dostoevsky's works which he describes as organized according to the principle of dialogism. This is what Bakhtin alludes to when he says, "affirmation of someone else's 'I' not as an object but as another subject" (Bakhtin 1963, Eng. trans.: 11), this is the principle governing Dostoevsky's worldview. Dostoevsky's "polyphonic novel" describes the character no longer as an "I", as an object, but as a centre that is "other," forming the perspective according to which his world is organized:

Dostoevsky carried out, as it were, a small-scale Copernican revolution when he took what had been a firm and finalizing authorial definition and turned it into an aspect of the hero's self-definition. [...] Not without reason does Dostoevsky force Makar Devushkin to read Gogol's "Overcoat" and to take it as a story about himself [...]

Devushin had glimpsed himself in the image of the hero of "The Overcoat," which is to say, as something totally quantified, measured, and defined to the last detail: all of you is here, there is nothing more in you, and nothing more to be said about you. He felt himself to be hopelessly predetermined and finished off, as if he were already quite dead, yet at the same time he sensed the falseness of such an approach. [...]

The serious and deeper meaning of this revolt might be expressed this way: a living human being cannot be turned into the voiceless object of some secondhand, finalizing cognitive

process. *In a human being there is always something that only he himself can reveal, in a free act of self-consciousness and discourse, something that does not submit to an externalizing secondhand definition.* [...]

The genuine life of the personality is made available only through a dialogic penetration of that personality, during which it freely and reciprocally reveals itself. (Bakhtin 1963, Eng. trans.: 49–59)

This is the itinerary followed by Bakhtin from his early works. Furthermore, thanks to his early interest in the philosophy of the responsible/answerable act, this itinerary coherently develops into an interest in the philosophy of literature, where *of literature* is a subject genitive: not a philosophical vision to which literature must be subjected, but a philosophical vision which literature, verbal art, make possible.

If we now examine the last paper published by Bakhtin during his lifetime, “Toward a methodology of the human sciences” (in Bakhtin 1979), written in 1974, we soon discover a surprising insistence on the same issue proposed at the beginning of his research itineraries. The material forming this paper was mainly written toward the end of the 1930s or beginning of the 1940s. It returns to the problem of the impossibility of applying categories proper to the subject-object relationship to the human world. When dealing with human expression, the criterion for evaluating knowledge is neither “exactness”, nor philosophical “rigour” in the Husserlian sense, but the “profoundness of answering comprehension”.

The centre of value in the world of aesthetic vision is not man in general, abstract man related to abstract values like good and evil, but a concrete human being, a concrete individual, a mortal human being. All spatial and temporal moments as well as all values such as good and evil, beauty and ugliness, truth and falsehood, become concrete moments only when they are correlated with concrete values in the architectonics of the concrete individual as a mortal human being. In the aesthetic chronotope all spatial and temporal relations are correlated with man and only in this relation do they acquire valuational meaning: “high”, “far”, “above”, “below”, “abyss”, “infinity”, boundlessness”. All these expressions reflect life and the tenseness of a mortal human individual: in the horizon and in the environment of mortal man space gains body, time possesses depth and weight (cf. Bakhtin 1993: 64–65).

Moreover, according to Bakhtin, the centre of value in the architectonics of the aesthetic vision is not man considered as self-identical, but “as a lovingly affirmed concrete actuality” (*Ibid.*: 63). All constitutive aspects of the architectonics of the aesthetic vision are encompassed by an all-accepting loving assertion of the human being. In this sense, the relation of the author, and consequently of the reader, to his hero is “an un-self-interested interest”, an un-self-interested participation. Says Bakhtin:

In this sense one could speak of objective aesthetic love as constituting the principle of aesthetic seeing (except that “love” should not be understood in a passive psychological sense). [...] The variety of human values can present itself only to a loving contemplation. [...] Only un-self-interested love on the principle of “I love him not because he is good, but he is good because I love him”, only lovingly interested attention, is capable of generating a sufficiently intent power to encompass and retain the concrete manifoldness of existing, without impoverishing and schematizing it. (*Ibid.*: 64; Eng. trans. reviewed in light of It. trans. from Russian in Bachtin e il suo Circolo 2014: 146–147)

On the contrary, an indifferent loveless, or hostile reaction is always a reaction that impoverishes, breaks, ignores, neglects. The biological function itself of indifference consists in diverting the attention from what is inessential for one's own needs: a kind of economy or preservation. And this too is the function of oblivion. In conclusion, as Bakhtin says: "Only love is capable of being aesthetically productive; only in correlation with the loved is fullness of the manifold possible" (Ibid.).

Therefore, what does responsive understanding consist of in life, in the architectonics of life, in its chronotope, that is, responsive understanding with respect to what we have experienced and understood in art, in its architectonics, in its chronotope, so that everything we have experienced and understood does not remain ineffectual in life? Bakhtin's answer throughout all his work is: responsive understanding consists in recognizing, in appreciating un-self-interestedly the value of the other, in listening to the other, to the other's distinctive, peculiar word, in everyday life, in all kinds of daily praxis.

2. Peirce's semiotics and agapastic forces in the universe

By reading together Charles S. Peirce and Mikhail Bakhtin, it is possible to construct a semiotic model that explains signs and semiosis in all their complexity. This sign model is distant from oversimplifying approaches that put the *signifiant* at the service of a *signifié*, already given outside the interpretation/communication process. Peirce places the sign in the complex context of semiosis and in the relation with the interpretant. Bakhtin evidences the fact that the sign can only flourish in the context of dialogism. The implication is that the logic of otherness is structural to the sign, that otherness is at the very heart of identity. The sign is not possible without an interpretant which means that the interpretant is not secondary, an accessory. Quite on the contrary, the interpretant is constitutive of the sign. This means to say that meaning is not in the sign, but in the relation among signs (Petrilli and Ponzio 2005, 2008). Bakhtin thematizes the dialogic nature of the word, including the word of interior discourse. Therefore, both Bakhtin and Peirce evidence the dialogical nature of the sign. In fact, to be this sign here the sign must be at once identical to itself and different. Indeed, the original modality of subsisting as a sign is otherness and dialogue. By contrast with univocality, reiteration, identity which characterize signals, dialogue and otherness are the original, constitutive modality of that which emerges as a sign properly understood.

The sign subsists as a sign insofar as it is a response. A sign is a sign in relation to that which is other from itself. In fact, the sign is differentiated both from the object acting as a referent and from another sign acting as interpretant, without which it could not be a sign. Peirce's definition of semiosis is based on the notion of interpretant which mediates between *solicitation* (*interpretandum*) and *response*. Mediation distinguishes semiosis from mere dynamical action. The latter alludes to "action of brute force" which characterizes the relation between the terms forming a pair. Instead, semiosis involves a triadic relation, it "is an action, or influence, which is, or involves, a cooperation of three subjects, such as a sign, its object, and its interpretant". Like Bakhtin, for Peirce too the relation connecting sign (interpreted) and interpretant is a dialogic relation. Both evidence the *dialogic* nature of sign and semiosis. In such a framework the role of otherness is no less than pivotal; as stated above, the original modality of the sign is otherness and dialogism. This aspect of Peirce's conception of the sign is central to my own interpretation of his philosophical perspective and its cosmic reverberations.

In the architectonics of Charles Peirce's philosophical system what he denominates as "chance", "love" and "necessity" indicate three modes of development regulating evolution in the cosmos. As he says in his essay of 1893, "Evolutionary Love":

Three modes of evolution have thus been brought before us: evolution by fortuitous variation, evolution by mechanical necessity, and evolution by creative love. We may term them tychastic evolution, or tychasm, anancastic evolution, or anancasm, and agapastic evolution, or agapasm. The doctrines which represent these as severally of principal importance we may term tychasticism, anancasticism, and agapasticism. On the other hand the mere propositions that absolute chance, mechanical necessity, and the law of love are severally operative in the cosmos may receive the names of tychism, anancism, and agapism. (CP 6.302)

Connections can be evidenced between Peirce's evolutionary cosmology, his semiotics and logic. The concept of *agapasm* and the connection with abductive inference is particularly interesting. Peirce made an important contribution to this area of research with a series of five articles published in the journal *The Monist*, beginning from 1891. In these articles he develops his evolutionary cosmology, introducing the doctrines of tychasticism (from Greek τύχη, tyche), anancasticism (from Greek ανάγκη, ananche), agapasticism (from Greek αγαπ, or ηγαπ, agape), and synechism (from Greek συνεχής, synechés).¹

Two later writings (1905) on "pragmatism", or the substitute term "pragmaticism",² unite the developments of Peirce's cosmology to his theory of semiotics: "What Pragmatism is?" (1905, CP 5.411–437) and "Issues of Pragmaticism" (1905, CP 5.438–463). In fact, we have seen that the interpretant plays a central role in Peirce's semiotics, which, in turn, is inseparable from his pragmatism as much as from his cosmology.

Peirce had already elaborated his doctrine of categories – firstness, secondness, and thirdness which are always co-present, interdependent and irreducible to each other –, in "On a New List of Categories" (1867, CP 1.545–559)³. His doctrine of categories constitutes the foundation of his ontology and cosmology. Therefore, Peirce's doctrine of categories is connected to his ontological-cosmological trichotomy (agapasm, anancasm, tychasm), to his triadic typology of inferential logic (abduction, induction, and deduction), and to his sign triads (in particular the tripartition between icon, index, and symbol) (Petrilli and Ponzio 2005).

As Peirce states in the citation above, three strictly interrelated modes of evolutionary development operate in the cosmos: *tychastic evolution* or *tychasm*, development regulated by the action of chance – "evolution by fortuitous variation"; *anancastic evolution* or *anancasm* which is dominated by the effect of necessity – "evolution by mechanical necessity"; and *agapastic evolution* or *agapasm*, oriented by the law of love – "evolution by creative love". The names of

¹ "The Architecture of Theories" (1891, CP 6.7–34), "The Doctrine of Necessity Examined" (1892, CP 6.35–65), "The Law of Mind" (1892, CP 6.102–163), "Man's Glassy Essence" (1892, CP 6.238–268), "Evolutionary Love" (1893, CP 6.287–317), and "Reply to the Necessitarians. Rejoinder to Dr. Carus" (1893, CP 6.588–6.615).

² Charles S. Peirce introduced the term "pragmatism" in the 1870's to nominate his principle of inquiry and his account of meaning according to which any statement must have practical bearings to be meaningful. The pragmatic account of meaning provided a method for clearing up metaphysical ambiguities and assisting scientific inquiry. However, Peirce was unhappy with both his own early formulations and the developments made by his fellow pragmatists William James and John Dewey in the U.S.A, and Ferdinand C.S. Schiller in Great Britain. Consequently, he was led to reformulate his own original account of pragmatism which he renamed "pragmaticism" in order to distinguish it from subsequent and more "nominalistic" versions. For further considerations on the terms "pragmatism" and "pragmaticism", see Petrilli 2010a: 50, n. 2; see also each of my entries on Morris, Peirce and pragmatism in Copley 2001 and 2010a.

³ "On a New List of Categories" is usually referred to as an 1867 paper, which is the year it was delivered as an oral presentation (14 May) to the American Academy of Arts and Sciences. It was subsequently published the year after, in 1868, in the relative Proceedings (n. 7, pp. 287–98).

the doctrines that elect these three evolutionary modes as their object of analysis are, respectively, *tychasticism*, *anancasticism*, and *agapasticism*. Whereas the terms tychism, anancism and agapism name “the mere propositions that absolute chance, mechanical necessity, and the law of love are severally operative in the cosmos...” (CP 6.302).

Each of these three main evolutionary modes contains traces of the other two; therefore they are not pure, but rather contaminate each other reciprocally. In other words, they act together in different combinations and to varying degrees, reaching different states of equilibrium in evolutionary processes that are dominated now by chance, now by necessity, now by love. Consequently, far from excluding each other, tychasm, anancasm, and agapasm share in the same general elements which, however, emerge most clearly in agapastic evolution. Evoking the language of mathematics, Peirce describes tychasm and anancasm as “degenerate forms of agapasm”; in other words, agapasm englobes the former as its degenerate cases (CP 6.303).

Tychasm shares a disposition for reproductive creation with agapasm, “the forms preserved being those that use the spontaneity conferred upon them in such wise as to be drawn into harmony with their original” (CP 6.304). This, as Peirce continues, “only shows that just as love cannot have a contrary, but must embrace what is most opposed to it, as a degenerate case of it, so tychasm is a kind of agapasm” (CP 6.304). However, unlike tychastic evolution which proceeds by exclusion, in genuine agapasm, advance takes place by virtue of a “positive sympathy”; in other words, by virtue of attraction or affinity among the “created” – read “interpretants” – “springing from continuity of mind” (or synechism) (CP 6.304).

The overall orientation of anancasm is regulated by “an intrinsic affinity for the good”. From this perspective, it too is similar to the agapastic type of advance. However, as close to agapasm as it may be, anancasm lacks in a determinant for evolution; the factor of “freedom”, which instead characterizes creative love and subtends tychism (CP 6.305).

Agapasm, understood as a force of development through affinity and sympathy, is strongly iconic (correlate terms being notoriously the index and symbol). It is tantamount to the force of attraction, that is, to the relation of similarity or affinity among interpretants. Though the action of chance and necessity are foreseen in agapastic evolution, the forces of attraction, affinity, freedom, and fortuitousness dominate. This means to say that when agapastic forces prevail in the continuous (synechetic) flow of infinite semiosis, iconicity dominates over indexicality and symbolicity in the relation among interpretants.

The concept of continuity or synechism involves that of regularity. As emerges from her own philosophy of signifying and interpretive processes, Victoria Welby too believes that development is articulated in an open structure, therefore that continuity presupposes relational logic grounded in otherness (Welby 1983). The logic of otherness may be considered as a sort of dialogic – a logic that recovers the dimension of *dialogism* in Mikhail Bakhtin’s sense (see Petrilli 2012, 2013). In other words, following both Peirce and Bakhtin, dialogism is understood as a modality of semiosis, which may or may not involve verbal signs and may or may not take the form of dialogue (Bakhtin 1981; Ponzio 2006a). Thus described, dialogism is determined by *the degree of opening towards otherness*. Agapastic evolution is achieved through the law of love; creative and altruistic love, love founded on the logic of otherness, what we have described as *absolute otherness*.

With “pragmaticism”, Peirce coherently developed his cognitive semiotics in close relation to the study of human social behaviour and the totality of human interests, thereby evidencing the necessary implication of problems of knowledge with problems of the pragmatic and axiological orders. Beyond “reason”, Peirce theorizes “reasonableness” understood as open-ended dialectical-dialogic semiotic activity, unfinished and unfinalizable, unbiased by prejudice and regulated by the logic of love, otherness and continuity or “synechism”. He supercedes the limits of cog-

nitivism orienting his semiotic research in a pragmatic-ethic or evaluative-operative direction.

The dialogic conception of signs and the logic of otherness that orientates it are a necessary condition for Peirce's doctrine of continuity, or synechism: the doctrine that all that exists is continuous in the development of the universe and consequently of the human subject that inhabits it. Dialogism and otherness account for the logic of synechism, continuity, but also for the driving forces exerted in evolutionary processes by discontinuity, chaos, inexactitude, uncertainty, unascertainability and fallibilism (CP 1.172). And while the dialogic relation between self and other is described as a crucial condition for evolution in the creative process – both the other from self and the other of self, as Emmanuel Levinas (1961, 1972) so clearly explains –, another major and correlate force described as most firing creativity is love, that is, the force of agape.

The most advanced developments in reason and knowledge are achieved through the creative power of reasonableness, governed by the forces of agapasm. Reasonableness is endowed with the power of transforming the self's horror of the stranger, the alien, the self's fear of the other (understood as the fear one experiences of the other foreign to self) into attraction for the other, into listening and hospitality towards the other.

According to Peirce, love is directed to the concrete, and not to abstractions; towards one's neighbour, not necessarily in a spatial sense, locally, but in the sense of affinity, a person "we live near [...] in life and feeling". Love is a driving force in logical procedure characterized in terms of abduction, iconicity, and creativity. In accord with Peirce's interpretation of St. John, the development of mind occurs largely through the power of love. Agape understood as orientation towards the absolute other, even care for the other is capable of transforming the hateful into the loveable. The type of evolution foreseen by synechism, the principle of continuity, is evolution through the agency of love:

Everybody can see that the statement of St. John is the formula of an evolutionary philosophy, which teaches that growth comes only from love, from I will not say self-sacrifice, but from the ardent impulse to fulfill another's highest impulse. [...] It is not dealing out cold justice to the circle of my ideas that I can make them grow, but by cherishing and tending them as I would the flowers in my garden. The philosophy we draw from John's gospel is that this is the way mind develops; and as for the cosmos, only so far as it yet is mind, and so has life, is it capable of further evolution. Love, recognizing germs of loveliness in the hateful, gradually warms it into life, and makes it lovely. That is the sort of evolution which every careful student of my essay "The Law of Mind" must see that synechism calls for. (CP 6.289, 1893)

Peirce polemically contrasts the "Gospel of Christ", where progress is achieved through a relation of sympathy among neighbours, with the "Gospel of greed" which reflects the dominant ideology of his day and encourages the individual to assert its own rights and interests, its own individuality or egoistic identity over the other (CP 6.294). On Peirce's account, Charles Darwin's *The Origin of Species* (1859), with its concepts of natural selection, survival of the fittest, struggle for existence, translates this conception of the individual from political economy to the life sciences, from economic development to the development of the living organism. Peirce himself chose the agapastic theory of evolution, and in fact considered his own strong attraction for this doctrine as possible proof of its validity (CP 6.295).

Recalling Henry James, Peirce distinguished between self-love, which is directed towards another insofar as that other is identical to self, and creative love, which is directed towards

what is completely different, even “hostile and negative” with respect to self, towards the other as “absolutely other”, as Levinas would say (cfr. Ponzio 2006b). We could propose a typology of love measured in terms of the logic of otherness, on a scale that moves from high degrees of identity to high degrees of alterity. But truly creative love, as both Welby and Peirce argue, is love regulated by the logic of otherness, love for the other, directed at the other insofar as that other is absolutely other, significant on its own account, *per sé*. The logic of otherness is agapastic logic. Peirce defines love as “the impulse projecting creations into independency and drawing them into harmony” (CP 6.288).

Developing Peirce’s discourse in the direction of Levinas’ philosophy of the self, love transforms fear of the other, in other words, fear provoked in self by the other, into fear for the other, for the other’s safety, to the point of becoming wholly responsible for the other, of taking the blame for all the wrongs that the other is subjected to. Love, reasonableness, and creativity are all grounded in the logic of otherness and dialogism and together move the evolutionary dynamics of semiosis. And given the unique, species-specific capacity as so-called “semiotic animals” (Deely, Petrilli, Ponzio), human beings are also invested with a major role in terms of responsibility towards semiosis generally, that is, towards life in all its forms over the entire planet.

From our own point of view, this approach is oriented “semioethically” to embrace questions traditionally pertaining to ethics, aesthetics, and ideology. *Semioethics* extends its gaze beyond the logico-cognitive boundaries of semiotics to focus on the relation of signs to values, therefore on the axiological dimension of sign activity, which includes the human disposition for evaluation, critique, creativity and responsibility (cf. Petrilli and Ponzio 2003, 2010). This orientation is somehow prefigured by *significs* – the term Victoria Welby chose for her approach to the theory of sign ad meaning and special focus on the problem of “significance”, therefore, on the relation of signs to values (see Petrilli 2009, 2015). The expression “semioethics” indicates the human disposition for evaluation, the value conferred upon something, the pertinence, signifying potential, and significance of human behaviour, participation in the life of signs not only on the cognitive and logical level, but also interconnectedly in corporeal, emotional, pragmatic and ethical terms.

SOCIAL DESIGN AND ETHICS IN PEIRCE'S PHILOSOPHY

Abstract

Social design, developed in the 1970s with a focus on social inclusion and environment preservation, has an ethical concern about its practices. Based on Peirce's pragmatism and semiotics, this article discusses how the products of design necessarily entail practical consequences when they become existences in the world. It also investigates whether all design projects, and not only social design projects, have a social implication. Since semiotics is based on ethics, as described in Peirce's divisions of sciences, and the products of design are signs, Peircean philosophy is an important theoretical background for designers' awareness of their responsibility in the world.

1. The emergence of Social Design

The first contributions and concerns about social inclusion and preservation of the environment emerged in the 1970s and had Austrian Victor Papanek (1923–1998) as one of its precursors. He proposed that design, instead of simply targeting the economic interests of the market, should meet the needs of social groups under the principles of citizenship and ethics, creating opportunities for development. Another issue addressed by Papanek referred to the role of the designer and the industry in general, also co-responsible for the critical situation related to the

environment. The author (Papanek 1977: 66) found, even at that time, that the nearly 75% of the world population living in poverty, hunger and need would undoubtedly occupy more time in the tight schedule of designer teams. But not only did the emerging and developing countries have specific needs but developed countries also had them.

More recently, according to Margolin and Margolin (2002), social products are already produced for the market, even without reaching the required levels capable of meeting demands completely. This reality differs from that experienced in the 1970s, when Papanek considered that socially responsible designers should be dissociated from the commercial market, which ended up limiting the options of these professionals. According to Tackara (2008:12–13), there is also a search for the revaluation of what people are capable of doing, even if we are still experiencing the industrial age. In Brazil, for example, there are interesting cases of groups which, through a reserve of social and cultural resources, generate new ideas to meet their needs. This new reality can be seen as a promising situation of social and environmental innovation, with design interventions and/or contributions from public and private institutions and companies.

Since environmental concerns have emerged in parallel with social ones, for over 40 years, their trajectory has been characterized by a learning process that aimed to avoid the risks related to these areas, or at least to reduce them (Manzini 2008:42). The idea is to develop actions that promote the reduction of energy and materials consumption, while people develop their daily activities and interact with each other. One example is the sharing of resources and the exchange of products in systems that exist especially in poor countries, such as India (Tackara 2008:31–34).

The awakening of a social and environmental consciousness in the 1970s can be understood as a consequence of the economic crisis that occurred in the same decade (Harvey 2007:135), which made clear the failure of the capitalist economic system. The growth method of producers was based on encouraging consumption as a way to drain the mass production of goods. Planned obsolescence was no longer shortening the life cycle of products just through the use of less durable materials but also by changing their aesthetic aspect: fashion styles determined that an object of design, even in good working order, was no longer appropriate for the user when it was aesthetically outdated. Designers, subject to the laws of the market, practiced design with objectives related to obtaining profit for the contractors without considering other variables. But the exhaustion of raw materials, consequence of the extraction result for a production in exponential growth, and the increase in social inequality signaled the need to rethink the parameters of design projects.

Ethical concern is something inherent in social design, because it was established as one of its founding bases. Having as theoretical reference the philosophy of the American Charles Sanders Peirce, which includes his pragmatism, his semiotics and his divisions of sciences, this article seeks to understand how there is an ethical implication in the design process, from the initial projective phase to the use of products in society.

2. Design in the light of Peirce's ideas

The philosopher, in his pragmatist line, understood that there is a link between thought and action, between belief and conduct (Peirce 1877). For him, belief is a state of tranquility which we do not wish to leave, while doubt is a state of dissatisfaction from which we fight to escape, trying to come back to belief. When it breaks up a belief, doubt encourages us to seek a new one, because it is what will keep us prepared to act when the occasion requires. For Peirce, therefore, our actions are the manifestation of our ideas, because beliefs “[...] guide our desires and shape our actions” (Peirce 1877:4).

The philosopher understood that there are two worlds: an inner world and an outer one,

which are not opposed, but adjacent. Thoughts, concepts and beliefs populate the inner side, while conduct and actions inhabit the outside. These two sides are not separate, because the understanding that thoughts and beliefs are externalized in actions and behaviors which, in turn, can be internalized again in concepts, leads to an understanding that there is a continuity between these two worlds. According to Peirce, there is a movement of constant externalization and internalization, even because we can only see the world in its externality. For him (CP-8144), it is only the outside world that we observe directly. Because of that, what goes on inside can be only known if it is reflected in external objects. Thus, the inside should be externalized to become known and exist. For example, one can only know a thought of a person if he/she expresses it in words or acts; otherwise, it will keep unreachable in its interiority.

Another important theoretical framework of Peirce's pragmatism is the idea of "practical consequences" that can be understood as "experiential consequences" (Ibri 2000:33). According to Peirce, the concept can be only known through its effect on the experience, since it is in the experience that it appears from the outside. Within this perspective, one can understand the actions and decisions of designers as the external aspect of their thoughts, as well as pragmatically understand the products of design as the embodiment of the abstract concepts expressed in the briefing¹. At the moment of creation, the designer must choose between them any color options, textures, shapes, sizes, materials, among other qualities, in order to determine a new product that meets the needs and desires of the target consumer. In the projectual phase, the designer is still only dealing with potentialities to translate the concepts into existences, which can generate perceptual stimuli that reach the consumer. This first stage of conception can therefore be regarded as belonging to an inner world full of ideation. However, in order to grant autonomy to the idealized product so it can become an existence, this potentiality should be defined and externalized in its production stage, when the concept will gain real shape, color, texture. Consumers who come across a product of design can infer by its configuration what concepts generated it, since it is nothing but a representative sign of a brand or company.

This continuity between the inner and outer world in Peircean philosophy, different from a notion of duality, is also apparent in the semiotics of the American thinker, who understands the sign as a triad (CP, 1.480). The sign consists of something that is in the place of another, its object, and that has an effect on the interpreting mind, an interpretant. We can understand the products of design as signs that represent the concepts defined in the briefing, whether they are concepts of the product or concepts of a brand (Ponte 2012). The final products generated in the production that will be consumed can be seen as nothing less than the embodiment of internal ideas in the external world that will generate effects in the minds of their users. These effects, in turn, will be internalized by consumers as signs (interpretants are more developed signs), because, after their projects and production, these products will have their own existence in the world, being part of a semiotic process in society, generating effects in an infinite semiosis.

Thus, this semiotic and pragmatic process of materialization of ideas always entails practical consequences: 1) in the establishment of new social forms by adding new products to the market that will alter habits of conduct (e.g. the remarkable transformation that has occurred in human communication since the creation of cellphones), 2) in the choice of materials used in projects (the extraction of raw materials can impact the environment, if not minimized by sustained actions, such as the use of forestry trees for the manufacture of paper; or the use of materials which do not decompose quickly can also affect the environment at the end of their life cycle), 3) in

¹ Briefing is the first document generated after a meeting between designer and client, in which the relevant information about the new job is described, for example: the objective of the new product or service, the strategies of the company, the target, the needs of the consumer etc.

the design of the manufacturing process of the products (the way the project is designed as a process can provide better utilization of inputs in order to avoid waste), 4) and in the establishment of the life cycle of the design object (the short duration of use can increase disposal and create a difficult problem to solve: what should be done with so much garbage? As we can see, each designer's choice about many different variables in each stage of design activity necessarily impacts the world by generating practical consequences.

In the division of sciences proposed by Peirce, semiotics is founded on ethics, which, in turn, is based on aesthetics (CP, 1.281). The latter, for the philosopher, consists in seeking the admirable, while ethics consists of the best conducts required to achieve this goal. Semiotics, therefore, in its relations of mediating meanings, must be based on ethical conduct aimed at achieve the admirable because people are capable of programming their future conduct, ie. human beings can generalize their experiences, mediating them. Therefore, semiotics studies the laws of formation and evolution of thought in order to achieve the aesthetic ideal through a controlled ethical conduct.

Analysing the division of sciences, according to Peirce's conception, one can see that design, understood as a semiotic phenomenon, should be guided by ethics and ethics, in turn, by aesthetics. The idea that any semiotic process generates practical consequences is clearly understandable in the Peircean pragmatic thought, since it understands conducts and actions as the external side of ideas and concepts. The creation of design products – representative existences/signs of concepts – is part of a semiotic evolution that generates effects on interpreting minds (interpretants). These effects carry in themselves consequences in many aspects of the world such as those listed before. In the projectual stage, each choice made by the designer in relation to the product that he/she is developing necessarily impact on social relations, since design products, as signs, can be seen as mediators which consumers use to solve problems in their lives.

3. Conclusion

Retrospectively, the emergence of social design can be seen only as the realization of the ethical necessity after the recognition of the negative impact that design provokes when done unconsciously. What this article aims to discuss is whether, in fact, any design project, and not just those enrolled in the field of social design, carries a social implication because of its semiotic nature. Whether it is practiced consciously or unconsciously, the resulting objects carry practical implications when products become existences in the world. Therefore, it is important that designers start to become aware of such practical consequences in their projects which, materialized, will gain autonomy and continue generating interpretants in a growing process.

As human beings endowed with rational thought, we have the ability to control our behavior and therefore it is pointless to remain in ignorance of the consequences of our actions, which are nothing more than expressions of our thinking. Any designer, conscious creator of signs/existences, although not active in the area of social design, should also be aware of the practical consequences of their projects which will gain their own existence and autonomy in the world when materialized, generating interpretants (more developed signs) in a process of growth and complexity. Although most designers are subjected to the laws of the market in a capitalist world, it is possible to design an object and be conscious of its impact.

We believe that Peirce's philosophy can be an important theoretical tool to contribute to this awareness and we hope that the evolution of these signs (products of design) can generate beneficial practical consequences for society as a whole.

HEGEL'S SEMIOTIC FUTURE: BEYOND THE END OF ART

William D. Melaney
American University in Cairo, Egypt
wmelaney@aucegypt.edu

Abstract

Without contesting the validity of dialectics to Hegel's system, I plan to show how Hegel attempts to appropriate the decisive and irreversible aspects of Romantic ideology in four moves that indicate the "semiotic turn" that typifies his contribution to philosophical aesthetics. The four moves that enable me to read Hegel as an early master of semiotics are grounded in a hermeneutical conception of how the work of art displaces the classical moment that is usually assumed to constitute the core of his aesthetic theory, which is often used to relegate his reflections on modern art to the periphery of his thought. My conclusion is that Hegel's profound ambiguity with regard to the classic is an indication that all was not well in his progressive historicism. But rather than simply argue that this ambiguity is a matter of inconsistency or a structural error, I argue that Hegel's aesthetics can be read on its own, rather than in a totalizing context, as an early example of semiotic thinking that invites us to translate the ascendancy of sign over symbol as a displacement of intuitive fullness in favor of a more "conceptual" but also less controllable proliferation of cultural signs.

Hegel's ambiguous attitude toward the development of art in the modern age complicates his contribution to aesthetics, which has been canonized as "classical" in the strong sense. My dispute with the canonical reading takes issue with the retrospective approach to Hegel's understanding of art and with received interpretations of the "end of art" thesis with which his position

is identified. In this paper, I plan to show that Hegel attempts to appropriate the irreversible aspects of Romantic aesthetics in four ways: (i) Hegel radicalizes Kantian aesthetics on the basis of a basically textual approach to sublime experience that opens up the question of community as a philosophical one; (ii) without demoting classical conceptions of art, Hegel privileges Romantic conceptions that demonstrate the ascendancy of sign over symbol in a spiraling chain; (iii) Hegel laments the fate of art in the triumph of Romantic subjectivism but also suggests how communities can reconstitute themselves on the horizon of aesthetic dissolution; so that, finally, (iv) art can be reconceived as an emancipatory adventure that redefines metaphysics through its historical unfolding as an unending series of semiotic transformations.

1. Hegel and sublime art

A careful reading of the *Critique of Judgment* demonstrates the essential modernity of Kant's response to the problem of reconciling these two conflicting aims. In transforming beauty into a symbol of morality, Kant points back to the originality of Platonic metaphysics and also opens a new path that would be traveled by the Romantic generation that followed him (Kant 2000:248–52). Beauty in the Kantian framework is not reducible to cognitive considerations but involves a process of reflection that enables the subject to assess the aesthetic object through considerations of feeling, which are irreducible to logical considerations (61). From another standpoint, if the experience of beauty refers to a realm of moral value that transcends the senses altogether, it also registers the difference between a world of pure reason and a more limited world that cannot exclude the otherness of nature. The role of the sublime in this dual system would be problematic to the degree that it marked the threshold of moral Reason. Kant distinguishes the mathematical from the dynamical sublime in the Second Book of the *Critique of Judgment*, but, on a more basic level, remarks on how the judgment of the beautiful refers the imagination to cognition, whereas the judgment of the sublime refers this same faculty to the Ideas the Reason (117).

Hegel confronts the problematic features of Kant's apotheosis of nature, while also radicalizing its aesthetic potential. The advantage of Kant's symbolic conception of beauty is that it offered an account of aesthetic experience that potentially harmonized the opposition between universal and particular in a disinterested community of spectators. And yet, aesthetic harmony becomes difficult to maintain at the exact moment that sublime experience enters into the construction of moral identity. Sublimity in transcendental aesthetics can be the prelude to reverence for the law and acquires ethical significance when it carries perception to a new phase of inwardness. This very movement threatens to invalidate the aesthetic framework itself. Hegel's response to this dilemma is to redefine sublime experience in order to restore its underlying unity but, at the same time, to reground this experience in an intersubjective setting that would allow the possibility of community to be given a new shape and form.

While clearly indebted to Kant, Hegel's view of the sublime suggests a 'radicalization' of what emerged as a sign of nature in previous aesthetic theory. The waterfall at the edge of the forest, the view of the Alps from a majestic height and the avalanche of snow on a deserted plain are sublime in different ways, but these three examples place the aesthetic subject in a limit condition that can be preparatory for ethical reconstitution. From Hegel's standpoint, however, the problem with such examples is that they import the weight of external nature into the ethical domain itself. Hegel recognizes the degree to which any natural residue can rebound as a *fatality* in the general economy of aesthetic experience. Hence, rather than threaten the value of the sublime with the possibility of crumbling under the burden of sheer otherness, Hegel transposes this same value into a human setting in which language performs the crucial role in healing the

break between spirit and nature that opened up in Kantian versions of the sublime.¹

This crucial reorientation enables Hegel to place the sublime in a new aesthetic context just as it allows him to introduce a specifically religious thematic into what would otherwise emerge as a purely literary event. First, Hegel strongly identifies sublime experience with the *symbolic* work of art in which substance predominates over concept in an unstable disequilibrium of forces. Thus, instead of standing in for the point of contact between the actual thing and the thing represented, the symbol in Hegel's dialectical presentation of aesthetics would have its home in a relatively early phase in the history of art. Nonetheless, in Hegel's system, the sublime also registers this distance in a manner that shows how the spirit has begun to liberate itself from the most oppressive aspects of material dominance. The experience of the sublime enables substance to achieve independence from finitude through a process of inwardization that involves freedom from nature. This process is described as involving religious intuition: "Only through this intuition of the being of God as the purely spiritual and imageless, contrasted with the mundane and natural, is spirit completely wrested from nature and sense and released from existence in the finite." (Hegel 1975, 1: 371).

Hegel emphasizes the role of monotheism in this manifestation of the sublime in describing the poetry of medieval Persia but more strongly in citing Hebrew scripture, where the birth of light is achieved through a divine utterance and the mind is elevated through a lyric appropriation of sovereign power. The situation of the human individual in the biblical tradition is nonetheless fraught with uncertainty. The human believer comes to view himself as unworthy before God and expresses this sense of unworthiness in cries of pain and passionate outbursts of grief, but the believer also establishes an affirmative relationship to God that is based on "righteousness and adherence to the law" and provides an internal criterion for self-assessment" (377). This division needs to be thought through philosophically so that that the distance between the finite believer and the infinite God no longer restricts us to an endless oscillation between two separate spheres of being.

2. Sublimity and romantic art

Both Kant and Hegel attempt to show that sublimity entails division and cannot provide stability to an aesthetic realm that is ancillary to a higher state of being that resolves tensions along moral or religious lines. Nonetheless, we might identify Hegel's crucial departure with his use of *religious writing* as the key to transforming the meaning of sublimity into a concern for the individual's communal existence, since the text that communicates sublime experience has now become a shared one. In contrast, Kant's version of the sublime offers a road that could be deceptive in the long run due to the manner that it provides an insecure basis for ethical life. In Kant's philosophy, the universality of aesthetic experience is not clearly preserved in sublime feeling, which signals a crisis in the unity of the aesthetic subject. On the other hand, although Hegel calls attention to how the subject is limited by external factors in sublime experience, his evocation of the sublime text places the conflict between spiritual independence and impersonal fate in a decisively interpretive context.

In Hegel's aesthetic theory, the divided nature of symbolic expression is what precipitates a new artistic phase in which the opposition between substance and concept can be resolved in favor of philosophical unity. Hegel often speaks glowingly of how this basic opposition is resolved in classical art, particularly Greek sculpture, which represents an achievement of adequacy

¹ Jean-Francois Lyotard's contention that various philosophical positions are more or less reducible to "phrase regimes" is strongly applicable to Hegel, who seeks to recover the linguistic core of sublime experience. Lyotard tends to read Hegel as exemplifying a totalizing use of Reason, but speculative thought at least has the merit of releasing the Self from the conditions of fixity, which promote a kind of wandering that is not bound to the rules of any one language game (1988: 91–97).

that is only achieved when neither term in this basic opposition is excessive to the other one. The positive value assigned to ideal adequacy explains why Hegel is sometimes identified with an extreme form of aesthetic classicism. And yet, much of what he has to say about Greco-Roman antiquity is merely historical rather than the basis for a normative conception of the classical work of art. The role of self-reflection is crucial in establishing a ground for what is best in the classical tradition, and the notion of aesthetic adequacy partakes of a particular moment in art history when adequacy was possible to achieve. Nonetheless, Hegel's account of the dissolution of the classical work of art provides us with insights into why the Greco-Roman world was incapable of providing the basis for a new and higher phase in aesthetic development. Echoing Plato's rational theology, Hegel observes how the gods of antiquity are drawn into the struggles of the finite world and "become involved in a contradiction between their grandeur and dignity and the beauty of their existent embodiment," thus reducing them to a field of arbitrary conduct (503).

This contradiction is clearly demonstrated in sculptural works that could be located in religious settings, which display a certain lifelessness, lack of feeling and the quiet trait of mourning: "It is this mourning which already constitutes their fate because it shows that something higher stands above them, and that a transition is necessary from their existence as particulars to their universal unity" (503). Again the contradiction between an abstract and indeterminate fate and particular existence is what underlies the capricious entanglement of the gods in the affairs of mortals. In short, Hegel attributes the dissolution of the classical form of art to contradictions that are introduced from the religious sphere and cannot be resolved in the domain of culture alone. For this very reason, we might even say that the religious sphere explodes the classical totality and its apotheosis of ideal form as an external force that requires a new aesthetic constellation in order to provide art itself with a further justification.

The emergence of the romantic work of art is therefore a necessary event when considered in terms of a contradiction that can only be resolved if the classical model can be diminished or subverted. The equilibrium between concept and substance that prevails in the classical work of art is only temporary. At the same time, while the pre-classical work of art remains embedded in substance to a degree that occludes its subjective meaning, romantic art connotes a process of inwardization in which the Idea continually overshadows material embodiment. Thus, Hegel can argue that "there is something higher than the beautiful appearance of spirit in its immediate sensuous shape, even if this shape be created by spirit as adequate to itself" (517). The unification that occurs in classical art does not disclose "the true essence of spirit," so that the totality of the Ideal dissolves into subjective being and external appearance before the spirit can pass through this rift to attain "a deeper reconciliation in its own element of inwardness" (518).

What Hegel calls romantic art, therefore, should not be identified with unique cultural manifestations in the fields of music, literature and painting that mark his own period. While it is true that medieval-modern art is romantic in a manner that cannot be detached from a general chronology, Hegel might easily discover signs of romanticism in art that exceeds this historical framework. A crucial assertion of dialectical aesthetics, however, is that the content of art cannot be judged on its own but in relation to an ongoing process that introduces the possibility of contradiction into the unity of the work as an aesthetic object. Contradiction may not be evident in the case of classical art, but the moment of truce may be little more than an illusion in an ongoing movement that cannot be interrupted by the momentary solace of harmony and equilibrium. It would seem, therefore, that Hegel's classicism is largely undermined as soon as the temporality of the aesthetic is given its due as a constitutive feature of what must be acknowledged as soon as the work of art is approached in dialectical terms.

Temporality pervades both aesthetic experience and the formation of art in a manner that raises the question of how it can remain a distinctive feature of the dialectical process. On the

other hand, when the temporal nature of the dialectical process opposes the classical modality that assumes historical form in Greco-Roman art, aesthetic experience runs the risk of losing its distinctive unity. The spirit of reconciliation that animates romantic art brings about a momentary truce, but it testifies to a heightened subjectivity that threatens to undermine the impressive cultural gains that follow the classical age. Hegel locates the origins of romantic art in a religious attitude that enables infinite subjectivity to emerge from itself and *in a relation to an other* that allows it to remain at one with itself: "Therefore the romantic Ideal expresses a relation to another spiritual being which is bound up with depth of feeling that only in this other does the soul achieve this intimacy with itself." (533). In time, however, the religious domain in which romantic art originates yields to an increasingly secular mentality that re-establishes the division between inner and outer. The role of subjective inwardness in chivalric romance, Shakespearean drama and Romantic fiction ultimately leads to the dissolution of romantic art, which collapses in a world in which "what was so magnificently sung, what so freely expressed, has been expressed; these are materials, ways of looking at them and treating them which have been sung once and for all" (608).

3. Hegel's thesis of art at an end

Hegel's widely cited remark that art is at an end can be interpreted in terms of both the history of art and the movement from aesthetics to semiotics, broadly considered. Hegel does not attribute the decline of art to the unique behavior of the artist, who "stands within the world of reflection and its relations" and has become too much a part of "our whole spiritual culture" to remain impervious to its demands (13). On the contrary, we learn that it is only in the long view and in a dialectical sense that our present situation can be reasonably assessed: "In all these respects art, considered in its highest vocation, is and remains for us a thing of the past." (11). What this means is that art, as the basis for expressing *the highest levels of human thought*, is threatened increasingly by a triumphant modernity that no longer requires or favors the reconciliation of sign and substance. Thus, on one level, Hegel's statement seems to imply that art as such is no longer capable of anticipating and contributing to intellectual developments of the highest order. We might reinterpret this as saying that art in its classical form is outmoded to the degree that it no longer reflects the phenomenological unity that seals the meaning of aesthetic perfection. This would imply that art's intellectual significance is exhausted in the post-classical epoch, which is overburdened on the level of the concept and therefore has lost the capacity to give form and shape to what animates it spiritually.

However, the end of art, if examined dialectically, has another significance that allows artistic meaning to be transformed according to conceptual, that is to say, philosophical, criteria. Romantic art may have dissolved historically, but it also paves the way to the future in calling attention to the dynamic process through which the mind outpaces all forms of aesthetic embodiment as it moves forward in time. The development of the concept moves inexorably from symbol to sign and thus opens up the possibility of a comprehensive semiotic in which all forms of aesthetic embodiment can be translated into 'historical' terms. Such a semiotic would presuppose an intellectual community that would, in some respects, resemble Kant's *sensus communis*, but the difference between the two communities might be expressed in the difference between Kant's eighteenth-century heritage, which enabled him to identify transcendental beauty with stability and consensus, and Hegel's post-Romantic aesthetic position, which situated absolute knowing as immanent to the historical unfolding of Reason.²

2 Kant's belief in a *sensus communis* is integral to his aesthetic theory has been interpreted as implicitly political in Arendt's reading of the *Critique of Judgment* (Kant 2000: 92–97; Arendt 1992: 67, 70–72). Hegel's classicism evokes harmony and concord, and then risks losing ideal unity when sign and substance diverge once and for all. But art for Hegel would have

From this second standpoint, romantic art would open up the possibility of a new phase in our spiritual history whereby the most advanced communities can be enriched and sustained through the protracted event of art's dissolution. This final outcome of Hegel's aesthetics would not be inconsistent with the general tenor of his thought. We learned previously that each major phase in cultural history springs forth against a religious background that nourishes a specific mode of art, whether symbolic, classical or romantic, until the community that founded it can no longer sustain what it made possible. At this point, order is reconstituted as contradictions are resolved in different ways and according to different conceptions of the absolute spirit. Clearly, the process of reconstitution that would follow the dissolution of romantic art would remain something of a mystery only because we are living through that moment ourselves. Nonetheless, Hegel provided us with the tools for imagining what future community could salvage humankind from the wreckage of the romantic work of art, which in the end might become less of a catastrophe than an opportunity for growth and development, pointing beyond to a form of shared life that would be highly improvisatory.

Nonetheless, the semiotic turn that Hegel's aesthetics anticipates can be viewed with regard to both a dialectical theory of the linguistic sign and in relation to the broader history of aesthetics. Jacques Derrida has discussed how semiology is crucial to both Hegel's philosophy of consciousness and to the dialectical logic that undergirds the phenomenological edifice. In this regard, the distinction between symbol and sign is indicative of a displacement of nature that looks forward to Ferdinand de Saussure's well-known structuralist thesis concerning the arbitrary features of the (linguistic) sign. Derrida remarks that a "relationship of absolute alterity distinguishes the sign from the symbol," whereas "a mimetic or analogical participation" characterizes the relationship between the symbol and the symbolized (1982: 84). Moreover, Derrida also insists that "the place of semiology is really at the center, and not in the margins or the appendix, of Hegel's *Logic*" (71).

The distinction between sign and symbol indicates the importance of negativity to the dialectical movement that pervades aesthetics in general. Hence, in overthrowing the Sphinx, Oedipus demonstrates how the massive creature who is half man and half animal, still deeply rooted in nature, gives way to the human being who solves problems and displays a lucid intelligence that is characteristic of a species that is no longer locked in instinctual reactions. Derrida notes that Hegel astutely connects semiotics and psychology when "the production of signs manifests a freedom of spirit" (87). Nonetheless, Hegel also argues in favor of the importance of this transition as a thoroughgoing historicist when he traces the movement from East to West as inexorable, thus forgetting the sporadic nature of a break that must repeat itself unceasingly and cannot in good faith be institutionalized as uniquely Western.

In order to perceive things anew and to liberate them from the mundane world in which they are encased, we need to reject a model of reality that simply turns the Infinite into a separate domain that lies beyond the finite plane of existence. Within the context of this ambitious project, Hegel's aesthetic theory resumes a political meaning that can be traced to the aftermath of the French Revolution, when his own thought was still in formation, just as it seems to turn away from engagement in the practical sense. In this sense, the end of art does not amount to the exhaustion of promises but coincides with a new manner of appropriating "the restlessness of the negative" and to the persistence of aesthetic internalization (Nancy 2002: 3–7). The end of art that Hegel identifies with an inner movement that is immanent in the historical process is

a place in the ethical world of the modern State, even if its conceptual role were greatly curtailed. We might argue that both views of the public sphere, as either the site of aesthetic accomplishment or as a special realm that supported art as an ideal institution, are complementary. It should be noted, however, that the Hegelian rapprochement of art and politics is just as precarious as Kant's attempt to contain a sense of the sublime in an aesthetic that is threatened by its overwhelming power.

also indefinitely prolonged in the textualization of the sublime that introduces the possibility of in-finite interpretation. A radicalization of Hegel's attempt to bring Heaven to Earth is therefore implicit in his aesthetic theory to the degree that inwardization can be conceived, or perhaps reconceived, as a condition of semiotic deferral that prevents interpretation from achieving temporal closure. In such a situation, the semiotic movement that lies at the heart of the dialectical process can be said to coincide in its essential features with the future of art.

4. Semiotics and the future of art

Hegel's pronouncement on the end of art is often considered to have been premature, not only from the perspective of the art that was crucial to his own time but also in terms of the emergence of late Romanticism, European Symbolism and the flowering of the avant-gardes that occurred in the twentieth century. However, the apparent classicism of this pronouncement can also be re-contextualized as an utterance that casts light on Hegel's early response to the French Revolution as a signal event of modernity but also as one that recreated on its own terms the Greek notion of a public space in which human beings can enjoy a sense of community and solidarity as equals who are no longer bound to the division between inner and outer that beset previous social arrangements. My argument here is not that Hegel interpreted the French Revolution as classical in the way that Greek art brought together sign and substance, but that like many other young German intellectuals of this tumultuous period, Hegel already thought of himself as *living after* a momentous time upon which he chose to reflect and in relation to which his own early meta-political reflections are already an idealization of history, rather than an attempt to explain and evaluate what actually happened.

We can easily relate the early Hegel's enthusiasm for political transformation to the emergence of aesthetics the strong sense, particularly in the work of Friedrich Schiller, who lives in the wake of Kant and provides a philosophical response to a revolutionary situation. The immature Hellenism that allowed Hegel to turn a modern event into a semi-classical one fades in his later work, but the experience of living in the aftermath of this event is one that he shared with his contemporaries. In truth, modern aesthetics owes its origins to the outcome of the first political revolution in modern Europe. Jacques Rancière has discussed how Kant's notion of free play, which performs an aesthetic role in the apprehension of beauty, can be related to the need to surpass the harsh rule of law that instituted itself during the height of the French Revolution. Schiller, however, was even clearer than Kant about the theoretical importance of developing aesthetic categories in the wake of the Terror, which "still adhered to the model according to which an active intellectual faculty constrains passive sensible materiality" (Rancière 2009: 32). Schiller's response to this situation was published in 1795 as *Über die Ästhetische Erziehung des Menschen*, a philosophical treatise that adopts Kant as its starting point but, in the third and concluding section, suggests to Rancière how mankind can adopt an aesthetic viewpoint on matter as "the reflection of its own activity" (36).

Hegel's reading of Schiller was crucial to the development of his own conception of dialectics, which adapted the idea of negation (*Aufhebung*) whereby "the intervention of some new and independent faculty" constitutes the sole basis for bridging the gulf that separates passive and active determination: "Thought is the spontaneous act of this absolute faculty," Schiller writes (1982: 130/131). Schiller explains that the apotheosis of feeling that strongly insists on the dynamic nature of beauty is formally opposed to the method of the intellect that strives to maintain the coherence of beauty on a conceptual level. However, there is also a "middle state" between sensuality and reason, passive and active sense, according to which "both these conditions totally disappear in a third without leaving any trace of division behind in the whole that has been made" (124/125). This third condition is the work of negation, which Julia Kristeva has

identified with the “fourth term of the dialectic,” the semiotic principle that cancels difference and allows difference to be preserved (1984: 109, 133). Art is this movement in which the *agon* between sign and substance is temporarily abated in the epochal configurations of Spirit.

In conclusion, what first emerged in the sphere of Greek political life as the principle of mutuality and was extended during the French Revolution to include all men acquires a distinctively aesthetic cast in Post-Romantic culture when the work of art breaks up, at least partially, due to the onslaught of ‘modern ideas’ and the intellectual frenzy that accompanies the dematerialization of art objects. When viewed from another standpoint, however, this same progressive loosening, if not debasement, can be interpreted as a *breaking free* in which the challenge to traditional metaphysics is taken to new heights, that is to say, beyond the position that it achieved during the Age of Enlightenment. When Hegel’s aesthetics is transformed from a limited conclusion within a complete system into a series of questions concerning the role of interpretation in a process that continually outpaces itself, we finally arrive at the semiotic condition that both guarantees the productive unfolding of meanings and allows art in all its forms to perpetually recreate the horizon of its own transcendence.

Abstract

This paper proposes a brief discussion about the terms tradition, innovation and their relation with time. Contemporary languages require some adjustments to our lifestyles that involve perceiving things of everyday life in order to adapt to the idea that we have the time. We will use the concept of semiosis, from Charles Sanders Peirce's semiotic and philosophic theories, and the concept of language proposed by Lev Semenovitch Vygotsky to try to understand the process of interpretants of the time.

“The symbolic order characteristic of the human species, of which language is inseparable, paved the way for the creation of a new kingdom in the biosphere, the realm signs and culture.¹”

Lucia Santaella

We start this paper discarding all that nostalgia that can somehow transpire or tangent the text. We will discuss terms that are in our everyday; things that we speak and use on a regular basis, even why we are constructed by language and the verbal language is the one that most will try to mediate our thinking and our action. We will try to start a discussion about the terms Tradition and Innovation. We think that the great link between these two terms is characterized by the notion of time. And time, a preoccupation that comes since philosophy is philosophy, is

¹ Free translation.

an issue that is gaining more followers for its thoughtfulness. To speak about tradition and innovation it is necessary that we put the following question: does technology change the time? If we think about time – as Charles Sanders Peirce taught us – as inseparable from language, and language as signs, these are loaded by time. Therefore, the action of the sign, or semiosis, is “... coextensive with the notion of thought, mind, learning and continuity²” (Santaella, 2013, p.11). Then it is a pregnancy of the time in all actions. Time is continuous and leaves traces, tips for what lies ahead. Understanding tradition as the transfer of values, beliefs and practices to every generation, and innovation as something that is apparently new, which brings news, information and “improvements” in some systems, maybe we will not be able to read these terms as independents from each other. Innovation comes from a tradition. Comes from a need that is already contained in the universe of the experience of who proposes that, the newness, the freshness of an idea, in fact, already contains signs that are constantly reevaluated. It is this current that we intend henceforth take our discussion, to understand this semiosis as “...synonymous of intelligence, continuity, growth and life.³” (Santaella et Nöth, 2004, p.157). How important, then, the Charles Sanders Peirce theory of signs is for the understanding of time? It is necessary, here, resorting to his *phaneroscopia* or phenomenology, that Lucia Santaella (2004, p.2), very clearly defines as:

... a quasi-science that investigates the ways we apprehend anything that comes to our mind, anything of any type, something as simple as smell, a formation of clouds in the sky, the sound of rain, a picture in a magazine, etc., or something more complex like a more abstract concept, the memory of a time lived, etc., in short, everything that presents itself to the mind.⁴

For Peirce, there are three and only three formal elements that constitute any phenomenon. He called them Firstness, Secondness and Thirdness.

Firstness appears in everything related with chance, possibility, quality, feeling, originality, freedom, and monad. Secondness is linked to ideas of dependency, determination, duality, action and reaction, here and now, conflict, surprise, doubt. Thirdness concerns the generality, continuity, growth, and intelligence. The simplest form of Thirdness, according to Peirce, manifests itself in the sign, since the sign is a first (something that presents itself to the mind), linking a second (what the sign indicates, refers or represents) to a third (the effect that the sign will provoke in a possible interpreter).⁵ (Santaella, 2004, p.7)

But what does it all have to do with time? If, as mentioned above, time for Peirce is continuity, semiosis, or action of the sign, to form an interpretive signic network must necessarily be connected to the previous signs which produce interpretants that enable the “formation” of other signs that produce interpretants again and so on, *ad infinitum*, in a continuous current in direction not necessarily linear, however, focused on a future pregnant with the past, an undefined

⁵ Free translation.

future, but that carries a tendency to continuity. The present will be expressed in a discontinuous singular moment, in a *hic et nunc*, but a present that is no longer a present, because it must be embodied in something to exist, that is, the unique time that a Firstness element finds matter (moment of Secondness), offers its qualities and find there a body, shifts in a time and space to make possible in an intellectual synthesis (Thirdness) an encounter in a cognitive act made by an interpreting mind according to its interpretative competence, in a logical thought, then becoming Thirdness, largely responsible for all continuity and the action that the sign will carry on its interpreter. So, semiosis occurs in time and is constituted by time. Signs that come from past are loaded by numerous possibilities for multiple meanings that “match” to the future the power to determinate new sign elements that will draw, for example, the communication processes, without which life would have no chance of walking, growing, multiplying, existing. We may not forget, however, that Thirdness only happens in function of Secondness and Firstness, fundamental categories for the dynamics of semiosis itself.

Backing to the terms tradition and innovation, it is possible to perceive that time is involved in all of it, because when we appeal to tradition to see ourselves on it or to extract parameters to innovation, we are actually trying to work with signs that are there and that will offer us new directions insofar as from them it is possible to indicate the necessary paths to another way of acquiring skills whether facilitating or making practical. In the field of communication this is no different. Contemporary communication technologies are here to witness the way that this field has been touring and the consequences arising from this movement; for us today, so fast and almost imperceptible.

Imagine, for example, the time that used to take the famous letters that Peirce sent from United States, via sea, to Lady Victoria Welby⁶, to reach the European continent where she lived. Also the time took by the answers by Lady Welby for Peirce. However, this was not a hindrance so they could communicate and exchange their experience. They were, this time, using languages and technological resources of that time, better explaining, they were using signic and technological resources available so far. And when we talk about signic resources we want to think any and all modes of action of translated languages that are available to us and which of them we are made up. “Language is not in us. It is us who are in the language⁷” (Peirce *apud* Santaella, 2004, p.63), used to say Peirce. When we are born we find languages ready, it behooves us to assimilate then and contribute to their growth. And what languages are we talking about? We are talking about all signical forms we can establish to be possible for us to communicate, to be possible to learn things and understand others, to be possible act our thoughts.

In the fourth edition of the work *Thought and Language* (2011) from Vigotsky, a Soviet psychologist (1896–1934), Jerome Bruner in his introduction of this edition (p.IX) leaves us a very important passage that is worth quoting it:

...Vigotsky elaborates in what sense he believes that dominating nature we can master ourselves. Because it is the internalization of the manifested action that makes the thought and, particularly, it is the internalization of the exterior dialogue that takes the powerful tool of language to influence the flow of thought. The man, so to speak, is modeled by instruments and tools used, and neither the mind nor the hand alone can accomplish much.⁸

⁶ Victoria Lady Welby (1837-1912), self-taught philosopher of the English language, visual artist and musician with whom Peirce shared some of his studies.

⁷ Free translation.

⁸ Free translation.

In fact, we are not isolated beings and we could not live in this state of isolation. I only exist because the other exists and allow me to exist. We expand our interpretative skills as we live and share our experiences. To acquire interpretative competence means increasing our signic repertoire for our action to aim, every more, a more harmonious coexistence, more salutary and more egalitarian. Unfortunately it is not always like this, but if we not aim the *summon bonun* what sense would have life?

Societies are increasingly connected by communication networks and, consequently, increasingly complex. In order to understand all these fast transformations, science – which can be defined as a combination of inter-subject areas (interdisciplinarity) – develops an essential role. To science focus lies in understanding the changes and make use of it, the most ethical possible.

The digital era is showing us the plot and the great complexity of relations in all sectors of knowledge and our everyday lives. A complexity that makes us think our world even more guided by technological advances. Technology implies change, what today gain a speed almost unreachable. To understand the changes is to reinterpret languages, it is to understand its access channels, it is to be adapted to the understanding of what time represents. It is to try to understand that new languages produce new forms of action. These new forms of action – that feed on the signs of the past – implies in new types of knowledge that are proposed to us and that it behooves us to improve them, work them, understand them and disseminate them. This is the role of all.

Discussions are many; interests, maybe bigger, but it is impossible to deny that the ways that are presented us everyday represent a challenge of trying to understand what life is offering us. To innovate is to make contemporary technologies our theory tools and utilities for a world more equal. Nothing on it is new. The role of technologies has being always this. However, it is not worth, in the name of it, to make use for ulterior and inhuman purposes. Repeating, to understand contemporary languages, the new technologies, is to try to understand life, life in its *lato sensu*.

But time? “Composer of fate, drum of all rhythms...”⁹

St. Augustine’s time, Kant’s time, Peirce’s time, Foucault’s time, Einstein’s time. What is this time we search and live? It is the same time of always. The time of the things in the things of the time. A time that is shown us the one we (re)interpret. A time that with the use of contemporary technological resources we can even “short” it, also shorting our distances. Always questioning it, but never obtaining complete answers. Answers that only depend on us. Only depend on our interpretation of things.

ALBUM COVERS: DISCOVERING BRAZILIAN LIFE UNDER MILITARY DICTATORSHIP

Eduardo A. Dieb
Faculdade Cásper Líbero, São Paulo, Brazil
edudieb@gmail.com

Abstract

Brazil lived under military dictatorship from 1964 to 1985. The censorship was fierce and the freedom of speech too limited. At the dictatorship's final period, in Sao Paulo city, Brazilian biggest city and cultural pole, some musical groups and artists of many areas began to trace open critics to the government and to the situation they were living. This movement was called as "Vanguarda Paulista" (Paulista Vanguard), and those who were part of it had a strong political and social sense, besides the esthetic preoccupations. "Língua de Trapo" was a group of this movement, and they became quickly known not only due to their acid lyrics, but also due to their humanistic and liberal look, perceptible in the critics to the social behavior. Humor had always been present in the compositions and performances of the group that tried to talk about themes such as political freedom, sexual orientations, urban violence and censorship in a different way of those who were known as "singers of protest". The humorous and critic spirit of the group appeared in the cover of the albums and, if it was read as a text, it could show a Brazilian portrait in a particularly important moment of the country's contemporaneous history. This paper presents a brief frame of Brazilian political situation in the mentioned period, the artistic production of "Língua de Trapo" and how their album covers were already showing a political, ideological and artistic positioning. Reading the image as a complex text in order to analyze and to interpret Brazilian's socio-historical context will enable to understand the language and the messages in the album covers of "Língua de Trapo" and show a group worried to mark not only a contemporaneous esthetic but also their own political positioning in a very troubled time for Brazilian life. This study is based on theoretical concepts and texts from authors such as Guy

Debord (Society of the Spectacle), Adorno and Horkheimer (Cultural Industries) and Michel Foucault.

The musical group *Língua de Trapo* was one of the exponents of the self-called *Vanguarda Paulista*, artistic movement in São Paulo city in the late 1970s and during the 1980s. The group's music and his performance on stage were mocking political and social criticism in the final period of the Brazilian dictatorship. At a time when censorship still had strength, dealing with sensitive issues such as education, marginalized child or sexuality could lead to problems for artists.

The social criticism, political positioning and the way of the band look to the facts of life came from the critical view of its components. Using not only the songs, but the covers of albums, the group could pass political messages and depicting the moment that was lived in Brazil.

Knowing the social and political profile of a society at a given time is the basis for understanding the cultural production of this society. For his unique style of blending humor, and political and social criticism, and have originated from a vanguard movement, the *Língua de Trapo* has never been a successful name in the mainstream, remaining outside the music business.

Guy Debord's *Society of The Spectacle* (1997), helps to understand the media coverage and the everyday life. The group used parody in his music production, a style widely discussed by Fredric Jameson (1996). The discussion about the Culture Industry is based on works by key authors such as Adorno and Horkheimer, which helps us to contextualize the subject studied here.

From dictatorship to opening: the stage for the show starts to be mounted

On March 31, 1964, Brazil went to sleep as a democratic state under the rule of civilian President João Goulart and waked up on April 1 under a military dictatorship. The long period of exception lasted until the indirect election of Tancredo Neves in 1985. Brazilians were prohibited from voting directly for governor until 1982 and for President until 1989. The return to democracy began in the government of General João Baptista Figueiredo (1979-1985), with the amnesty and the restoration of multiparty system. Communist parties remained prohibited.

Military dictators have used every trick to maintaining power, including the censorship of news and political and cultural manifestations. The gates of hell were opened by the Institutional Act number 5, which overlapped the national and state constitutions, strengthened the hardliners and gave absolute power to the military regime. Brazilians were gagged and cannot speak, dull because they could not hear and blind, unable to see anything beyond what pleased the military dictators.

Cultural life also suffered direct persecution, both by censorship (milder between 1964 and 1968, absolute thereafter), which prevented the free expression of ideas and the arts, as the physical repression set in prisons and torture. After 1968, any criticism of the dictatorship was taken as a subversive and communist attitude, and therefore, liable to punishment (Ridenti, 2005, p.72). At the end of his performance, coinciding with the end of dictatorship, censorship was tested, and sometimes ignored by artists who appeared at the same time that Brazil began to return to democracy. In 1985, the conditions for the flourishing of new political and cultural settings were launched, and some already arose in the Brazilian horizon.

At the time, Brazilian Popular Music (MPB) lived in a comfortable complacency setting with big names turning into sacred cows, consecrated already becoming gods and an occasional composer / singer doing almost sealed letters of protest, because of censorship."The ways of Brazilian music were very grim: the labels were absolutely closed to anything that would indicate renewal or, at least, were extremely remote from Sao Paulo scene" says Wilson Souto Jr., owner of the space that would be known as the cradle of *Vanguarda Paulista*, the *Lira Paulistana* (Alexandre, 2002, p.42).

Certain musical groups from this scene started getting gigs more often and drew public attention, from critics and also the “pachydermic music industry that came out of hibernation and began to suspect that something happened in the cultural underworld of Sao Paulo” according Nasi, lead singer of IRA!, contemporary band from Vanguarda Paulista. (Beting, 2012, p.78).

It is part of the culture industry logic holds the absolute control of the production of the music industry, with an eye on profit, capturing popular cultural events and turning them into salable products. “Do-it-yourself” was one of the slogans of the punk movement, that is, do not wait others to do for you. This meant seeking new ways to record and disseminates the songs themselves, without depending on major labels and their standardized systems.

In Brazil the years 1980, MPB was self-indulgent and autophagy, sterile (Dapieve, 1995), in fault of the military regime and elites holding political and economic power and the consequent imposition of the dominant culture (Tinhorão, 1990). To be different had to get away from the standard. To record an LP, it was necessary to devise alternatives. You had to get away from the mainstream, turn your back to the record companies, commercial radio, the powerful Globo TV network and its plastic novelties. The little room for independent bands was possible thanks to the college radio, separated from the major labels and without the worry of producing a profit for their owners.

The new counterculture should be against the military regime, show new values, breaking with the MPB. The speech was the non-speech, lift something new from the collapse than existed before (Alexandre, 2002). Unlike the musical movements until then, the artists of Vanguarda Paulista approached the divergence in dislike of the reigning sameness. The similarity between them was an aesthetic concern and an absence of formal ways. There was only one consciousness to do something different from what was already absorbed by the industry.

There is a direct relationship between cultural production and the capitalist economic output, as this allows the projection of the laws of the market to the field of production and dissemination of popular music (Tinhorão, 1990).

But there is a filter in the cultural industry that allows only the groups or artists linked to large companies, or sponsored by them artistically, access to mass media such as radio and television, making it virtually impossible for independent artists and groups to stick this block. What is heard in the mass media is not the authentic taste popular, but false, artificial-produced by the holders of the economic and media power.

The culture of defense is not based solely on artists of a certain counterculture movement (Dunn, 2008). Other elements are needed for the rallying cry is heard and perceived socially. The symbolic production (Bourdieu) followed the procedures ever; after all, was guided by a conservative market, averse to independent news. And when something came up independent, was soon co-opted by the same industry.

All production value and meaning of an artistic movement depends on a variety of political actors (end of dictatorship and democracy), social (relationship of the members of Vanguard Paulista), artistic (no new or strong movement in music), producers (had to get away from the major record labels to show something different), critical (almost always aware of what happens around you) and consumers (the public was unhappy with the MPB).

In a scenario full of domination in the production and dissemination, and by extension, cultural and social control, the Rag language sought to show that it was possible a new form of musical expression. The Brazil in the late 1970s and early 1980s lived the agony of a dictatorial period. Musical movements of importance no longer prevailed. The company wanted political, economic and social changes. The stage was set for the show.

The Vanguarda Paulista and *Língua de Trapo*: São Paulo's songs

The Vanguarda Paulista had an innovative and challenging attitude to popular music. It was an interconnected group, but independent, artists, writers and musicians who lived in São Paulo. Categories such as avant-garde, alternative, independent and marginal are used to refer to a generation that has established in São Paulo and produced from the town (Oliveira, 2002, p.61).

São Paulo universities were barns talent and always appeared groups that were soon performing in São Paulo night. From Journalism course at the Faculty Casper Libero came, in 1979, the Laert Sarrumor & os Cumplices. With the entry of other students, as Guca Domenico, Antonio and Carlos Mello, the group was soon renamed *Língua de Trapo* (as whisperous, a popular expression in Brazil). The choice fell on the name Ari Barroso's song "Dá Nela" (beat her) because the so rag language spoke ill of everything and everyone around you.

The songs were pretentiously serious, but the group itself did not take him seriously. At shows the use of political humor in the lyrics generated identification with the public, because the historical moment of Brazil was conducive to this kind of music. The source of inspiration were the things of everyday life, society itself with its habits and bad habits, politicians and their actions, often suspected. The band tried to pick on everyone, using humor as a weapon to complaints that can laugh generate transformations in society at the time. The musical production of the group is composed of the following discography:

- *Língua de trapo* (1982);
- *Sem indiretas* (1984);
- *Como é bom ser punk* (1985);
- *Dezessete big golden hits super quentes mais vendidos do momento* (1986);
- *Brincando com fogo* (1991);
- *Língua ao vivo* (1995);
- *Vinte e um anos na estrada* (2000);
- *Vinte e um anos na estrada – DVD* (2000)

***Língua de Trapo* and the cultural industry**

The cultural industry, with the domain and the exploitation of mass media by financial, common groups in capitalist countries, democratic or even exclusively by the government in countries with closed political system, it generates a uniform cultural events. What is displayed can only be so if it is within the standard of those in power. "The whole world is forced to pass through the filter of the cultural industry" (Adorno, Horkheimer, 1985, p.118).

Thus, artistic productions such as movies, novels, texts and music go through an ideological sieve. The State and individuals controlling the mass media impose their ideology. And time also for marketing sieve, specifically in cases where the control of disclosure belongs to the private sector. In both cases, "even the aesthetic manifestations of opposite voltage dence policies sing the same praise of the steel rate" (Adorno, Horkheimer, 1985, p.113).

To break this pattern we must dare, build alternatives and try to conquer space to display their own artistic and cultural production, often an uphill battle and condemned from birth to defeat. For those who are not part of the mainstream, any artistic production outside the ghetto itself and conveyed, spread through the culture industry apparatus, whether on the radio, on television or in newspapers and magazines of high circulation, is only part of "an ideology intended to legitimize the trash that intentionally produce" (Adorno, Horkheimer, 1985, p.114).

In this view, all that is produced or aired by the culture industry lacks proper artistic value, it is not cultural event. To be served, automatically becomes part of the system. What displays and reports are then pasteurized products because they are harmless, and equal, not bring anything new. "The relentless drive attest cultural industry unit training policy" (Adorno, Horkheimer, 1985, p.116).

There was, as today is noticeable, a movement or a proto-movement to promote aesthetic and political changes in Brazil, which at that time spent by the military dictatorship of transition to democracy. And there was, above all, an attempt to escape the artistic and aesthetic uniformity that is striking feature of the cultural industry, where songs, artists and shows are repeated infinitely, varying only the form, not the content (Adorno; Horkheimer, 1985).

The search for new styles and forms of artistic expression outside the mainstream just offering the very culture industry a source of new material, and, through a process of assimilation and control, allows the continuous exercise of domination and perpetuate this domination. The aesthetic and artistic breaking claim of the vanguards ends just feeding what you wanted to destroy. As much as the ideological pretensions of artists are evident, that his works are imbued with aesthetic concepts, artistic or political opposite to the dominant pattern, “as recorded in its difference by the culture industry, he (the artist) now belongs to it as well as the participant of agrarian reform to capitalism” (Adorno; Horkheimer, 1985. p.123).

The artist also passes through the filter of cultural industry (Adorno; Horkheimer, 1985, p.123), otherwise it will be virtually impossible to survive the production of his work without some kind of marketing, without consideration for the assignment of an artistic production or it is shelter, patronage or money. To not give up their artistic concepts or parts of them, to be inflexible, the artist is condemned to ostracism media and eternal stay in the shade and the lack of recognition by the mass. Offers an oblation to the marginal gods, but never surrender to industrial god.

If slightly flexible to appear and be accepted by the culture industry, the artist is branded as sold by their peers. However, if it does not, get the marginal image of the system. If this insertion in the cultural industry is made independently of his will to participate in disclosure, or to see their proper work by others, the artist himself becomes part of what before criticizing, which used to be excluded (Adorno; Horkheimer, 1985).

Albums covers

In some of his songs, using unusual image constructions, absurd or funny situations, the *Língua de Trapo* makes use of something “legitimate in folk art, farce and buffoonery” as Adorno and Horkheimer (1985, p.129) in an attempt to, through laughter, cause a political debate, denouncing through the farcical something that is explicit, but is not seen in society.

“We laughed about the fact that there is nothing to laugh about” (Adorno, Horkheimer, 1985, p.131). We laughed because we are placed in the position of observers something that showed and did not see. Laughed the equivalence of historical characters, the courage to use a historical fact and pain that occurred there, as we laugh, mainly by discovering ignorant of our present. We laughed our own ridiculous. True joy is a serious thing (*res severe gaudium verum*). Laughter helps to break the reality, changing customs, thoughts change, to become more critical to perceive situations from another angle (Adorno, Horkheimer, 1985).

Every album cover image is taken as a social text and can be read as such, with the name of the band, and the disc of the images used. The image (and, by analogy, the album cover) is a social practice of producing texts that arise within social practices in which we engage, within the social institutions in which we live (Foucault, 1969).

The use of images in music production – in this case, the albums covers – has a force that should not be neglected as it is the first consumer identification with the product (vinyl, CD or DVD) released by the artist. A needy time information often mutilated by censorship, image album cover offered (and still offers) a quick way to understand the spirit of a musical work or the message that the band wants to show.

Figure 1 – “*Sem Indiretas*”

(No Indirects – reference to the indirect election of the President of Brazil)

The compact “*Sem Indiretas*” (Figure 1), with two songs live from the eponymous show, use the yellow, the official color of the Direct Elections Now movement. The red stripe on the top left of the cover art highlights that it is a live disc recorded. The band’s name appears written as if it had been spray-painted on a wall with dripping paint each letter. The letter U symbolizes a language and was spelled in red. This image refers to political graffiti that at that time abounded in walls throughout São Paulo, in phrases like “Down with the Dictatorship”, “We want democracy” and the most famous of all, “Direct Elections Now”.

The components of the band appear in caricatures designed, with each taking one character. These cartoons, far from childish the band, show the sense of humor that was already trademarked the group and how they took the characters that appeared in their songs live. In front of everyone, like a stripe of censorship, the band with the name of the show and the album “*Sem indiretas*” reference to the political moment that the country was with the group giving their support to the movement for elections direct to the President and the end of the Electoral College.

Figure 2. “*Como é bom ser punk*” (It’s good to be punk)

The group used on the cover Ladies Concert at the Philharmonic Hall framework, by the Venetian painter Francesco Guardi, painted in 1782 and currently exposed in the *Alte Pinakothek* in Munich. This represents a party hosted by the Austrian court to the Russian nobles visiting Vienna.

The album cover is composed of a thick red band and a thinner yellow that frame the painting. The band's name appears above all the elements. And between the name and the ballroom chandelier (focal point frame) appears the disk name: It's good to be punk. The word punk is written in red and seems to have been graphitized because around for ink splatters and his spelling was made irregularly. Shows some strength and aggressiveness, in contrast to the mild and calm environment of the frame.

The punk movement shocked traditionalists by the speed of the music, the themes and the visual aspect of his followers. Nothing more traditional and conservative than life in a court. The cover shows how would a visual contrast between the rigid court life with a punk presence, through word of graffiti on the board. The punk movement in Brazil was at its peak in 1985, while in Europe begins to take the first signs of exhaustion.

The visual joke album cover end up gaining more strength by hearing the homonymous song, in which a punk who works as an office boy sings his difficulties through a parody of opera singing.

Pastiche and parody or sameness and creativity?

Postmodernism: the cultural logic of late capitalism (1996), by Fredric Jameson, allows us to discuss of parody and pastiche of concepts in contemporary society, illustrating the various ways you can understand artistic events that occurred in the late 1970s and for much part of the 1980s in São Paulo. The period in which the dictatorship and censorship were in full force can be known today as the time of pastiche and the simulacrum to the musical art world, although this pastiche scenario can also be recognized today. The strong presence of the heavy hand of censorship was something that all artists should count, therefore, for a work to be shown on television, theater or cinema, for a song to be recorded to disc, played on the radio and concerts, approval was required Department of Censorship of the Federal Police. And what was contrary to mainstream thinking, produced by critics of the dictatorship, or fleeing the standards imposed by the censorship was summarily banned.

There was thus the artistic standardization, with the annulment of the individual subject and its creative manifestations, predominantly repeat artistic and musical styles. In addition to censorship, the desire to succeed was an important factor (and still is) the emergence of "new" singers and groups that simply repeated in style and content, without really anything new to offer. It is a sad combination of artistic censorship with political and moral motivations with the strength of the cultural industry.

Pasteurization of art caused by the artistic production within the logic of the culture industry, quickly becomes the main artistic events in a gray and indistinct panel, where what prevails is not the creativity and, yes, the accommodation of the artists chewed formulas and repeated that can ensure more profitability for the least cost to the holders of the means of production. "The autonomy of works of art, which, it is true, almost never existed in pure form and that has been marked by causal connections, you see, ultimately, abolished by the culture industry" (Adorno, 1994, p.93).

This relentless pursuit of standardization of artistic works results in a high degree of dissatisfaction in those who are excluded from disclosing media artwork and own mass art production chain. One of the ways to earn a place in the sun and show their work is to opt for independent production and dissemination, knowing beforehand be impossible to compete on the same level

with artists, musicians, singers and groups sponsored by the cultural industry, with radio stations, television and large record labels. It is the most extensive and complete dependence and servitude. "The compensatory satisfaction that the cultural industry offers to people, to awaken in them the comfortable feeling that the world is in order, frustrates them in their own happiness she deceptively gives them" (Adorno, 1994, p.9).

The ubiquity of the cultural industry almost impossible the formation of autonomous individuals, independent and, therefore, critical. These guys are the precondition of democracy, which never existed or would have survival guarantees the absence of independent thinkers and critics of cultural industry (Adorno, 1994, p.99).

Promoters of marketed fun wash their hands when they state that they are giving the masses what they want. This is an appropriate ideology for commercial purposes: the less the mass can discriminate, the greater the possibility of selling indiscriminately cultural items (Adorno, 1994, p.136).

The text section "About popular music," by Adorno, helps you understand how strong and damaging the conjunction of cultural industry with a totalitarian regime in capitalist societies. This switches to cultural industry not only in favor of capital development, but also as disclosing the dominant political thought.

By focusing on lack of reasoning of a population that accepts without blinking, for convenience or fear of retaliation, any artistic or cultural events that are imposed, the government of a dictatorial regime seeks ways to impose their "taste" and the musical aesthetic population. It does this through the commercial interests of the cultural industry. Those who do not pray for official booklet, or, in this case, do not sing the official sheet music, automatically staying to the disclosure system edge through radio and commercial television stations, surviving only through local shows with reduced public and sale tiny runs of LPs or cassette tapes produced alternatively.

What is the path used by Rag language with their album covers, music and lyrics to face the military dictatorship and the cultural industry? Parody against pastiche, the mood against violence, free thought against dogma. The intolerance towards the standard. Against dependence and servitude, freedom and liberty.

Pastiche, such as parody, is imitate a style, a mimic coarse, repetitive and not creative because creativity requires freedom to be able to create, not plastered and standards. It is a dead expression, like a statue without eyes. Have parody serves to provoke laughter, to embarrass or honor. "Pastiche does not have life or the mood of a parody, because it lends itself to provide information required for a more critical pension censing from the observation of what has been parodied" (Jameson, 2000, p.44).

What capitalist society produces is pastiche, a mere imitation of artistic styles in several industrialized artistic events. It is an almost eternal repetition, dull and creativity, artistic events that at some point had a glimpse of innovation, but were absorbed by capitalist society (Jameson, 2000). The way to denounce the artistic sameness, pastiche that reigned in MPB and the social and political problems experienced in Brazil during the study period was the parody lyrics and musical styles, and the images used on the albums covers.

Freedom of choice of musical rhythms shows how much the group valued artistic freedom and political independence. In a disc of the band can be heard *moda de viola*, hard rock, bolero, reggae, *xote* and parody of Italian music. And the lyrics do not spare political parties, business, government and religions. Commented acidly about everything and everyone.

This imitation, pastiche, again, is not as parody. Are different in essence and in its acts. They differ in purpose and function. While the parody is used to laugh, exaggerating features of particular work, manifestation or artistic style and thus enabling a discussion of the provocation

made, pastiche lacks critical sense.

Just try to play through mimesis, qualities or characteristics of certain artistic works, making the play by play, headless and uncritical, with the intention of no longer a just and yes, also earn some money and another that is the same as the market. “The pastiche is the simulacrum of an artistic work, it lacks originality and aura, being identical copy of something whose original never existed” (Jameson, 2000, p.45).

Reinforcing the hypothesis of creative empty pastiche of artistic expressions coming from a consumer society, Guy Debord states that “the image will be the final form of reification,” since the most important thing seems to be rather than being. This seems to be, no matter individual artistic value, but the value that particular artistic expression is replaced by look, to resemble other artistic expression. This manifestation, in turn, came from a simulation of another manifestation, perpetuating the pastiche as is the work of Sisyphus, never ending and always produces the same result, condemned to eternal repetition.

By this time being dominated by pastiches and simulations, the last time tends to disappear from the historical memory of a society, as the pastiche reproduces itself, not allowing innovations.

Língua de Trapo was critical in its time, which confirms that “there is more engaging historical relic than the music of certain periods” (Wisnik, 1982, p.15). Songs with critical content, most often using humor and parody to show what the group saw as wrong. Errors that persist in haunt our daily lives, even after so many years, after the dictatorship and six presidents of the Republic elected by direct vote of the Brazilians.

Abstract

The contiguity existent among intermediatic immediate objects becomes clearer in contemporaneity, showing the importance to study these signs of the time today. Several technological artifacts that own different functions and dynamizations are available, for example, the interactivity enabled by the relation between videogames and Kinect (first named as Project Natal): a motion sensor of great importance at some science areas for bringing complexities never known before.

Therefore, this paper aims to explore the universe of the immediate object taken at the spheres of the technological esthetics given by the relation of Kinect + videogame, demonstrating part of the perceptive and cognitive process in the intermedia relation observed. Then, also showing how a part of the perceptive process contains temporary events incorporated in given spaces by technological artifacts. This analysis will be based on the deployments made by Lúcia Santaella, specifically in the books *Applied Semiotics* (2002) and *Liquid Languages at the Mobile Age* (2007) that show with emphasis a detailed critical analysis about the themes to be explored.

1. Introduction

The Kinect, for sure, revolutionized the technological sphere and the interaction between the users and the games. With an unique composition, beyond breaking the sedentary paradigms and ignore the joystick use in their games, it brought benefits not only for the games scope – area which was designated – but also for medicine, with treatments that goes from physiotherapy to

stroke patients, for the robotics revolution, for the pedagogical scope and even for the archaeological researches.

This accessory that was created by the Brazilian Alex Kipman with the goal of helping the users of Xbox platform was nominated by Guinness World Records the electronic artifact with the fastest selling of the history, impressing the Microsoft's executives.

This article will analyze the semiotic composition inside the games universe which uses this mentioned technology, in regarding of the interpretation questions and the perception of the signs. The analysis is going to approach the subject based on the phenomenological theory of Charles Sanders Peirce and also based on the dissertation and statements of Lúcia Santaella.

In this way, the immediate object's universe will be explored inside the technological spheres given by the relation of Kinect and videogame, approaching the perceptive and cognitive process in the relation of the intermedia observed, since the process is continuous and the semiotic creates a need of reading about itself.

2. Technological evolution

The coming of Kinect wasn't a random situation, but the result of a technological advance allowed through the years. The technology that we know and was possibly unimagined a few years ago, is given by the technological revolution of the twentieth century (XX). Beside and entailed by it, a vast control over the image. "The unquestionable domain of the images is due to the fact that the technological revolution has put an enormous apparatus to the vision service that you can't deny that the twentieth century (XX) was the century of the technovision triumph." (Santaella, 2007:259)

Then, we should understand the evolutionary character of the technologies, mainly those ones which influenced the studying and the confection of current ones, basing on the evolutionary line showed by Santaella in the "*Liquid Languages at the Mobile Age*" book, due to the Weibel theory:

- (a) The invention of photography with automation that it brought to the production of the image was contemporaneous transmitting pictures and words in long distance via scanning (breaking of two-dimensional image into a linear sequence of points in time) with the help of machines. The telegraph, the telephone, the fax, the forerunner of Nipkow television in 1884, and electronic telescope, all contributed to the development of technological systems for the transmission of sound, fixed images and moving images. With this, the imaging was immediately followed by transmission. At the same time, Weibel says, about electromagnetic waves' discovery (Maxwell em 1873, Hertz em 1887) meant the birth of new visual worlds, foreshadowing the advent of telematics culture.
- (b) After a short time the spatial form of the image, as in the painting and the photo, was followed by a temporal form in the movie. From a space environment, the image turned into a temporal environment.
- (c) The discovery of the electron and the cathode ray tube, both in 1879, established the basic conditions for the production and transfer of electronic images, which led to television.
- (d) The magnetic recording of visual signals in 1951, which had been anticipated by recording beeps at the beginning of the twentieth century, combined the film, radio and television in a new channel, the video. The technology of transistors, integrated circuits, chips and semiconductor revolutionized the data process technology in the mid-twentieth century, leading to the production of images completely generated on computers. Later,

the multimedia computers not only united all the historical possibilities of production and transmission of images generated computationally, but also opened up perspectives for interactive visual worlds controlled by the machine. These worlds brought unexpected news: virtuality, variability and viability thanks to the interaction between the information and the user.

(Weibel *apud* Santaella, 2007:259)

With this panorama that is described, we can understand the historical and cultural context of the emerging technologies that messes with the modern world.

3. Kinect

The object of our study, the Kinect (= kinetics), is an accessory for the Xbox video game platform created by the Brazilian Alex Kipman. Primarily known as Project Natal, the device enables the interaction of people with games without them necessarily need to push buttons or use joysticks, then requiring body movements. Soon, we can define the Kinect as a peripheral for body movements and voice capturing that was created with the purpose of enabling the player-game interaction and even player-videogame-player2.

The accessory goes beyond its original meaning. In other words, beyond fulfilling the purpose of helping and entertaining along with the games, the Kinect is also used for body and voice recognition, allowing it to have functions outside the universe of games. For example: to connect the Xbox platform, the individual can access the menu “Applications” by voice control without using any joystick. The same happens when the body recognition is activated on your device’s menu through the continuous movement of the hands, “waving” for the platform. All this can be used for a specific purpose that does not necessarily need to be the act of playing itself, allowing since the act of doing a simple research, till accessing an application with just commands that require specific sensory activities.

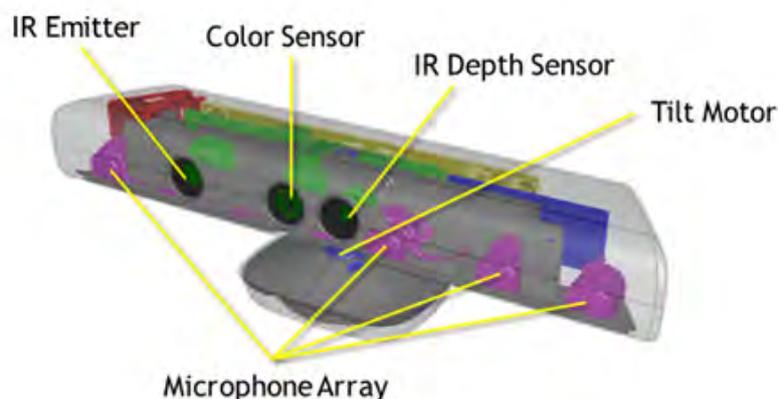

With the wide option of interaction that this peripheral allows, people started using it in unusual ways and it “escapes” from the original purpose, but they don’t stop representing a social-technological revolution, which will be explored later in this article as Kinect Effect.

Therefore, we have the interactive system given by the relation Kinect-user, how this interaction takes place and the whole human sensory system that is necessary for the process to be completed, are included in the scenario of virtual reality.

The virtual reality creates multisensory synthetic scenes, simulated in numerical language configured as data or datascapes landscapes, fully structured by abstract language, which respond to the actions of those who experience them. This produces intense effects on human perception due to the feeling of being truly immersed in a synthetic world. Differently from the e scenes that record the visible reality through devices based on “Visionica” (Virilio 1988), such as cameras, telescopes, satellites, virtual world, according Couchot (2003: 175), is entirely computational and involves completely the viewer’s body. This can change your point of view and move your body under its own command. The immersion happens because, on one hand, the body is equipped with sensory or interfaces devices that extend the sensory field, on the other hand, the environments, which the bodies are connected, are built of three-dimensional computer language qualities, composing landscapes with proprioceptive qualities that replicate spatial situations experienced when we move our bodies in the physical world (Domingues 2004: 37). (Santaella, 2007:274)

3.1. The sensor's features

We can say that Kinect is a highly innovative combination of cameras, microphones and software that transforms the player's body into a video game controller.

There is an innovative tripod that works with the Kinect sensor: video camera, depth sensor and microphone.

Fig. 1: Kinect configuration and composition (Microsoft).

Source: <http://msdn.microsoft.com/en-us/library/jj131033.aspx>.

Color Video Camera VGA (Color Sensor) – This camcorder is for facial recognition and the detection of other features, when detection occurs in three component colors: red, green and blue. This makes capturing of a color image possible.

(IR Depth Sensor and IR Emitter) – The emitter emits infrared light beams and the depth sensor reads the IR beams reflected back to the sensor. The reflected beams are converted into depth information measuring the distance between an object and the sensor. This makes the capturing of a depth image possible.

Voice Detector (Microphone Array) – This is the series of four microphones that can isolate the voices of the players from the noise of the room. It allows players to be a few meters away from the microphone and still use voice controls.

Motorized base (Tilt Motor) – The tilt motor lets you change the slope to + or – 27 degrees, which effectively doubles the volume of the captured field of view. The slope is related to the gravity, rather than being connected to the base of the sensor. An elevation angle of zero indicates that Kinect points perpendicular to gravity.

The detection system of the skeleton is able to “see” up to six bodies – of which only two are active and possible of interaction – and also has the ability to map 48 points of the human body. For everything to work naturally, the player must stand at a distance from 1 to 4 feet of the sensor without obstacles.

3.2.1. Kinect effect

The Kinect was developed by Microsoft to revolutionize the way we play videogame and its entertainment experience, as already discussed in this document.

However, people started using the device in ways never imagined before. The use of this technology that is been studied is plural and diverse, with records from the educational context,

passing through assistance to archaeological researches and going to the operating room, taking Kinect beyond games.

That is what has been termed by Microsoft as “Kinect Effect”: the diversity in the use of peripheral, used in many different ways, bringing new experiences to the world and in a revolutionary way.

That’s why we bring a significant contribution to the understanding of multi plurality view about the usability of the sensor¹.

3.2.2. In archaeology

Students of the California University at San Diego were part of a futuristic archaeological dig in Jordan: a three-dimensional mapping of the soil which helps in accurate location details. Instead of using an expensive and complex system such as LIDAR, the team used Kinect.

Fig. 2: Archeological excavation

Source: <http://www.fastcompany.com/1771025/kinect-hacked-3-d-scanning-archaeology-site>.

After capturing the images, models can be made in 3D and project them in an immersive virtual reality environment. In addition to capturing the images, researchers can also add information about each part of the space.

3.2.3. In the student scope

The interactive learning is fundamental to engage and motivate students in the technologically advanced world of today.

Given by the nature of the digital lives of the students and having in mind their great interest in video games, educators are increasingly using immersive approaches based on games, helping students to develop their essential skills.

In classrooms across the United States, teachers who integrate Kinect into their classes reported tangible improvements in student engagement and learning.

The technology is being used as part of pilot programs underway at the district of Los Angeles Unified School (California), Chicago Public Schools (Illinois), Houston Independent School District (Texas), Scottsdale Unified School District (Arizona), Flagstaff Unified School District

¹ The analysis described here is part of a universe that encompasses the usability of the sensor; only a sample of the factual and the potential use of the same.

(Arizona), Fairfax County Public Schools (Virginia) and Loudoun County Public Schools (Virginia).

3.2.4. In Medicine

A fact to be explored with regard to the use of Kinect in medicine is the case that happened

in Brazil in 2012, the Evangelical Hospital in Londrina, located in Paraná.

Fig. 3: Doctor using the Kinect system instead of using negatoscope at a hospital in Londrina, Paraná (Brazil).

Source: <http://revistadonna.clicrbs.com.br/saude/hospital-desenvolve-tecnologia-com-ferramenta-de-videogame/>.

This was the first Brazilian medical center to develop a method that uses Kinect in operating rooms. The intention was to end with the use of film sheets in the negatoscope, a device with special lighting that assists and enables observation of radiographs. An examination sheet measures approximately 35 cm wide by 45 cm high, and a panel typically hold a maximum of three sheets. In more complex surgeries, it is common to perform the exchange of images numerous times. As the medical team can not touch anything, to avoid contamination, the display of tests was handled by nurses or assistants.

During a conversation with the IT staff of the hospital the context of using the Kinect came out. The professionals started to develop a software that uses the peripheral connected to a PC. With adjustments and repairs over the months, the INTERA emerged – Interaction between man and machine – that allowed safety, agility and dynamism at the access and movement of patient’s radiological images, with the doctor dressed in a sterile manner, without the need to contact the equipment.

4. The Perception by Pierce

After passing through the features, unique composition and usage of our object of study, we can now enter the semiotic question.

Order to understand the process in which the interaction takes place with the Kinect player when referring to the perception of it, we must first understand the theory of the perception of Charles S. Peirce, which is grounded in phenomenology, “a quasi-science that investigates the

ways we apprehend anything that appears to our mind” (Santaella, 2007:02).

Then, the development and analysis of the perceptual and cognitive question given by the relation Kinect user (or gamer), first we must understand the inference relation, reference and interpretation made possible by the sign, as shown in Santaella:

[...] in Charles Sanders Peirce’s definition, the sign is a triadic nature, in other words, it can be analyzed:

- in itself, in its internal properties, in other words, in its power to signify;
- in its reference to what it indicates, refers or represents; and
- in the types of effects that is able to produce in their receptors, that is, the types of interpretation that it has the potential to awaken in their users.

Therefore, the semiotic theory allows us to penetrate the inner movement of the messages itself, in how they are engendered, procedures and resources it used. (Santaella, 2007: 5)

With this, knowing that “sign is anything of any kind that represents something else” (Santaella, 2012:8), now, we can analyze here in semiotic terms as the process of signification is given in the relation user = Kinect.

5. Percept, *Percipuum* and Proprioception

Then appears to us the following question: how a perception that contextualizes the process of human interaction within systems that make up the universe of virtual reality is given? In other words, there is no interaction without the possibility of knowledge of interactive human being for their overall self-representation in body terms.

For this, we must begin the research process based on the Peirce’s perception theory.

The theoretician identifies and characterizes two former terms of the perceptual process that is distinguished by its characteristics: the percept and the *percipuum*.

To understand the percept, we must resort to what is external to us and presented through the perceptual process, it can only be understood through a judgment of perception, and for this last one, we won’t be attentive to a robust analysis. Soon, *percipuum* can be seen as the percept within the boundaries that “our sensors impose” (Santaella, 1998, p. 52). Briefly, the *percipuum* is to the immediate object and the percept is to the dynamic object. Rodrigo Morais gives us a good overview of these terms:

The percept remains independent and external to the mind, while the *percipuum* is found at the judgment of perception, In other words, the percept can be taken as any stimulus that hasn’t had contact with any sensory receptor, while *percipuum* is the percept at the metaphysical moment when processed by a body. (Morais, 2013:32)

For example, the *percipuum* is in the immediate object, in here and now. Is in the representation of something through a space, the sign itself. Therefore, the percept, which is connected directly to the dynamic object, presents itself to perception at a referential, metaphysical moment, the fugacity of the perceptual process.

6. Proprioceptive Question

As already discussed in this article, there is a possibility of interaction between the player and the videogame – that uses Kinect – without having, first, a self-recognition as a whole in tangible and spatial terms. The player acknowledges himself in that realities composition through his own knowledge in relation to his own image.

[...] opening up the understanding field of human recognition through the senses, it is evident that this temporal and spatial self-determination inherent to the construction of reality of each individual is directly connected to the self-image, not only in visuality terms, but understanding the imagery contemplation from synesthesia, from all sensory possibilities concerning the human. (Morais, 2013:25)

This process is enabled by the existence of a proprioceptive system, that promotes precisely this spatial recognition of the body, making its existence be one of the leading factors to the interactive cycle that Kinect searches be completed.

7. Proprioceptive equivalence in Kinect

When facing a complex system that simulates the moves of a body, the person who is interacting, instead of what you may think, doesn't find parallel realities that are separated, in other words, there is a composition of reality that makes this person perceives and interact with the technological composition, having, this complex composition all the immediate object.

With this, the self-perception, the external perception which is given by the interactive moment and the whole context that encompasses the act of playing stands to capture the immediate object.

The biological body that generates the avatar used in the Kinect interactivity can be understood as an equivalent body to the sensory representation given in virtual platforms taken by the technical apparatus analyzed here. That is, given the facts cited about the proprioception, the spatiotemporal self-recognition, it can be seen that the human being has access to itself through representations given by its perceptual possibilities, just as also happens with the body understanding generated from Kinect and projected in other technological advent.

Finally, we understand that the Kinect and all the technological advents today that permeate the contemporary life, open the doors to new studies that show a possibility in multiplicity of identity in the understanding of the human being as its own object of study.

INSTANT COMMUNICATION: A BRIEF HISTORY ABOUT TIME-SPACE COMPRESSION

Liliane Pellegrini
Faculdade Cásper Líbero, São Paulo, Brazil
liliane.pellegrini@gmail.com

Abstract:

The accelerating pace of life and overcoming spatial barriers marked the history of capitalism and that seems to have caused a compression process of the two dimensions (time and space). The phenomenon of compression also reflected in the representation of the world, in a way that the perception of shrinkage experienced throughout history – the once vast world – has been reduced to a global village. This paper intends to comprehend and discuss the transformations of the representation of the world by instant communication and mobility. Therefore, the article discusses the breakdown of the two-way relationship between space and time – brought by Bauman (2000) –, the compression process presented by Harvey (1992).

Fluids or liquids neither fix space nor bind time. They do not have a pre-defined shape and they are constantly ready, and prone, to change it. As explained by Bauman (2000:2) “and so for them it is the flow of time that counts, more than the space they happen to occupy: that space, after all, they fill but ‘for a moment’”. And it is this mobility and inconstancy of fluids that assimilates them to the idea of lightness. In other words, the possibility of moving easier and faster as lighter we travel. (Bauman 2000).

This “liquid-modern” kind of life is a way of living at the liquid modernity presented by Bauman wherein the members act under conditions that change in a shorter time than the necessary for consolidation of habits and routines, also ways of action (Bauman 2009). This means that this society can not remain structured for a long time.

The feeling of living at a liquid atmosphere is what Bauman understands as the essence of the contemporary society. The values we follow and defend are more volatile, as the relations between people and between human being with the world they live in. The search for instantaneity, that marked the humankind for many centuries, continues even more avid. We seek to extinguish the barriers from time and from space. We want everything here and now. And yet, we cannot longer imagine a period when was necessary to wait and to grub carefully the unknown.

1. Time and space dimensions in the contemporary society

According to Bauman (2000), time as a measurable concept, as history, began in modernity. There are some examples in history that searches to explain how the time-space wedlock became two different concepts: the astronomers measuring the velocity and the distances of celestial bodies, or Newton calculating the exact relations between acceleration and the distance passed by the 'physical body', or even Kant, the philosopher, conceiving time and space as "two transcendently separate and mutually independent categories of human cognition" (Bauman 2000:111).

While man used only natural mobility tools, the biunivocal correspondence between time and space dimensions predominated, in a way that "far" and "long", just like "near" and "soon" were used almost as synonyms. In other words, meant the amount of effort applied in order to man walk by a certain distance. The space definition corresponded to the trajectory using resources as the human body or hunt, like riding. Time, on the other hand, was defined according to the necessary duration to travel a given space using the same resources (Bauman 2000).

The development of transportation and communication facilities, during the XIX and XX centuries, represented a rupture factor of this correspondence, due time acceleration. Faster transportation facilities, as train and automobile, reduced time of spatial displacement. Furthermore, innovations in the field of telecommunications, like the telephone and the telegraph, made it possible the immediate contact between interlocutors separated by large distances.

By the time when distance began to depend on employed technology, time acquired features of flexibility and expansiveness as opposed to space, which remained inflexible, in the sense of cannot be straightened, curled and manipulated. Because, unlikely space, the possibility and change from time has made this last component a disruption factor. It was now the dynamic polo on time-space combination.

This rupture sources, however, go back to the Industrial Revolution period, which accelerate the craft production process. The instrumental rationality of capitalism has it basis the elimination of idle and unproductive time, searching ways to accomplish tasks more quickly, and so, maximize value. Time is now a tool focused mainly to win space resistance and, then, became money. Because, as Bauman explains (2000), time shortens the distances and makes it possible to overcome obstacles and old boundaries, as desired by human ambition.

The accelerating pace of life and the overcoming of spatial barriers marked the history of capitalism in such a way that seems to have caused a compression process of the two dimensions:

as space appears to shrink to a 'global village' of telecommunications and a 'spaceship earth' of economic and ecological interdependencies - to use just two familiar and everyday images - and as time horizons shorten to the point where the present is all there is (the world of the schizophrenic), so we have to learn how to cope with an overwhelming sense of time-space compression of our spatial and temporal worlds (Harvey 1992: 240).

The compression phenomenon also reflected in the representation of the world, in a way that was experimented a shrinkage perception throughout history – what was once termed as the world wide, was reduced to a global village. According to Bauman (2000), the community can be considered in these days as “the last relic of the old-time utopias of the good society”. And it was reduced to the size of the nearest neighborhood and is now classified not by its content but by its borders. Harvey (1992) also defends this same idea and shows that transport innovations significantly influenced this change, progressively annihilate space through time, as highlighted by Harvey (1992) in the following figure:

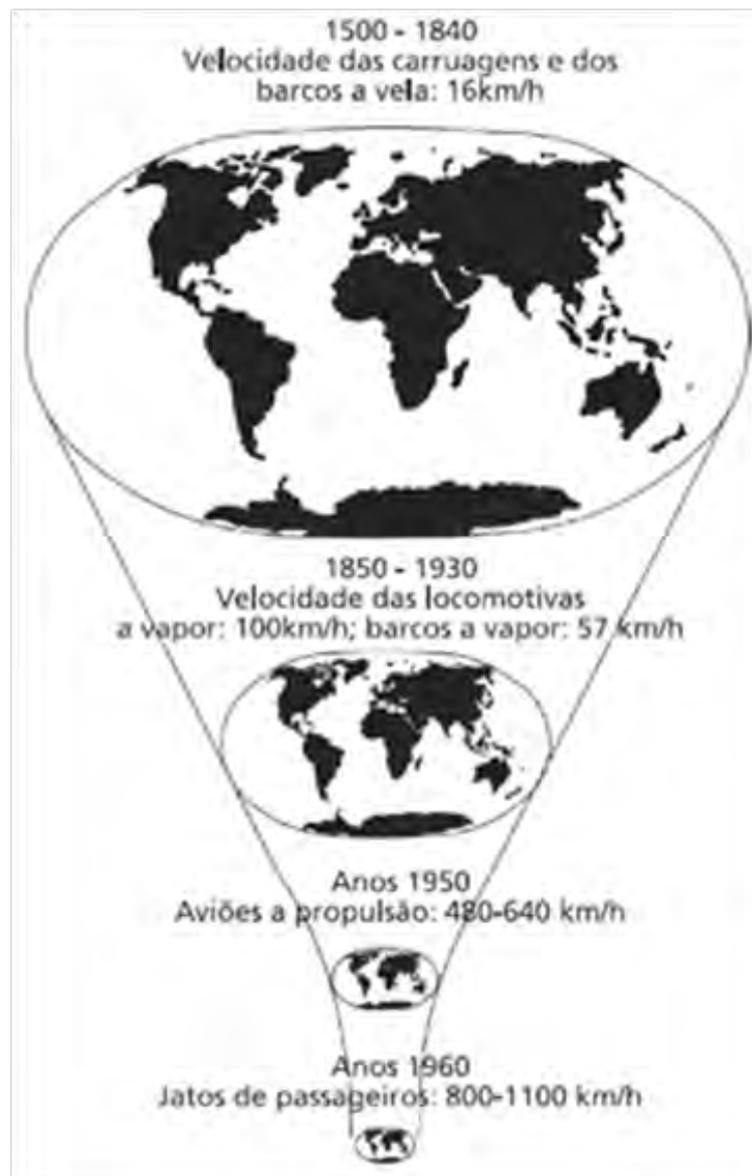

Fig. 1: Representation of the world in four stages.

The funnel-shaped illustration shows the shrinkage of the representation of the world in four stages, relating each one of them to the speed of transportation facilities of the period. The framework developed by the author of this article, coming up, appointing each phase according to the data presented by Harvey (1992) and specifies its duration¹.

Phase	Duration	Fast transportation	Speed
Wide World	350 years	Carriages and sailing boats	16 km/h
World Steam	100 years	Locomotives and boats	100 km/h
Postwar	10 years	Aircraft propulsion	480 – 640 km/h
Global village ²	Current, since 1960	Jets	800 – 1100 km/h

Table 1: Transportation facilities of each period.

The phase named by the author as “Vast World” lasted for a longer period compared to the others: were 350 years in which the representation of the size of the world has not changed significantly. This phase began with the great maritime voyages, resulting, among others factors, in discovery of lands and development of cartography. From the maritime exploration was being built a new world design – vast, however finite, and therefore, possible of be explored to exhaustion. The perception of vastness possibly derived from long transoceanic voyages to access distant continents from Europe.

From the “World Steam” phase, significant technological advances occurred in transportation in the range of about 100 years, until the aviation era, which started in motors for propulsion phase and is current with the jet engines of phase called “Global Village”.

This article does not intend to explore the transformations of each phase profoundly. However, for better understanding of the space-time compression phenomenon, will be presented two examples comparing the correspondence made by crossing the Atlantic Ocean, in different periods and by different kinds of transportation.

The first corresponds to the discovery era, where the vast world was still in the process of being completely unraveled by man (European) due to Iberian nautical science ingenuity. The letter written by Pero Vaz de Caminha to king Dom Manuel sharing news of Brazilian lands discovery, left for Lisbon on May 1, 1500. Due to the secret and confidentiality safeguarded the document at the time, there aren't accurate records of the date the correspondence was received in Portugal, however, it is estimated that was at June 15. The notification of an important political event for that period, certainly treated as priority, took more than forty days to cross the Atlantic Ocean, by the faster transportation and most advanced technology of that time, the Portuguese ship.

The second example refers to the period between the two World Wars, when opened the first

¹ Although navigation and the use of riding and carriages are prior to 1500, the calculation of the length of the table considered this date as the beginning of the period, based on data considered by Harvey (1992).

² The author used the term global village to name the space-time compression phase of the current society, in order to clarify that the speed of transportation and telecommunications tend to shorten distances and reduce the planet to a similar situation of a village: a world in which everyone would be, somehow, interconnected. However, differs from the global village model proposed by McLuhan, which appropriated exclusively to television, a unidirectional mass media to its definition. A village is characterized as a restricted territorial extension in which lives a small population that shares its life story, constituting a common-unity. Thus, communication between village members tend to be bidirectional (as dialogues between two or more individuals) and not unidirectional as the television, in which information is transmitted in a single stream to an unlimited number of potential receptors, without interaction with the sources of origin (no feedback).

aero postal mail between France and South America by the mythic company *Aéropostale*³, famous for performing risk achievements at the time, such as night flights, fly over the Andes and operate the first commercial flight across the South Atlantic, performed by one of the most daring pilots of the company – Jean Mermoz. On May 12, 1930, he piloted a single-engine loaded with 130 kilos of mailing pouch for 19 hours uninterrupted, crossing the Atlantic Ocean, since Senegal to Natal on the Brazilian coast. The provision of that service reduced the transport time of a letter between France and Argentina from thirty to eight days.

The technological innovations of transportation enabled the news across the world to be received more quickly, and what was once far, appeared closer, contributing to the perception of space shrinking due to the shorter physical displacement of the message (letter) by faster transportation facilities.

However, in addition, other innovations also contributed to this shrinking perception, as the development of telecommunications technologies, like the telegraph and the telephone. In this case, yet, the message could be switched instantly between geographically distant interlocutors, eliminating time travel of the spatial displacement, once necessary for the correspondence exchange.

At first, telegraphy depended on long wires and submarine cables to exchange messages. However, unlike correspondence by letter, that the delivery time was proportional to the velocity of the transportation and to the distance to be, telegraphic messages could travel by the electric fluid at the speed of 25,000 kilometers per second.

Since 1837, when the first telegraph model was patented, the difficulty of transposing spatial barriers would be restricted to the installation of wires and cables, because message could travel swiftly through this structure.

The world seemed even smaller, because events in distant places could be reported in terms next of the event date. Until then, the newspapers circulated with delays of days and weeks, because the only available means of obtaining the account of events was through correspondence, in a way that time for a message to go away impacted the term of its disclosure. An example of this can be found in the edition of the British newspaper *The Times* on January 9, 1845, with news reported from Cape Town eight weeks late and news of Rio de Janeiro from six weeks ago. News from New York was four weeks delayed and from Berlin, one week. With the advent of the telegraph, the flow of news information has become almost instantaneous, also inaugurating a new phase in journalism (Standage 1998).

If for centuries the communication distance was as fast as the fastest transportation of the era could travel, in 1905, according to the testimony of an Brazilian telegraph engineer (Silva 2011), it had been completed the wires and cables network required to do a telegram around the world in just nine minutes. It was established the instantaneity of communication on a global network.

Since its discovery until half of the XX century, the telegraph was the main system of long-distance communication, when it was passed over the phone, whose main advantage is the voice messaging transmission, allowing the caller to hear their loved ones who were away. Despite differences between the two systems, the instantaneity of communication, characteristic of telegraphy, also persisted on the telephony.

³ The visionary Pierre-Georges Latécoère created a regular airline to transport mail in 1919, realizing the urgent need to accelerate communication and the availability of skilled fighters pilots in World War I. Therefore was born the Air Line Latécoère, with flights between France, Spain, Africa and South America. In 1927, Marcel Boullieux-Lafont, french investor based in South America, acquires that airlines, whose corporate name became *Compagnie Générale Aéropostale* (CGA), counting 200 aircraft, 17 floatplanes and 1500 employees, including 51 pilots. Among these, hired in 1926, Antoine de Saint-Exupéry, author of “*The Little Prince*”. In 1933, *Aéropostale* along with other companies, gave the company “*Air France*” that linking Europe with South America until the present day.

The time-space compression to the point of reducing the world to a global village is the striking feature of contemporary society, where the only limit not yet overcome by man is the speed of light (Virilio 1995).⁴ The long effort to accelerate the speed of the movement reached its apex: instantaneity, which, in turn, is an attribute of the changing relationship between space and time.

Thus, the change that is spoken of is the fact that space has become irrelevant, thanks to time annihilation. In this contemporary world where space can be traversed instantly, the difference between 'distance' and 'here' is nullified. "Were the outcomes of human actions before they could become conditions of their effectiveness, and before they could be deployed to make yet more differences, and the differences more profound and less contestable than before" (Bauman 2000:112).

From the time it was possible to transgress the limits to movement speed; power has become extraterritorial and went on to travel with the electronic signal speed, facing no more space limitations. The development of cellular technology was significant in this meaning. For Bauman (2001), the advent of the mobile phone serves well as *coup de grâce* in symbolic dependence on space, because the own access to a telephone point is no longer required for an order to be given and fulfilled. The difference between "close" and "far" is about to disappear.

Although instantaneity was already present in society through communication by telegraph and telephone, and the cellular combines features of both, we highlight the following differentiation concerns about the predecessors: individuality, mobility and portability.

The first, individuality, is a device for individual use, is not shared among people established in a certain fixed point, be a residence or a company. The cell phone waives the mediation of third parties (telegraph operator, operator or person who answers the phone and finds the recipient of the call). Also, allows customization of the device, such as: ringtones, color, custom covers, screen shots, applications, etc. So, each unit, although replica of another, may be perceived as unique and exclusive, revealing the preferences and characteristics of its user.

Next, there is mobility, than can be used anywhere regardless of access to a fixed point or wires. And portability: the apparatus is lightweight and can be carried in a pocket. It monitors the user in their spatial displacement.

2. Final considerations

In a society of instantaneity and inconstancy, tomorrow is elusive, ephemeral and unreal, even used to pass credibility and hope to people. As if we used an ideal of accomplishment that will probably never materialize. Between the past and the future, the human being builds a bridge between durability and transience, living in a liquid modernity where it is necessary to assume responsibilities and live in the moment instantaneously in time and space unique.

Instant factor – classified by Bauman (2001) as "cancellation of space resistance and liquefaction of the objects materiality" – allows each moment to seem infinite. The term "long-term" is not out of our vocabulary, but seems to have lost its meaning and has each time less importance, because, if we live in a society that used and discarded things and people faster than ever, gain more time is not attractive. While the solid modernity was looking for "eternal life", fluid modernity does not incorporate it (Bauman 2001).

The new formulation of the space-time binomial alters the human society and man's relationship with the environment. The liquid power is in who can liquefy. In other words, who has

⁴ Currently two of the three physical barriers were overcome: sound, heat and light. The sound barrier was broken by the super and hypersonic aircrafts, while the heat barrier was implemented by the rockets that took humans out of Earth's orbit without melting from the friction heat. However, the speed of light barrier is not something you can cross without promoting disorder in the story and even the relationship of living beings with the world (Virilio 1995).

the freedom to make decisions, occupies a more prominent space and is free to move almost imperceptible. The administration in lightweight capitalism consists in keeping the labor away from space, because the software era is no longer holding any of the two dimensions, and allows freedom of movement, volatile and fickle, by its dynamic development in any space and time around the world.

Before, the time we needed to get somewhere was the same for all people, regardless of social class. This relative equality left them on the same level. With the advent of the steam engine, there is a possibility of differentiation: the one who has access to the most effective means of transportation saves time. Even today, even with space-time compression increasingly effective, geographical distances continue, but also remain differences in mode of locomotion. Besides the differentiation between modes of moving people, like car and airplane, it is necessary to take into consideration otherwise studied in this paperwork, which is communication. In this one, the search is increasingly supplying the time to put a human being in instant contact with other geographically distant through the cell phone, for example.

And is this portable and disposable device, designed to allow the constant availability and contact with the outside world of the nomadic people that represents the culture of instantaneity. Is the way we live today that values individuality, immediacy and mobility. A world where the speed of light is no longer enough.

Abstract

Francesca Woodman is a milestone in the history of photography. At just 17 years old she started a large project: to photograph her own life, from birth to death; creating symbolic images of the time to represent her reality. This artwork is constituted by several symbolic elements, making use of her body and other objects to compose the scenarios. Therefore, this paper aims to analyze Francesca Woodman's life and artwork interpreting her photographs through representative forms (Imitative Representation, Figured Representation and Ideational Representation). This study will be based on the work about matrices of language and thought written by Lucia Santaella (2001) that presents a critic and detailed analysis about the explored topic.

1. Introduction

Undoubtedly, Francesca Woodman is a milestone in the history of photography. Using simple techniques and sceneries, she was able to tell great stories with only a snap in her camera.

At only 17 years old, the photographer started a great work: to tell how her life was. Since her birth until her death. Full of meaning, her photos could transport those who see them to Francesca's world, immerse in strong melancholy.

In this paper, we will analyze some photographs taken by Francesca, in order to identify different significant ways found in her work. So that, we will explore representation levels by visual matrix analogy which are worked in the work *Matrizes de Linguagem e Pensamento*, by Lucia Santaella: Imitative Representation, Figured Representation and Ideational Representation.

Imitative Representation makes conventionality imperceptible, like music sheets – where musical note symbols represent the note itself for those who can read it. Figured Representation is identified when representation conventions are through denotative figures, such as, pictograms – figures represent visible objects or actions. Finally, Ideational Representation represents abstracts ideas or concepts, through idea diagram indications.

Additionally, this research focuses on analyzing cultural conventions of the time Francesca Woodman lived – lifestyle of the society, how women were seen, the influence of arts in that society, if there was some work similar to that girl's, which elements made her daily life – in order to understand the meaning of all elements found in her photographs and understand existing connection between sign and object mentioned.

The objective shall be exploring the meanings found behind symbols forming her photos (since solid objects until the body of models).

Interpreting a “simple” photo can show us that it is not so simple. Behind its propositional function, there can be a big narrative structure, with a big symbolic dimension.

In 2010, C. Scott Willis made a documentary about Woodman family until the death of Francesca.

I think that my major surprise was to be able to read her diaries and notebooks and see her works on video. I found that her work is much more fundamental than it seems to be and that there is much to do with the celebration of life and not much with the lack, as it is shown. As her brother says on the documentary, I think the art was a religion to her and to her family. And who knows if the problem had its origin here” (WILLIS, 2010).¹

A great part has not been properly explored. Thus, through this article, we focus on obtaining more explanation about her work to better understand one of the most admired photographers in the present.

2. Cultural Conventions at That Time

The 60's was not only marked by excitement and political conflicts, but also by the great artistic development. It was the time for changes.

The emergence of counterculture influenced by social movements was a great milestone for the youth at that time. Based on criticisms to the authorities' values and middle class' lifestyle, many people adopted alternate styles and ideas. Hippies created one of the most famous styles – simple clothes, long hair, drugs, free life, sex and music.

Young people started to live in a more simple and informal way. Liberal attitudes concerning drugs and sexuality were a huge revolution for that time.

This big cultural change was assimilated by all arts. For example, in popular music, protests against political matter at that time were very common. A big struggle for civil rights of population, through songs full of hidden meanings that confused and faced the government.

Francesca Woodman was born among all these facts and excitement. A young lady who was never interested in politics and had a particular lifestyle and a different way to see the world.

It is not possible to say that these disturbances happened in the United States influenced her work. However, we cannot deny that Francesca also made history, as well as other young people of that time.

3. Francesca Woodman – Life & Work

Francesca Woodman was born in 1958 in the United States. Her father was a painter, her mother was ceramist and her brother was a moviemaker that was she grew up in the middle of the arts. At 13, her parents gave her a camera, but they did not know it would change her life and the way she looked at the world from then on.

Francesca started to photograph the world around her in black and white. She started to find alone the camera tools, as well as lighting to be used in her photos. She soon noticed that photograph was her great passion.

At 17, Francesca went to Rhode Island School of Design, where she started her big project: Photographing her life. But unlike many other photographers, this girl showed a unique style in her work. Exploring elements, such as Naturalism of female shapes (using nudity), Surrealism, phantasmagoric touches, Symbolism, Barocco and Futurism were constant part in her work.

In order to create her sceneries, the girl used elements of nature, such as leaves, flowers and branches, as well as local buildings of where she lived (houses and walls). From these elements, Francesca photographed scenes that were reference to her own existence. Even using some colleagues as models, the history created in photographs was based on her own.

Always with a melancholy and sadness touch, she used a lot of hide-and-seek – she hides the body behind wallpapers, plastic bags, piece of glass and on the floor – to show the big contrast between her fragile body and hardness of solid objects. Such elements helped to form a complex set of symbolic density, her work.

Her photos can transport those who see to Francesca's world. Since her birth, her teenager findings of sexuality, difficult passage to adult life until her premature death.

Francesca creates a parallel universe for herself. She lived her job and her job lived her strongly intense, so that her destiny was established. At 22 years old, her photos showed phantasmagoric elements, symbolizing the passage of her life to the moment of her death. As her work used to reflect her reality, her life also came to an end.

Few days before her father takes part of a big exhibition of his work, Francesca finished her work and her life, when she threw herself from the window in 1981. Her face was disfigured, like the faces in her last photos.

The young photographer only became famous after her death, when her work was exhibited at Wellesley College. Today, Francesca is one of the most distinguished photographers in the world, due to her originality and intensity.

4. Language and Thinking Matrix

According to Lúcia Santaella, Language and Thinking Matrix explain the origin of existing languages. These are formed from three main matrixes, based on human perception. They are: Sound, visual and verbal matrix.

Representative or symbolic forms,

are those that reproduce the appearance of visible things, and this appearance is used only as a mean to represent something that is not visibly accessible and, as a general rule, has an abstract and general character” (Santaella, 2001, page 246).

“*Representamen*” plays its role with no need of similarity and analogy to the subject mentioned. Normally, this relation happens through an association of ideas – so that symbol can be

interpreted, such as referring to that object. Thus, it becomes a *legi-signo*, working through a replica.

4.1. Classification of symbols

The meaning of symbols can only be interpreted through cultural convention codes. And, then, it is required to recognize these cultural codes to identify the symbols for its figurative representation. An example to be mentioned is the cross that is a Christian symbol.

Representative visual forms show something of the visible world (thirdness) and, from here, branches are created for secondness (denotative and referential) and firstness (iconic, mimetic). However, Santaella (2001) says that it is only possible because there is certain similarity between this form and that she means.

Representative forms work as symbols and refer to the object that mean due to a rule or habit or convention working to make these forms to be interpreted, such as referring to that object (Santaella, 2001, p.248).

Interpreting an image can show very complex meanings. They can tell us great histories from their symbolic elements. And they can be deciphered from specific representation forms: Analogy, imitative, figured and Ideational.

5. Representation Forms

5.1. Representation by analogy

Representation by analogy is the first modality of representative forms. It happens through conventional symbolic forms that maintain similarity relations to what they represent. In turn, these forms are structured according to general laws and cultural conventions.

Thus, cultural conventions are necessary for understanding. But their symbols present similarity between sign and object mentioned. For example, the representation of a king, when placed in the middle of the figure and bigger than his vassals, shows his power and his central social position. There is a cultural convention to understand, such as size and position (similarity between sign and object).

In this representation by analogy, there are three other types of representation that will be analyzed as follow:

5.1.2. Imitative Representation

This representation is done through mimetic prominence. Visual form is also connected to the object through a system of conventions. But as imitative aspect is strongly present, conventionality is almost imperceptible.

A good example is the music sheets that imitate the direction, the movement, velocity, and form of sound configurations.

5.1.3. Figured Representation

In this case, conventions of representation happen through denotative figures. They can be considered a type of writing, connection between symbol and object as figured.

Pictographs are an example of figured representation, because they are figures representing visible objects or actions that are also part of a system of cultural conventions.

5.1.4. Ideational Representation

Ideational representations represent abstract concepts or ideas. They are formed by more schematic figures (idea diagram indications). For example, Chinese writing, where expression “too hot” is “very hot” is represented by the union of two ideograms of “fire”.

6. Representations Found in Photographs of Francesca Woodman

Analyzing the work left by Francesca Woodman reveals the existence of all representative forms. However, in each photo, some of these representation levels are more outstanding than others.

Examples that will be presented below show an emphasis in some types of representation, even such photographs have all of them.

Image 1

Francesca used many things of hide-and-seek game in her photos. In the case presented above, she hides her body behind the wallpaper creating the environment. The contrast between her body and the paper reveals the fragility she used to establish to herself. The superposition of solid materials on her body creates this effect.

Thus, a representative form is created. That is, additionally to reproduce visible things (the female body and wallpaper); the photograph also represents something abstract.

Here we can see a case of Ideational Representation, where an abstract concept or idea is represented through superposition of simple elements.

The wallpaper now has new functions: Armor and camouflage. Francesca wishes to show a shady atmosphere about her reality in most of her photos. Thus we can conclude that her work becomes an escape of the real world. This escape seems to be so delightful that mix and merge with reality, making impossible to differ one and another. Her work became her own life.

Image 2

Picture taken in the beginning of her project, focusing on portray her life. In this case, the moment of her birth.

The position Francesca takes can be assimilated to the same position of a baby when leaving maternal womb. At the same time, it can also represent the form of her mother's womb.

Also, similarity between the photo and the position of Jesus Christ crucified shall be analyzed. This would give purity to the baby that had just been born, with no contact with earthly "sins".

In this photo presented, we can find two types of representation: Imitative Representation and Ideational Representation.

When analyzing how Francesca imitated the position of a baby, womb and Jesus, the Imitative Representation is identified. She also used positions to remind an idea already found in people's mind, through existing cultural conventions.

Ideational Representation is found through an abstract idea (birth).

Joining these two representation forms enrich the analysis of this photograph. Francesca shows that, when she was born, her life was intended to be full of melancholy, such as symbols presented in the image.

Image 3

In the end of her work and also her life, Francesca's photos had a phantasmagoric atmosphere. Faces were not evident anymore, like in the beginning of her work.

This "stain" touch in the face portrayed before represents the time passage and her untying with life. She was preparing herself to the end.

Interpreting this picture leads to identify *Ideational Representation*. Through the movement game and also the lack of illumination, the moment of arrival of her death is represented. An abstract concept (death, agony) through the composition of simple symbols and gestures.

The idea of death is reported using the figure created with fast movements of her head. So there is no more focus, reflecting the agony Francesca had been facing. She knew her work was coming to an end, as well her life.

Image 4

When discovering her sexuality, Francesca used mirror games under her body, in order to represent her curiosity and findings about her own body. Face is also blurry, that would represent her confusion when facing the subject.

Thus we found an example of *Figured Representation*, when assimilate the mirror to her intimate body parts and also the action to touch and find her.

There is also an *Ideational Representation*, as sexuality is an abstract term that can be represented through a game of objects and position of the model.

This is one of the cases where more than one representation form is made evident and complementary very clearly. This set can communicate the message that Francesca used to create her scenery. They are not required words, only a set of elements positioned and mounted so that meanings are clearer to the eyes of those observing with attention.

And it is exactly the art of gathering such symbols and meaning, making Francesca's work unique and innovative.

Image 5

This photo brings the same idea of the hide-and-seek game about the wallpaper.

Using the combination of solid elements with her body, Francesca explores the fragility she assumes to her.

Tree barks around her arms represent a kind of armor, as if Francesca was not strong enough to live with no protection. At the same time, they also have an idea of camouflage. She would be hiding from the world, a fear to face her own reality, preferring to concentrate only in her photographs. It is a great example where reality mixes with the world created by Francesca, where she was safe and under control. Here we have the *Imitative Representation* (when tree barks have an image of armor) and *Ideational Representation* (barks represent the abstract idea of protection and safety).

Image 6

With this photo, Francesca reinforces the idea that her work reflects her own life, even when using different models.

Naked women represent the transparency that her work wishes to have, when portrayed her feelings and her way to see the world where she lived. It was only Francesca and her life.

It is important to say that we did not find Francesca smiling in her photographs. It also happened in the image presented. It shows that the image she showed to people about herself was not so positive. Once more, the fragility established for her body and her personality was in evidence. Francesca built her self-image in order to show elements found in her work: The phantasmagoric, distressed and melancholic atmosphere.

We found an example of *Imitative Representation*, exactly because women are “imitating” Francesca, when holding her face in their hands, like saying, that they were Francesca Woodman. Literally, they would be “imitating” how the photographer showed herself to the world.

7. Final Considerations

Francesca Woodman knew how to explore different ways of representation in her work. That is why her work became a reference in the history of photograph.

From simple elements, she could create complex meanings. Her work is similar to a story-

book, with no words needed to tell them. In order to find a sense and linearity, you have just to observe the symbolism in her picture.

It is fundamental to notice that more than one representation way is found in a sole picture. Their sceneries are made of a combination of imitative, figured and Ideational representation. Although they are different, these representations bring a common objective to Francesca: Making her feelings and confusions transpire through photographs. In several moments, the young photographer represents her fragility when hiding her body behind solid elements; explores her femininity using elements of nature, such as flowers, proving her passage to teenage years, discovering sexuality – through mirrors placed between her legs, arrival of death, with figures created by the movement of the body, always restless, showing agony because life is coming to an end.

The combination of these different forms of representation, as well as her interpreting, shows how Francesca's work is valuable to the history of photograph. A young girl, born among artists, living in a time of cultural explosion, started a seemingly simple work: show people how her life was. The differential was exactly the way chosen to portray it.

The thin line between work and life was left behind by the young photographer. Her work used to show exactly what she lived.

Always in a melancholic and figure way, it seems that Francesca wanted to show how her life was traced to a tragic end, since the beginning – as she had planned and portrayed her end, like the rest of her work.

VIRTUAL AND PHYSICAL AESTHETICS OF THE HUMAN BODY–WITH REFERENCE TO THE FASHION DESIGNS OF JEAN-PAUL GAULTIER

Miki Okubo
Université Paris 8, France
mimi.okb@gmail.com

Abstract

In his work, the human body is often both abstracted and concretized. These strong, opposite expressions are present simultaneously. “Abstraction” means human body represented as numerical/digital information while “concretization” means vivid existence in a real, physical sense. Today, the human body seems to be becoming an increasingly informational object. People have very detailed numerical knowledge about the body. In addition, technological developments allow us to construct our body image in a way similar to androids or robots: an ensemble of complicated wire circuits transmit electrical signals to be integrated into a central part like a brain. When it comes to the perception of heat, for example, people can comprehend according to a specific color shown on a thermometer’s screen. Virtual images settle progressively in our mind. “Skin Series”, where Gaultier used three identical models, illustrate clearly this observation. Each piece represents muscle, blood vessels and bones. His illustration shows a kind of simplification to figure these organs and everyone will understand what he represents. However, in spite of their closeness, these organs will never be visually familiar to us. Our awareness is drawn to them only during specific occasions like an accident or an injury. Advanced medical knowledge and detailed anatomical knowledge have given us a typical human body image. In short, a reconstructed body through new technologies is very different from a real body, accompanied with smell, perspiration and weight.

Furthermore, Gaultier is one of the first couturier to appoint atypical/untraditional fashion models. Today, the an unusual body seen on the catwalk no longer causes sensation because

we have become accustomed to this kind of surprise, seeing various models, large, small and different. However, at the time Gaultier first introduced this idea, it caused a scandal amongst the conservative realm of Haut Couture. Certainly, there are many variations on the form of the human body. Gaultier dressed a man of rough structure in his finest feminine dress. He put the finest lace stockings on well-muscled masculine calves.

What I attempt to theorize in my presentation is the modern relationship between virtual image and the true, physical human body in order to understand the reality of contemporary fashion concerning body consciousness and physical perception.

1. Introduction

Jean-Paul Gaultier, born in 1952, French Haute Couture and Pret-a-Porter couturier, never received formal training for his profession. His diverse, innovative, provoking fashion, radically confronts critical issues in conventional Haut Couture. Unfortunately, his works have been misunderstood and incorrectly evaluated partly due to his excessively provocative slogans. The revaluation of his designs and creations concerns his manner of representing the human body which radically influence our body consciousness.

In his work, the human body is often represented as both an abstract object and a concrete figure. These strong, opposite expressions are present simultaneously. The “abstraction” of the human body refers to a stylist’s use of numerical/digital information or virtual images to represent the flesh while its “concretization” refers to a vivid representation of a real, detailed, physical existence. Today, the human body seems to be becoming an increasingly non-subjective object but an “objective” one thanks to very detailed numerical and biological information about the body. Along with this vast knowledge, technological developments allow us to construct images of the human body way similar to those of androids or robots.

Jean-Paul Gaultier is one of the first couturiers to appoint atypical or untraditional fashion models. Today, an unusual body seen on the catwalk no longer causes sensation because we have become accustomed to this kind of surprise, seeing various models, large, small and different. However, at the time Gaultier first introduced this idea, it caused a scandal amongst the conservative realm of Haut Couture.

In my presentation, I attempt to decode the modern relationship between virtual image and the true, physical human body in order to understand the reality of contemporary fashion concerning body consciousness and physical perception.

2. Who is Jean Paul Gaultier?

Jean Paul Gaultier was the creative director of Hermès from 2004-2010. Born in a modest family in a suburb of Paris, he lived with his parents and grandmother who gave him an initiation into couture during his childhood. Through his grandmother, he discovered the corset and was inspired to create the famous design: “cone-shaped bra” (**Figure 1.**). In 1971, he started working as an assistant of Pierre Cardin who was deeply impressed by his sketches. He presented his first individual collection in 1976 (aged 24), and another one in 1981. His revolutionary success impacted fashion. Since then, he has been known as the “enfant terrible”¹ of not only French Fashion but also in international fashion context. Jean-Paul Gaultier collections are inspired by street wear, popular culture, striptease, sadomasochism, etc., deviating completely from the formality or normality of conventional Haute Couture’s, thus, celebrating the outsider.

¹ The surname “terrible child” is due to his “different” professional career, whereby he passed through many traditional *maisons*, with a radical attitude and an ignorance of Haute Couture world’s conventions. He turned fashion creation upside down, surprising his clientele.

Beyond the apparent eccentricity of his creations, there are other, more interesting characteristics notable in his style: an original portrayal of the beauty of human body. Liberated from standards, far from convention, he plays with it, jokingly, sometimes even transforming human body into something absurd, not sophisticated, ridiculous, nonsensical, unstylish even bad-looking!

Traditionally, fashion has been an ardent pursuit of the absolute ideal human body. The infinite study and insistent effort to achieve this ideal is called “fashion”. From this point of view, Jean-Paul Gaultier’s creation is contrary to all norms in traditional fashion. This deviation holds great meaning, his artistic expression opened a door toward possible new representations that liberate the human body from all kinds of existing stereotypes.

3. “Cone Bra”: Abstraction of the human body

In Jean-Paul Gaultier’s creations, the designer radically transforms the body into a completely unrealistic form. One of the most famous examples is the cone-shaped bra. This costume was beloved by Madonna (**Figure 2.**). She appeared in a cone-shaped bra during her “Blond Ambition Tour”² in 1990. The unrealistic form resembles an android robot, far from being “sexy” in the usual way. Madonna in this nude pink corset, accentuating feminine body parts, was absolutely provocateur for spectators, triggering fashion’s most legendary moments. This corset with a cone-shaped bra was first presented in Jean Paul Gaultier’s Autumn/Winter collection in 1984.

Gaultier is known for being one of the first designers to appoint plus-sized models or untraditional models on his catwalk. Beth Ditto³, American singer-songwriter, author-interpreter, well known for her activities with the indie rock band Gossip, was appointed as fashion model for the Jean Paul Gaultier collection Spring/Summer 2011. The presence of Beth Ditto in the show was definitely a standout moment. She appeared on the catwalk wearing a black mid-length dress, the breasts covered with delicate pink lace and small flowers, shaped like the cone-shaped bra corset. Her performance surprised conservative amateurs of fashion, opening up a new road toward more creative rendering of the human body. The appointment of Beth Ditto was significant not only for showing the designer’s favour for “plus-sized” or “untraditional” models but also displaying his open-minded attitude toward LGBT: Lesbian, Gay, Bisexual, and Transgender, and feminist, too. (**Figure 3.**)

Eve Salvail, Quebecois, born in 1973, was also appointed by Gaultier as his model. Several years after abandoning modeling, Gaultier ushered her back into the European fashion world in 1992. He shaved her head and tattooed a Chinese dragon on it. Salvail reappeared on the catwalk in a heavenly corseted temple dress fastened tightly her torso, using the opportunity to come out as a lesbian. The public was shocked.

What is the purpose of appointing “atypical” mannequins such as Beth Ditto, Eve Salvail or even male models in women’s fashion shows, adorning them in dresses and other traditional feminine garments? Why did he dress such diverse models in the same *cone-shaped bra* corset? We can understand his decision to dress various bodies in the same costume as a kind of homogenization of body image despite the undeniable diversity in real human body shapes. Each different body can be prepared as uniform and homogeneous ones. Jean-Paul Gaultier’s purpose was to focus on representing strikingly diverse bodies with one “universal” body image using the human body as a “media”.

² “Blond Ambition” is a tour carried out by Madonna in 1990. During this acclaimed four month tour, Madonna gave fifty-seven concerts in twenty-seven cities all over the world.

³ Beth Ditto, born in 1981, is an American singer and song-writer. Feminist and lesbian, Beth Ditto shows her militant attitude for contesting social conventions, and for the freedom of sexuality, especially for homosexuality.

4. Living fashion mannequins: Concretization of the human body – Scenography of the Jean-Paul Gaultier exhibition at the Barbican Art Gallery, London (2014)

At the Barbican Art Gallery in London this year, an exhibition titled “The fashion world of Jean Paul Gaultier from the sidewalk to the catwalk”⁴ featured 32 mannequins coming to life with interactive faces created by high-definition audio-visual projections. Featured among these 32 “living” mannequins, are the voices and faces of Eve Salvail (model), Melissa Auf der Maur (bass player) and Gaultier himself. These collaborators lent their faces and voices (speech and song) for this innovative scenography project. (Figure 4.) Rambling through the exhibition to survey presented works, visitors’ attention was overcome by the mannequins’ “living” faces, brought to life by fixed video-projectors; especially that of Gaultier himself, which engaged on-lookers with his personal commentary on the exhibition. When the visitors walked through the exhibition space, the scenography gave a strange impression. Compared with exhibitions where artists show their works on certain “immobile” or “fixed” supports, these “living” mannequins can in effect become an obstacle because they strongly attract visitors’ attention, sometimes enough so that they pay much less attention to the designs on display. According to the designer’s statement, he did not want to use neutral, identical, “immobile” supports to show his works. Rather, he hoped to stage his creations in a living context; as if real human bodies were wearing them.

In my opinion, the significance of this scenography characterized by spatial and video-projector usage for audio-visual effect is, first, the “differentiation” or “detachment” (Brecht’s *distanciation*) of “identical” fashion mannequins’ bodies. Jean-Paul Gaultier also provoked the stereotypical fashion models body image: thin, sophisticated and homogeneously standardized. Fashion models, walking on catwalk, have a standardized look and perfect body-line. His intention of projecting real faces on identical fashion mannequin heads means, secondly, his challenge. Throughout this scenography, Jean-Paul Gaultier demonstrated that we can make up a neutral, prototypical body without specific features to appear different, original, unique.

In the first argument concerning the costume *cone-shaped bra corset*, Jean-Paul Gaultier showed a kind of “homogenization” of body image beyond the diversity of human body shape. The second argument about a scenography with “living mannequins” concerns the “differentiation” of fashion mannequins’ identical bodies in order to concretize and *distanciate* as if each individual owns a different body. Now, we observe the third point of view, referring to Gaultier’s two creations about human body representation and body consciousness.

5. “Skin series” and “Nude dress”: Virtualization of the human body – Flesh wearing flesh, the body wearing bodies: body tights⁵

5.1. “Skin series” (Figure 5.)

Three, tight, separate printed costumes represent muscle, blood vessels and the skeleton. The costume representing muscle is coloured by realistic shades of red and orange flesh, while those of blood vessels and heart (coloured red) and bones (coloured black and white) are illustrated in a pop-art manner. Using the pop-art manner, each tight costume shows a different layer of human body. His representation of the inside of our body stirs up typical virtual/digital images we meet constantly in our daily life. These images can be seen in anatomical illustration books, at medical examinations, or on computer screens such as in tridimensional animations and games. These printed tights emulate body and tattoo arts from all over the world. This garment allows us to wear a kind of second skin on our real skin. What was Gaultier’s real intent in representing several diverse inner layers of the body as a second skin?

⁴ This retrospective exhibition took place from April 9 to August 25 in 2014, in the Barbican Art Gallery of London.

⁵ Body tight is a tight covering entirely the body.

These tights turn our bodies inside-out, exposing muscle, blood vessels and skeleton. These costumes may be considered as a kind of transparent cloth exposing what is inside. However, I would like to regard the effect as “turning inside-out”. Kiyokazu Washida⁶, Japanese philosopher, gave an interesting explanation about the effect of the cloth turning inside-out, referring to Yohji Yamamoto⁷’s cloth design in the 1990s. Kiyokazu Washida theorized on the meaning of wearing cloth that “turns inside-out” in terms of our body consciousness from the point of phenomenological view. The clothes created by Yohji Yamamoto in the 1990s, usually black, provoking stereotypical beauty norms in fashion, carved his way in deviating from the main stream of fashion kingdom. Certain jackets and pullovers were turned inside-out, exposing any sewing traces which generally are well-hidden. Concerning the act of wearing clothes, Washida explained that the inner side of cloth directly contacts our body/skin while the outer side works as protector against the outside world. According to him, turning our clothes inside-out means exposing our corporal “intimacy” toward the “exterior” society. The role of cloth is therefore overturned. However, in my opinion, Gaultier’s design goes beyond this case. These tights expose human’s muscle, blood vessels and skeleton, which are clearly much more intimate than skin because they are located in the internal body. But, this intimacy is a just a “mask”. The muscle, blood vessels and skeleton are painted, numerically designed and printed on the material. What we see on them is a kind of “general” organ image or the interior image of human body. Wearing these tights, in reality, doesn’t mean the exhibition of our own interior, nor our intimacy, but allows us to put on a “general” model of the inside of human body. Their images are virtual and can potentially belong to anyone, all human beings.

5.2. “Nude dress”⁸ (Figure 6. & 7.)

Look at another creation of Jean-Paul Gaultier, that is, the nude dress that could go as far as making us feel ashamed when we imagine ourselves in it. It is a series of tight-fitting dresses, with illustrations of nipples, omphalos and pubic hairs on their surface. Human beings, as highly civilized animals, dress themselves for the purpose of covering the intimate parts of our body. Showing in public once again these hidden intimate parts should cause sensational confusion. However, Gaultier could respond to the ordinary public’s reaction by saying that the intimacy here is virtual, not real, and that his costumes are a representation of visualized body image as well as a humorous illusion... That is why “Nude dress” plays an important role in the consideration about the relationship between the act of wearing and body image.

Here, we can apply the same way of thinking as previously in the “Skin series”. In short, these “Nude dress” are prepared as a kind of a suit of armor, which makes your own body invisible by covering completely with a “ready-made nude”. The nude exposed in public doesn’t belong to anyone. Those who wear this costume do not have to feel ashamed because it does not show their body, nipples, omphalos or pubic hairs. This means a representation of a “typical” nude, not a particular one but “universal” one.

6. Conclusion: escape from the self or self-representation of “inter-subjectivity”

Practicing fashion or costume wearing is a way of self-representation via our own body. For carrying out this self-representation (fashion), we have to be responsible for our own body; we

⁶ Kiyokazu Washida, Japanese philosopher and phenomenologist, is author of many books concerning philosophical analysis of the vestment and the act of wearing clothes.

⁷ Yoji Yamamoto, Japanese fashion designer, is famous for his creations of the street fashion style, especially by the usage of black. He created many vestments “too large and too long”, “damaged” or “inside-out”.

⁸ Nude dresses are garments which are designed as if the person wearing them were nude. These dresses show nipples, omphalos and even pubic hairs on their surface.

have to care for it, maintain its good condition, exercise it, etc. All we have to do, from head to toe, can be exhausting.

Jean Paul Gaultier proposes an alternative point of view for fashion as a self-representation via the human body. Wearing a costume featuring many different layers of the internal body, in the inside-out manner (observed in the tight costume “Skin series”), or enveloping the body with the painted “Nude dress” (which plays a role of armor to protect our real existence against the society), nullifying the variety of body shapes by shoving them into the same corset (observed in “corn-shaped-bra” costume) or revealing a fact about human body’s homogeneity and its potential for transformation by projecting images on identical fashion mannequins’ heads, does Jean-Paul Gaultier reveal the true meaning behind his innovative fashion creations ?

Everything Gaultier did throughout these trials is a kind of sublimation of the body image as a universal object.

Wearing garment as a way of self-representation is based on our individual body as media. The art of Gaultier offers us an alternative way to enjoy ourselves in fashion. Individuals can obtain metaphysical and universal images of human body. The designer may say that the media (human body) does not have such an importance but it can easily be turned out, modified, deformed, made invisible or visible and even nullified, thanks to the art of fashion.

Paradoxically, Gaultier’s fashion creations are not self-representations but representation of inter-subjectivity. Playing with the possible appearance of human body, the designer constructs the “universal” image, which confronts stereotypical and shared understandings. After consideration, the act of wearing clothes, that is, the practice of fashion, is free from all restrictions and negative judgements of the body (“ugly”, “unsophisticated”, “ungraceful”), but fashion becomes an activity permitting a liberated body consciousness in order to sublimate the individual body image as a “universal” one.

We know that some of Jean-Paul Gaultier’s creations are radical and that his costumes do not seem like realistic clothes for the majority of fashion amateurs. Why did he create these absurd garments? For what purpose did he intend them? The act of expression carried out by a fashion designer is in a dilemma. Although the creation of a designer is considered his own artistic expression, when he presents his works, it is not through his own body that the designer carries out his exhibition, but through the medium of fashion mannequins’ bodies. The self-representation in Jean-Paul Gaultier’s creations is “distanciated” and “differentiated”, transforming into a kind of sharable expression for those who appreciate them. They benefit from the simple joy of wearing the designs thanks to a universalized body-image, free from self-consciousness.

Abstract

Transmediation in technological environments enables a semiotic equivalence in the translation process of languages in the technological aesthetic territory, thus demonstrating that the digital immediate object may be equivalent to the immediate object transmediated by advents derived by the convergence of telecommunications. So, digital advents for interactivity of gestural control (gestural interfaces) are becoming increasingly more accessible to different audiences, for example, kinetic simulators for the development of environments that assist robotics and its advances in biotechnology. For these reasons, many technologies called “touchless screen”, as kinect or leap motion, demonstrate the possibility of interactive immersion in three-dimensional environments that reveal the opportunity to understand a representative user immersion in technological environments. This demonstrates the possibility of using these technologies in the treatment of schizophrenic people, because the possibility of creating an ubiquitous universe comprising an aesthetic of simulated environments from the intensification of subjective volatility of personality can help psychiatrists in the development of avatars derived from hallucinations of certain patients to assist in their treatment. This paper aims to show that there is a possibility to create visual avatars from hallucinated data based on a repertoire once auditory hallucinated by a patient. This process enables the interactivity of psychiatrists with their patients so that they can become possible the contact with the hallucinated narrative, demonstrating the quest for understanding the equivalence between immediate objects that are transmediated inside and outside the visual environment, highlighting places of experience from symbols

representing something that is not visibly accessible. This study will have base in the avatar therapy by Langlois, which is engaged in treatment via virtual world using avatars, and in the matrices of language a thought by Lucia Santaella for demonstrating sound and visual matrices in contiguity through representation by analogy.

This present paper makes an explanation about a phenomenological proposal for the study of transmediation and schizophrenia. It is divided into three parts. In the beginning it will be explored the main characteristics of schizophrenia, regarding the concepts of dynamic object, immediate object, percept and percipuum. In the second part it will be presented the avatar therapy developed by Julian Leff and its main features, what takes to the last part: a new proposal for the evolution of avatar therapy.

1. Characteristics of schizophrenia

To start it is necessary to explore the main features of schizophrenia that will form the basis for the proposal to be made in this paper.

Currently, for psychiatry, schizophrenia is regarded among the most serious diseases of the mind and can be characterized as a group of pathologies that denote changes in thinking through hallucination. Thus it is reasonable to understand that this analysis of schizophrenia raises the possibility of an understanding that initiates a strand of study that opens the doors to research the thought and language derived from hallucinatory events, i.e., it is taken for basis schizophrenic hallucinations, which in turn are taken here as a real perception of an object that has no external stimulus; it is still possible to say that the hallucinated object is real for the person who is passing through a period of hallucination.

To deepen the notions of this main feature of schizophrenia and to make possible to continue the understanding about perception and cognition in schizophrenic logic we have the words of Oliver Sacks:

When the word “hallucination” first came into use, in the early sixteenth century, it denoted only “a wandering mind”. It was not until the 1830s that Jean-Étienne Esquirol, a French psychiatrist, gave the term its present meaning – prior to that, what we now call hallucination were referred to simply as “apparitions.” Precise definitions of the word “hallucination” still vary considerably, chiefly because it is not always easy to discern where the boundary lies between hallucination, misperception, and illusion. But generally, hallucinations are defined as percepts arising in the absence of any external reality – seeing things or hearing things that are not there (2012:Introduction 1 – 3).

At this moment it is possible to understand that a hallucinated event participates in the repertoire of the hallucinating person, i.e., sciences that comprehend the structure and functioning of the human mind can show that schizophrenics bases language and thought from a repertoire that is not always given from external stimuli.

With this overview it is evident the tendency that studies about hallucinated events has in only consider the biological and medical scope, they do not notice that the characteristics of philosophy and communication – as well as a variety of other sciences – can help in the comprehension of hallucinated realities. Thus, it easy to find a necessity to approach perception and cognition through the “counterarguments to the theories that have to appeal to ‘sense-data’ for explaining the perception.” (SANTAELLA, 2012a:90)

Starting this contextualization it must be considered that all the analysis on sensory stimuli and sense-data performed until here has a much larger amplitude in Peircean theory; which qualify everything perceived as a percept.

In a 1970 article, R. F. Almender tried to demonstrate the consistence about Peircean theory of perception. He argued that this theory is sustained in a metaphysical realist stance theory and so it is epistemologically coherent. Peirce affirmed, without hesitation, that all we perceive is a percept. What is out of us and arrives to us, what is arrested in a perception act, is called percept. (SANTAELLA, 2012b:89)

Accordingly, it is possible to observe the percept as everything that forces itself to the recognition without using support, in other words, it is the object of perception. Santaella still presents an ambiguity found in Peircean theory about the exploration of the percept:

In one hand, [...] percepts are not presented with a mental nature. They are not mental constructions. Instead of it they are compulsive initiators of thought, insistent and demanding, uncontrollable and precognitive. In the other hand there are some moments that Peirce gives to the percept a mental character. (2012b:92)

Santaella demonstrated that there are moments in which Peirce places the percept independently; not tied to any interpretative mind. But, in other moments, there are reports in which Peirce elects the percept to a mental product, as can be seen below:

Notwithstanding its apparent primitiveness, every percept is the product of mental processes or, anyhow, of processes that are mental for every intensive purpose. (PEIRCE *apud* SANTAELLA, 2012b:92)

It can be seen that there is a moment in which the percept is taken as a product of cognition. For this situation Santaella present a solution elaborated by Richard Bernstein in which he says that Peirce solved this ambiguity about the two meanings for the percept when he created a third term, the *percipuum*. So, the percept remains independent and external to mind, while the *percipuum* is in the perception judgment, i.e., the percept can be understood as any stimulus that still did not have contact with any sensory receptor, while the *percipuum* is the percept at the metaphysics moment when it is processed by an organism.

Considering the hallucinations it is possible to conceive that the analytical differentiation is not related only to the percept, but also to the *percipuum*. This indicates that the percept, even if it was not propagated by external stimuli, is the same in a mere psychological evaluation about sense-data, both for hallucinating people and for any other person who has not any mental disorder. Thus, the beginning of hallucination happens in the fast moment when the sensory interpretation starts, i.e., in the transitory fugacity from the percept to the *percipuum*.

Therefore, when the perceptual irregularity embody in the mind of a hallucinating person – already in the cognition – it is accentuated an interpretative duality, because the object that

propagated the stimulus is not real; while the percept insists in its reality. This is what makes the cognition of this person not apprehend this judgment of perception as something wrong. In example, Peirce says:

... judgment of perception only can refer to a simple percept that will never exist again; and if I judge that it seemed to be red, when, in fact, it did not seem red, it must at least to be recognized that it seemed to be red. (PEIRCE *apud* SANTAELLA, 2012b:108)

This explanation demonstrates the emergence of subjective thinking and the need to study the importance of the signification given to these percepts in the mind of schizophrenics; what is constantly discussed in the avatar therapy currently worked by Julian Leff.

2. Avatar therapy

Avatar therapy is a kind of therapy developed by Julian Leff, Emeritus Professor in UCL Mental Health Sciences, that tries to create an avatar of the voice hallucinated to make possible people with schizophrenia control what they hear. This three-dimensional computerized system allows a kind of new therapy that is not based on pharmaceutical treatments and its objective is to reduce the frequency and severity of episodes of hallucination.

The first step is to help the patient to create the three-dimensional computerized avatar of the voice heard, i.e., the patient is instructed to create a face of the entity heard translating a sound matrix into a visual matrix. When this face is created the computerized system synchronises the avatar's lips with therapist speech, so the therapist situated far from the patient can speak through the avatar in real time. Thus, the therapist can pretend to be the voice heard by the patient and stimulates the patient to resist or even fight the voice making possible the patient starting to control the hallucinations.

Julian Leff says:

Even though patients interact with the avatar as though it was a real person, because they have created it, they know that it cannot harm them, as opposed to the voices, which often threaten to kill or harm them and their family. As a result the therapy helps patients gain the confidence and courage to confront the avatar, and their persecutor.

This makes it possible to think about a new proposal for the evolution of the avatar therapy.

3. A new proposal for the evolution of avatar therapy

According to Julian Leff the avatar therapy do not achieves higher results because the avatars have no longer realistic features. It is what hinders the spatiotemporal reality immersion of the schizophrenic.

Therefore, it is possible to start a strand of study which understand that the transmediation in technological environments enables a semiotic equivalence in the translation process of languages in the technological aesthetic territory, thus demonstrating that the digital immediate object may be equivalent to the immediate object transmediated by adverts derived by the convergence of telecommunications. So, digital adverts for interactivity of gestural control (gestural interfaces) are becoming increasingly more accessible to different audiences, for example, kinetic

simulators for the development of environments that assist robotics and its advances in biotechnology. For these reasons, many technologies called “touchless screen”, as kinect or leap motion, demonstrate the possibility of interactive immersion in three-dimensional environments that reveal the opportunity to understand a representative user immersion in technological environments. This demonstrates the possibility of using these technologies in the treatment of schizophrenic people, because the possibility of creating an ubiquitous universe comprising an aesthetic of simulated environments from the intensification of subjective volatility of personality can help psychiatrists in the development of avatars with more realistic features.

Allied to this technological environment, to create an avatar it must also take into consideration its graphic construction. So this process enables the creation of visual avatars for hallucinated data that formerly were part of an only auditory hallucination. This process enables the interactivity of psychiatrists with their patients so that they can become possible the contact with the hallucinated narrative, demonstrating the quest for understanding the equivalence between immediate objects that are transmediated inside and outside the visual environment, highlighting places of experience from symbols representing something that is not visibly accessible.

This contiguity between sound matrix and visual matrix can be understood through the theory of representation by analogy made by Santaella:

These symbolic forms in Peirce’s sense means conventional but they are at the same time motivated by maintaining ties of resemblance to what they represent. Although these forms are structured in a system and represent their objects by general laws, established by habits or convention, there is however, between both (sign and object), a relation by analogy that is characterized by a certain content of apparent or diagrammatic similarity. (2005:248-249).

These forms, a Third in the Peircean theory, bring the possibility to represent more faithfully the hallucinated voices of schizophrenics, demonstrating a spatiotemporal immersion that can more effectively create a reality from advents that enable the interaction with technological environments. Such reality for Peirce is not independent of the previously hallucinated thought:

Peirce’s “reality” is not “independent of thought”, just like Scotus’s *realitas* is an *ens rationis*, or mental entity, in the sense that we make the distinction in our mind (but still has a basis in the existent thing). Reality for Scotus has a basis in the existent thing, a Second. Peirce takes Scotus’s notion of reality, frees it from the “idle” and complicated distinctions which burden it (like non-adequate identities and such), and recycles it, after adding the notions of the scientific method and synechism, defining it as the object of final opinion. As a result, the basis for the notion of reality for Peirce is a Third. (MAYORGA, 2007:153)

The proposal presented here shows that the junction of applied sciences with theoretical sciences is accentuated for the infinite and necessary contiguity for any use in research. What is evident, then, is the need of applied sciences such as psychiatry and neuroscience seek sources in theoretical sciences. Thus showing the possibility of working with Peirce’s semiotic in studies that previously were taken into the walls of the biological area.

The aim here were to show the possibility of joining the study of matrices of language and though with studies of technology environments for the evolution of the treatment of schizophrenia, leading patients to have the freedom to insert themselves into a harmonious spatiotemporal hyper-reality without assumptions on individual characteristics; made in an universal consciousness original content.

Abstract

Denbigh, in his book *Three concepts of time*, asserted that time is a topic that perplexes. The tendency of understanding time as something existing, something that is ‘out there’ is one of the factors that provokes this. He continues his argument stating that time is an abstract entity, a necessary construction to cope with the changes involving existents. This statement is the starting point for diving in the meaning of a video. For this analysis it is necessary discussing image and its form of relationship with time, emphasizing how long the materiality that constitutes the image stands.

Memory has been considered concomitant to our sense of personal identity for a long time. It is the medium throughout the record of our past memories survives within us besides the ego awareness’ basis.

Whitrow (2005)

1. Introduction

Santaella and Nöth (2001: 193) classifies images, inserting them in the visual matrix, putting the images in the universe of indices, but they say that “it does not mean this language is unable to achieve the purest levels of iconicity.” This statement allows to accommodate the notion that a picture in general is an icon and as such it represents by similarity between objects and signs visual qualities. These qualities can only be compared with other qualities. We intend to enrich the reception of the analyzing video comparing its visual qualities with different images.

The challenge here is to think about image and time. For doing this, we started our reflections, about a video made by the Brazilian artist Felipe Barros. We used a synchronous approach, taking images of different places and epochs comparing the similarities which may exist, emphasizing the visual qualities, in order to highlight some aspects of the relationship between time and image.

2. Time

Discussing some image and time aspects, the first concept we have to elucidate is the time itself. Task already considered difficult by St. Augustine, in his Confessions when in BOOK XI, he says: “What, then, is the time? What, then, is time? If no one ask me, I know; if I want to explain him, who asks, I know not”.

Whitrow (2005) discusses the time quoting several scholars who have dedicated to this topic: Jean-Marie Guyau in the second half of the nineteenth century said that time is not an earlier condition, as a Kantian intuition, but a result of our experience of the world. Whitrow also quotes Robert Hooke, who in the seventeenth century, wondered about the existence of a sense that would give information about time, concluding that none of our senses are capable of it, but memory has to do with this.

To Denbigh (1981: 3) one of the difficulty causes of dealing with time concept is the fact that it is taken as a real thing, when in fact it is not. He is clear at this point: “Time is not ‘out there’ as a substantial thing like a flow river; it is rather an abstract entity, a construction. The things which are ‘out there’, on which the construction of time is based, are the material objects and their events and processes”. The time concept would have been created, as Denbigh declares, accounting for the changes and events:

... the clouds are moving and changing their shapes; plants are growing and withering; the positions of the heavenly bodies are slowly shifting; and men themselves progress inevitably from birth to death. The great value of the time concept is that it provides a systematization; all such events and processes of change can be treated as elements within a unique serial order.

For example: I looked the apple yesterday and it was green; I look today and it is ripe. We have here two perceptions that could refer to two objects, but several factors, like the fact that they were at the same place, suggest that there was the same apple; in this case, I only can understand that it is the same fruit if I include the idea that there is a change, which must have occurred in the period between yesterday and today. In other words, it is necessary the time concept. This necessity is also emphasized by Peirce (CP 6.416):

That time is not directly perceived is evident, since no lapse of time is present, and we only perceive what is present. That, not having the idea of time, we should never be able to perceive the flow in our sensations without some particular aptitude for, it will probably also be admitted.

The statement that time is a mental construction can be translated into Peirce’s terms as time is a semiotic construction because there is no thinking without signs. It is well known the ar-

gument with which Peirce answers negatively to the question: “Whether we can think without signs”, in the article “Questions Concerning Certain Faculties Claimed for Man”.

Time, therefore, is the result of a semiotic process in which events and changes are perceived and articulated. This process allows a mental organization in which different perceived things are understood as different moments of a temporal process. Taking the example given above, the ripening process of the apple is a possible interpretation of the perception of two apples; in this case, the ripening stage of each moment I look at the apple is index of the time passage.

Time is a broad subject, including the relation between time and simultaneous events that were important to Einstein theory, as well as theories in many fields of knowledge, but the ideas we have seen here are adequate to develop our reasoning.

3. Image

Time has many implications in different areas, so its comprehension is difficult, but the notion of image is not also easy. A first distinction to be made is shown by Santaella and Nöth (1998: 15) on the two domains of images: “the first is the domain of images as visual representations (...). The second is the immaterial realm of images in our mind.” In this case, we are talking about the first domain, those images that these authors specify as “drawings, paintings, prints, photographs, films, television, holographic and infographic images.”

We are interested in pictures of the first domain and we need to know what possible relations they establish with time, however, classify how this relationship occur is not easy because time is always present in the image in one or another way. About this subject Santaella and Nöth (1998: 75) proposes a division between intrinsic and extrinsic time in the image. The last one can be of three kinds: time of wasting; time of the reference or utterance, and the lack of time. We are interested in the time of wasting defined as how long the image materiality takes to waste.

3.1. Time in images

In another chapter of the same book, Santaella and Nöth (1998: 157) propose “the existence of three paradigms in the image production evolutionary process: the prephotographic paradigm, photographic and post-photographic”. Time in the figurative images will appear differently in each one of these paradigms and the comprehension of this difference provides a path to understand the relationship between time and image.

Dondis’ book (1974) presents a useful proposal when she says about the three levels of the image, which she call abstract, figurative and symbolic. The concept of symbolic level is different from the Peirce’s concept of symbol; besides that we have here some ideas we can articulate with Peirce’s thought creating a methodological procedure to think about images.

When analyzing any image, the ideal situation is that at the first moment, we have to pay attention to the abstract level, the visual qualities such as formal aspects: patches of colors, lines and directions.

As Maurice Denis (apud Chipp 1978: 90) says, “a picture – before being a war horse, a woman or any anecdote – is essentially a flat surface covered with colors given in a particular order.” This is a difficult task because as Dondis says (1974: 74) “Abstraction, visually, is simplification toward a more and more intense and distilled meaning”.

In a second moment we would see the splashes of color representing something by similarity, they can be seen as something like a man, a woman, a dog, etc. but normally we first see a man, a woman or a dog; we automatically tend to see things, animals or persons; as if the representations of these things have nothing to do with the formal elements that allow their existence as visual representations. Is is necessary some visual training to see the abstract level.

Finally, if we have a representation of a man, for example, this man could represent a sort of

idea. This is the symbolic level.

One image useful to exemplify this analysis is the Norman Rockwell painting, *The Gossips*, created for the cover of “*The Saturday Evening Post*,” of March 6 in 1948¹.

In the level of formal qualities, the image shows colors, lines, textures and a kind of structure similar to a grid, the lines and colors can be perceived as representing several people who are probably part of the same community. The characters are presented in pairs where one is looking to the right and another to the left, showing different facial expressions. The painting becomes meaningful when we see the juxtaposition of different images as representing different moments in which one person tells something to another, the next draw of the same person show facial expressions changings, showing surprise or laughter, representing synthetically what happens when a gossip is spread. To understand this, we must build a notion that between one pair of images, and another there is a time interval. A representation of time is implicit in this image.

The work of Dennis Oppenheim, *Reading Position for Second Degree² Burn* is an example of a completely different kind of relationship between time and image. This work, performed in the context of conceptual art, shows two pictures and a text. In the first photo there is a man lay on the sand with a book over his chest, in the second picture he is in the same position but his skin is sunburned except where the book was.

A photographic sign can be understood as icon, index and symbol, as says Dubois (1986: 51). A photograph is icon because its visual qualities denotes its object; it is symbol since “All images are analyzed as interpretation-transformation of real, as an arbitrary creation, cultural, ideological and perceptually codified”. At least photos are mainly indices, which have real connection with the referent, or as Barthes (1984: 14) says: “the photograph always carries its referent.”

These images have visual qualities that allow us to recognize them as two photos taken from the same person at different times. The verbal information reinforce this interpretation of a changing in the object of the sign. As it is written, it took five hours of exposure to the sun for the sunlight marks the skin, but not the space protected by the book.

There are several chains of meanings in this work; among them, the fact that the mark left by sunlight on the artist’s skin is a negative mark. This expression shows the origin of the photography name, in Greek *phōtos* and *graphé*, meaning light mark. It is worthy mentioning that time left its mark on the skin and this is what generates the image and hence the meaning. The two photos record a time that is not a symbolic interpretive construction, but a concrete mark of its passage. We have time on the relation between sun and skin.

We cannot forget that many artists of that time worked with this approach, among many examples we can see the work of Richard Long, *A Line Made by Walking³* (1967) that is a mark left on the grass while he walked over it several times, in Sommerset, England.

There is also another thing which can be seen in these examples; they show the result of changings created by processes occurred in time. The record of these processes could have scientific purposes, as the record of a bacteria culture growing or the slab deformation, but our interest here is the works of art that use the changing brought up as the time passes by. Those works in which the transformations function as the passage of time indices, providing the polysemy that is inherent in art and inviting the viewer to navigate on the multiple meanings.

3.2. Image deterioration

An important point made by Santaella and Nöth (1998: 81) with respect to extrinsic time is degradation; for her, “The most obvious form of extrinsic time appears in the wasting or aging image.”

The photographs are made of materials, they are surfaces coated with photographic emulsion made of silver salts. These materials also go through temporal changes, mainly when they deteriorate. This degradation happens because of environmental conditions, such as humidity, temperature, light, air pollution; all these things affect the chemical composition of the film.

Museums have a controlled environment in order to minimize the deterioration of works of art, since it is not possible to avoid it at all, but the degradation can also appear as constitutive element of image, in works of art that use the deterioration process to generate meanings⁴. Some artists can use deterioration that had already happened in something, appropriating the deteriorated thing itself or some representation of it. This is the case of a photo essay by Andy Goldstein: *La Muerte de la Muerte*⁵.

In 1979, Goldstein made a series of photographs in cemeteries of Buenos Aires from the oval shaped photo-ceramics that are placed on the graves or found on headstones. The pieces of photo-ceramics were damaged and images were almost unrecognizable.

The image loss is inevitable, but the action of the photographer transforms it into language, leading our eyes to the perception of how little is left from the person buried there, his portrait, is also dying. Goldstein's photographs were shot and printed with technical accuracy showing the photographs damaged in the tombs. About this exhibition, Bril says that the photographs show the three deaths:

The first happens, in accordance with Barthes, already in the time to take the picture; it would be the death of the individual being transformed into an object. The second is physical the death and finally come upon the overall death in image effacement and affirmation of oblivion.

4. The Video

Goldstein's work shows photographic image representing other photographic images in the destruction process. This idea leads us to the video that motivated these reflections: made by Felipe Barros, artist from Alagoas, Brazil, who took part in the Djerassi Resident Artists Program, in Palo Alto, California, in 2010. During that period he made several videos related to time in which he produced the decay in the photographic image with chemicals that damaged the photographic support.

From all videos he produced in California, we will analyze one called “98001075056”, which shows a sequence of images being vanished, as shown in Fig. 1. At the end, there is a video in reverse showing an image regenerating.

The video lasts 3:11 minutes and shows the credits, five photos disappearing, and one image appearing. These images appear in the following sequence:

⁴ We can see some recent examples of this in the exhibition *The Stumbling Present: Ruins in Contemporary Art*, that happens at the Art, Design&Architecture Museum at the University of California, Santa Barbara between October 2012 to January 2013.

Fig. 1. Vanishing process

The artist says about this process in his Master's' Dissertation. He does not say who are the people, but indicates that they are his family (Barros 2012: 16). The first photograph shows a couple (figure 2); the visual aspects of the photo allows us to interpret it as a very old photo. The act of made this interpretation is one segment in a process where a sign generates an interpretant that is another sign. The interpretation is the generation of a Dynamical Interpretant that is "whatever interpretation any mind actually makes of a sign" (CP 8.315), but it also is the "effect actually produced on the mind by the Sign"

Signs have its material qualities, as Peirce says:

Since a sign is not identical with the thing signified, but differs from the latter in some respects, it must plainly have some characters which belong to it in itself, and have nothing to do with its representative function. These I call the material qualities of the sign. As examples of such qualities, take in the word "man," it's consisting of three letters – in a picture, its being flat and without relief. (CP 5.287)

Putting these definitions together: the material qualities constitute the sign which produces an effect on one mind. So, in the case of picture 2, the photograph's visual characteristics, as the sepia color of the photography and the appearance of the couple, especially their clothes, causes in the viewer's mind the effect that the object of this sign is an old couple.

The next image (figure 3) also shows a couple. The contrast, the position of women and the neckline of her blouse, are elements which allow the interpretation that this photo is newer than the other. This idea will be enhanced in comparison with the other pictures in the sequence.

When we have two images in sequence, we already have possible meanings that emerge from the relationship between them. So, we can think there is some relationship between the two couples, which gets other possibilities when we see the figure 4, which shows a young man.

After these images it is possible to establish an interpretative hypothesis: the imagetic sequence follows a logic which goes from older to newer photographs.

The picture does not assure the relationship among this man and the other people, the picture changes the meaning of the previous ones accordingly to that hypothesis, so it is not totally impossible to think that the previous pictures show the grandparents and the parents of the young

man.

The image that comes after (figure 5) shows a woman, the image itself does not offer much data to establish a temporal sequence between these photos and the others. Probably it is newer than the couples' pictures, but the hypotheses of a continuous temporal sequence changes and it is possible to think that the photographs representing the woman and the man are approximately from the same time.

The possible relationship between these two photos is highlighted because there is only one person, but the established relationship doesn't allow to say they are mother and son, siblings, mates, etc.

The last picture which will be destroyed (figure 6), shows a couple, they seem to be newer than the other two couples and give us impression to be wearing social clothes, indicated by the tie. We know that these pictures represent the same family and there are some similarity between the different faces, none information is provided, so we can only make hypothesis, like as the man and woman in this photo are the same from the previous photos.

At the end there is a reversed video (figure 7), showing the movement of fragments of photographic emulsion with pigment, these pieces start to join one another showing something that resembles a face, but soon starts a fade-out that will make the screen totally black. The pigment begins to show a photography in an orderly manner on the screen when the screen becomes darker, the recorded image begins to appear when a videographic feature begins to hide it. We can still identify a photography different from others because it is colorful. In the clues to the perception that the image gives, we can see a face of a smiling child. Only these last two photos show smiling people.

4.1. The Image deterioration shown on the video

The video is a type of image that falls into the category of intrinsic time, an image that consists of time, and "this constitution depends, on one hand, from the characteristics of the device from which the image is produced and presented" (Santaella and Nöth 1998: 76). The device here is a video camera; as well as the photographic camera that registered the old pictures. There are some features in a video that already existed in a photography, such as the framework, the shooting angle and lens, but I want to highlight that it is an image what is linked to that photographed, its referent, as Barthes (1984: 41) says:

We would say that the Photography always carries its referent, both affected by the same amorous or funereal immobility, at the heart of the motion world: they are glued together, limb by limb, like chained to a corpse in certain tortures doomed; ...

The video image analyzed is also attached to the referent. We have faded color photos from people with clothes that is no longer used, what qualify as old photographs. Even before we see the movement of the video image, time is present in the difference between video time and that one of the photographs, creating a similar situation to that mentioned by Barthes (1984: 142) in a photography showing Lewis Payne sentenced to death in 1865 with the caption "He is dead and will die." He is dead when I see the picture, but he will die when it was taken. In Barros' work the pictures belong to a different time from that of the video record, even if the people who appear in the photos are alive, time when the photo was taken, has passed, died.

The photographs, taken by Andy Goldstein, represent the deterioration of the image material basis; in the case of the video we are talking about, the artist provokes and records this process. He says (Barros 2012: 17) that this happens when he puts "printing photos on a full bleach transparent container, which by the action of chlorine corrodes printed silver-based photos". With this process, after about five minutes, the picture is completely destroyed. The destruction of image lead us again to the theme of dead. Bazin (1960: 4) says something interesting about that:

If the plastic arts were put under psychoanalysis, the practice of embalming the dead might turn out to be a fundamental factor in their creation. The process might reveal that at the origin of painting and sculpture there lies a mummy complex. The religion of ancient Egypt, aimed against death, saw survival as depending on the continued existence of the corporeal body. Thus, by providing a defense against the passage of time it satisfied a basic psychological need in man, for death is but the victory of time.

Bazin and Barthes present two different stances to death that has been pointed before in the origin of our notion of time. Mulvey (2006: 60) notes that:

... for Bazin and Barthes, photography touches the complex human relation to death, but their shared perspective then diverges. For Bazin, it is to transcend death, part of the process of mourning; for Barthes, it is ‘the dive into death’, an acceptance of mortality.

The photos in the analyzed video show the two aspects together, remember that those people died, but it also a reminder of died people. These two characteristics are inherent to the sign, as put Santaella (2009: 65) “the mere presence of the sign denouncing the absence of what it represents.”

The sign has a power to represent, but this power is lost when the material basis of the sign decay, when the emulsion that bound the pigments dissolve, the organization of colors is lost and nothing guarantees the similarity between pigments, sign basis material, and what it represents. The fading of the figure also reminds us that signs are things and as things sign deteriorates, as well as people they represent. When losing the sign, we also lose the memory and history.

There are several factors in this video that indicate ways to interpretant generation: the title is one of them. The number 98001075056 appears as a puzzle, but in Brazil it can be recognized as the sequential number of the ID card. The word identity, however, has a broader meaning than the document, pointing toward other meanings as pointed by Barros’ (2012: 16):

In video 98001075056, I try to act directly on the materiality of images when I appropriated from old photographs of my family. The name of the video is my ID number, national identification document, which sought to address the idea of identity by descent.

Erikson (1978: 36) was a psychologist who worked with the concept of identity. When he writes about a neurosis suffered by a doctor campaign, he said he was impressed with the lost sense of identity form patients and presents a concept of identity by saying: “...this sense of identity provides the ability to experience one’s self as something that has continuity, sameness, and to act accordingly”. (p. 36)

The identity is related to the perception of being the same person over time, despite changes; it is the feeling that something remains. Several facts collaborate in the construction of this feeling, but one of them is memory. If time exists as a mental construct that accounts for changes, when dealing with long-term changes, it is necessary to record them with the help of memory devices to which the human being has accessed, such as diaries, photographs, letters, etc. We need memory to remember the events and organize them temporally, if we lost memory we cannot know what changed, or what remained.

This is the irony of the title of the work of Barros: it is a number sequency that identifies him,

as well as the photos of his ancestors, but the photos are dissolved, disappeared, and without some form of registration there is no way of knowing which genetic drifts of those people exist in the artist, so the identity is lost, breaks into flakes of pigment emulsion. On the other hand, the image of the child at the end leads us to think about new things and also indicates some hope that not everything is lost, but we should not delude ourselves, in the video there is not an idea of redemption by the child: it is necessary effort for seeing an image forming and identifying the child. Maybe we could start to see the identity as indicated by Bauman (1998.36):

Instead of building their identity gradually and patiently, as to build a house upon the addition of roofs, floors, rooms or hallways - a series of “new beginnings”, which is experimenting with forms instantly grouped, but easily demolished, painted over each other: an identity of palimpsesto.

Palimpsest in this case is a great word because for putting new information, word or image in a palimpsest it was necessary to erase the information that existed on the parchment. Barros erases the information in photography and on this empty paper that was the support of the photography, we can design our reflection and thoughts instigated by those images, which brings a new look on them.

THE MYTH IN TRIUMPH OF THE WILL (TRIUMPH DES WILLENS) – AN ANALYSIS OF THE SYMBOLISM USED IN THE AUDIOVISUAL NARRATIVE OF LENI RIEFENSTAHL

Sílvio Henrique V. Barbosa
Faculdade Cásper Líbero e ESPM
shbarbosa@hotmail.com

Abstract

This research aims to analyze the symbolic images – and clearly inspired by the mythologies of the West and the East – inserted at crucial moments in the narrative of the most important political documentary in film history, *Triumph of the Will*, directed by German film maker Leni Riefenstahl.

Symbols of power of ancient civilizations are reworked by Nazism, as the spread-winged eagle, representing the Roman Empire, and at the same time so many other peoples and civilizations, which now appears holding a swastika.

The most important Nazi symbol, adapted from Hindu and Buddhist mythology, is also a divine representation: stylization of sunlight expanding symbolizes the divine power itself. Carl Jung distinguishes natural from cultural symbols and both are present in this documentary, which combines ancestral myths – Pagans and Christians – as the Messiah to the figure of the protagonist of the movie: Adolf Hitler.

1. The Myth in *Triumph of the Will (Triumph des Willens)* – An analysis of the symbolism used in the audiovisual narrative of Leni Riefenstahl

“... My film is just a document. I showed what everyone witnessed or heard about. And everyone was impressed. I was the one who set this impression, who recorded it on film. “

(Leni Riefenstahl)¹

00:03:04 – Scenes of clouds. Not seen from below, as we are accustomed, but there – beside us – as if we were floating with them. Yes, we are in the sky, flying with the imagination and through the lens of Leni Riefenstahl, Adolf Hitler’s favorite film maker. She was chosen by him to create the most important audiovisual narrative of Nazism, recording the most crucial congress of the National Socialist German Workers Party (Nazi Party) from September 4th to 10th, 1934, in Nuremberg.²

For one minute and nine seconds we admire the sky and we can define inside the clouds, right beside us, a plane... an aircraft with the insignia of power; the plane of the Chancellor Adolf Hitler.

00:04:13 – Now, our visual focus changes. We fail to look at the sky itself and come to see what is on the ground. The old city of Nuremberg, founded as a castle in the 11th century arises; a city with almost a thousand years and with a strong symbolism for the Nazi Party created itself in that same state, Bavaria. It is there that the congress of the National Socialist Party happens since its embryonic stage in 1927, repeating in 1929 and then – with Hitler in power – annually from 1933 to 1939, when the Second World War begins. Nuremberg, reminds Germans the promise of Adolf Hitler: to build a new Reich, an empire to last for another thousand years.³

For one minute and 16 seconds, we see the city from above and at a certain moment, the plane casts its shadow over the historic buildings. The shadow of Hitler’s plane, for only nine minutes, brings us to some important myths.

The format of the plane reminds the shadow of a large bird, referring Germans to the image of the eagle, the symbol of the Roman Empire, an animal that represents the Divine Being in different cultures because it can fly close to the sun. And which is now adopted as a symbol, next to the swastika, a swastika of Nazism.

¹ Leni Riefenstahl’s interview to the *Cahiers du Cinema* (1961).

² In this Congress, Adolf Hitler must prove to the Germans and to the world that he is the undisputed leader of the Nazi Party just two months after the purge that led to the murder of 85 people, almost all members of his paramilitary forces, the SA (Sturmabteilung) with three million militiamen..

³ *Mein Kempf*, Adolf Hitler.

The eagle rests on another Nazi symbol: the swastika

But how this eagle, which appears in many other moments of the show-documentary, which is a symbol of power in so distant civilizations, can lead us to associate it with the Divine in the contemporary world? It can because the myths are present and are picked up by our unconscious. The symbols come from what Carl Jung called the “collective unconscious”, ie the part of the psyche that retains and transmits the common psychological inheritance of mankind.⁴

Eagle, symbol of strength and beauty, which circulates between heaven, abode of the gods, and the Earth, where we live, sometime back there, in pre-history, conquered the position of divine spokesman. And it kept it during kingdoms and empires, in various cultures, from the prairies of the American West to the Siberian steppes.⁵

The image of the eagle, in my view lies in Jungian definition of natural symbol, which we can decipher drawing the most archaic origins, “that is, ideas and images that we find in the earliest records and in the most primitive societies” (Jung, 2008: 117).

Carl Jung distinguishes the natural symbol of the cultural symbol, used to express “eternal truths and which are still used by religions, having gone through numerous transformations and more or less conscious elaboration process, thus becoming collective images accepted by civilized societies” (Jung, 2008: 117).

⁴ Carl Jung, 2008

⁵ The Power of Myth, Joseph Campbell.

1.1. The return of the Messiah

Hitler greets followers in Nuremberg

“Behold, he cometh with clouds, and every eye will see Him, even they who pierced Him; and all kindred of the earth shall wail because of him. Yes Amen. “. Revelation 1: 7

Overlapping the divine image represented by the shape of the eagle, which appears as a natural symbol, though it has been rescued from the history books and brought to Nazi flags and banners, there is an even more pronounced presence of a cultural symbol, this still alive in memory and in the religious traditions of the Germans. The shadow on the historic buildings of Nuremberg remembers the most important reference of the dominant faith of Germany. The open wings of the plane of Hitler cast a shadow over Nuremberg in the cross shape, symbol of suffering, martyrdom, but also the victory of life over death.

The risen Messiah, says the holy book of Christians, will return to the world of men to rid them of injustice, suffering, and finally, from all evil.

As Wilkinson and Philip (2005: 3), the myths “are ambiguous and subtle, and have several meanings. They are not fixed, but flexible: they adapt themselves to changes and new knowledge.”

Leni Riefenstahl knew how to manipulate these myths in her audiovisual narrative – the two symbols, pre-Christian, represented by the eagle, and the Christian one, by the cross – got movement. As the eagle of the pagans, the cross of the Christians also speaks strongly to the German people. And both indicate the same thing: the Divine Being, the *Messiah* returns from heaven to end the suffering of the people, with the shame of defeat in the 1st World War, with the division of weak and corrupt parties, with the social chaos, economic crisis and unemployment, and the fear of a Communist uprising on Germany. Adolf Hitler, who embodies this Messiah of the German people deserved to be portrayed as the Messiah in the eyes of the director.

And last but not least, the eagle is never represented alone. The bird flies to the sun, the

greater symbol of divinity, and it takes at his feet the swastika, an ancient representation of the solar myth, the divine force that makes life flow through the universe.

There are only nine seconds of shadow over the beautiful city and then we lost that divine image of the Christ or of the eagle, depending on who reads it, and then we can see from above the perfect military parade.

Few seconds, 33 to be precise, and we exchanged the sky and what we can see from there by the ground.

00:05:29 – The camera filming the sky finally leaves us and we can see the world now through the eyes of those who have their feet on the ground. These are scenes, at the aerodrome, of clearly excited people with the approach of the leading aircraft... joyful and beautiful faces, happy faces, of men, women and children, many children. A selected audience, handpicked as the cheerleader of a game show.

00:05:57 – The long awaited leader has not yet appeared. But there are plenty of arms raised in the new greeting that the whole country is taking. New greeting? The raised arm and the cry of *Heil* is nothing new. The greeting is actually in the Roman Empire. The Caesars were well greeted by the population when appearing in public. The *Hail Cesar* has a distinctly religious connotation. Caesar is the living representation of the gods. He is a god that must be worshiped with its human form. Therefore, the Ave in Latin wins the connotation of a salute with a sacred tone.

Likewise in German, *heil* has a clear religious significance; the Ave Maria's preach in German means Heil Maria. Man welcomes, therefore, the new Messiah just as Catholics pray in German to the mother of God, or as the other Christian denominations refer to acts of God.

00:06:03 – Finally, the first apotheosis in the film. He, who comes from heaven through the clouds, appears in the door of the plane. Nods... smiles... The Messiah is among his people. He follows, cheered, the aerodrome to the city centre, in a long motorcade, in an open car, shot by every possible angle: the right, the left, the front, top, and even by an unseen cameraman positioned right behind him. Invisible because disguised as a Nazi officer, in uniform as all other 44 cameramen and assistants, a crew of 170 people, perhaps the greatest in film history.⁶

00:07:33 – Amid the procession, which lasts almost four minutes, and in which all eyes are on Adolf Hitler, the invisible becomes visible for the first time, not by Leni carelessness at the time of editing the film, but for the lack of option in the cut images. A cameraman appears in a quick picture on the left corner of the screen, in a scene that if was cut by the perfectionist director, would take away the sense of continuity offered by the numerous angles at which the parade happens. Something that surely went unnoticed by the crowd, who saw the film in theaters in the 30s, but with the help of slow motion or pause, does not escape from the watchful eye of most observers.

00:08:02 – The smiling leader, hailed by jubilant crowd that packs the streets, is surprised by a woman and a child, disregarding the safety cords that prevent people of approaching him, appear conveniently in front of the procession. The car of Adolf Hitler stops and he gets from the child a bouquet of flowers.

Mother and daughter, deeply grateful for the kind gesture of Germany's most powerful man, smile and make the Nazi salute as the car part again. With this simple picture, Leni Riefenstahl sets the standard that charted all political marketers from the 30s of the last century to now. Since she immortalized the affective gesture of people's father with his children, it has become

⁶ In *Triumph of the Will: cinema in the service of ideology*, Ana Elisabeth Rodrigues explains that "the team worked for a week, filming over fifty hours of film at various angles, many innovative for its time (...). The idea that guided Riefenstahl was that the film would consist of endless moving images. The motion of objects is supported by a dynamic, produced by film techniques, such as drives, the travelings, the camera up and down and the various positions of the camera." " In <http://www.oohdahistoria.org/n11/textos/elizabethfaro.pdf>

the rule to associate the loving image of the candidate to small. It is a dominant thought that someone who cares about children, worries about the future and the continuity of our name, our family, our tribe, clan, state, country, empire, civilization, species... Anyway, this man may be someone devoted only to the good things.

“As vegetarianism and habits of not smoking and not drinking and refusing to marry projected an increase of image above the normal human being”, says Richard Evans, professor of history at the University of Cambridge.⁷

An attempt, perhaps, to achieve the definition of Nietzsche’s Superman, the *Übermensch*, the Overman, as says SOUZA (2014: 104) “is the Auto Suppression of man... Because he would have the same characteristics of the previous God, now designed in himself... as a superman.”

00:08:38 – The procession follows and the documentary wins appearance of a tour into the medieval centre of Nuremberg. The camera stops in palaces, houses, monuments that speak of a glorious past, a past idealized further given the serious economic crisis facing the country since the defeat in the First World War. These are images that seek to neutralize the bitter taste left by the recent years of hyperinflation.

And the show comes to an end with the entry of Hitler at the hotel. Amid new ovations, more happy faces, keen eyes, the leader appears in the window of the balcony to greet his people once more before the rest.

00:11:15 – Night falls on Nuremberg, but the show must go on. Nazi formations lit by torches parade to the sound of brass bands, a military serenade throughout the city. The fire shining, again, refers to the symbolism, this time the German, also called Scandinavian or Viking. Fire with their aggressiveness is also builder of civilization. The fire is the power of the pagan gods, like Odin and Thor. For the Greeks, Prometheus stole it from the gods and gave it to the men, allowing the progress of our species. The fire heats food, helps to forge the weapon and the plow, brightens the night and keep away predators and the enemy.⁸

00:14:00 – Two minutes and 45 seconds later, and we have the dawn of a city still sleepy. The windows are opened and reveal the day being born with Nazi flags fluttering in medieval buildings. We have a sequence that resembles a sightseeing tour, in channels and beautiful buildings facades.

00:15:54 – And it is around Nuremberg that the movement is really happening. The huge camp of Hitler militants awakens. Tents lined up like a military camp. They are the whitest of whites, smarter and stronger among people. The intended, according to Adolf Hitler, to lead the reconstruction of a white Europe, free of inferior peoples, as Slavs, Jews and Gypsies, racially inferior immigrants who came from distant Asia to steal space of legitimate people that shall dwell there. “The nation that does not value their racial purity will perish”, says the leader in the bedside book of the Nazis, *Mein Kampf*, and also the leader of the Labour Fronts, Robert Ley, in the speech he will make in next day (00:31:34).⁹

00:20:17 – The streets are crowded again to attend another ceremony in honor of Adolf Hitler. As a Carnival parade, German peasants dressed in costumes of all rural areas of the country, walk through the streets to the sound of folk music... a profusion of short images, close-ups of children and young people. In each group, there are those who carry baskets of food. We have a minute and 20 seconds of parade, with healthy, beautiful peasants, Aryans, according to the Nazi design and, of course, happy with broad smiles, especially when positioned in front of Hitler to greet him. And then again the myth is reused, it is retold and inserted into the audiovisual narrative of Leni Riefenstahl.

⁹ *Minha Luta, Mein Keimpf*, Adolf Hitler, Brazilian Edition, 2001.

Hitler receives the offerings of peasants

00:21:55 – Amid the greetings with the raised right hand, farmers offer to Hitler the fruits of the harvest. Is it a meaningless scene? No, actually, it is the restoration of paid traditions linked to the cycles of the planet. The Earth provides the food. Gods who take care of the seasons, the rain, the sun, the fertility of the land itself, at last, deserve a thank you. And human communities, from the Neolithic, offer to the gods these fruits of the first harvest. The German tradition, lost with the rise of Christianity is now resumed. The many pagan gods are incorporated now by the *Übermensch*, the Nietzschean overman, in the Nazi point of view of Nietzsche's philosophy.

He, who at the beginning of the documentary, comes from heaven bringing hope, receives the offerings of its believers.

00:22:30 – After being welcomed by the people in the streets, it is the turn of Hitler to meet his personal army, which officially is an army of workers, which form the German Labour front. Workers wearing military uniform and that have, in the shoulder, not the German flag, but the swastika.

Hitler says goodbye to the streets to address the opening of the congress. And gets in front of the departure from the hotel, the smiles and of course, many greetings with arms raised, adults and children, workers and peasants, shown in open images interspersed with close-ups that illustrate the feeling of joy.

00:24:38 – The eagle, the party symbol, appears illuminated with a single light, in a dark environment; the legend tells us this is the room where happens the congress of the National Socialist German Workers' Party. The eagle with open wings is resting on the other party symbol, the swastika. The second apotheosis of the documentary happens in this palace, attended by the diplomats of the allies of Germany, representatives of the party, military and the main German churches, less Jewish, for obvious reasons. The speech of Rudolf Hess, Hitler's right hand, begins.

00:28:20 – A succession of apologetic phrases of party representatives, interspersed with constant applause and standing ovations, culminates in the salute to the leader, seen in close-ups at different moments of the speeches: *Sig Heil, Sig Heil, Sig Heil*, says Rudolf Hess looking to Hitler, that immediately raises to receive also with the right arm raised, the greetings of a delirious crowd.

1.2. Triumph of the Will

Hitler comes to the *Grand Finale*, the parade at Nuremberg aerodrome

The spectacular staging should cause the same feeling of monumentality of Nazism to the public and to those who could watch at the cinema this official document of disclosure of the party, the documentary that Hitler ordered to Leni Riefenstahl.

The actress who decided to direct his own films won Hitler and the German audiences with success *Blue Light* (*Das Blaue Licht*), becoming a professional with direct contact with the power and direct access to Adolf Hitler to discuss his shooting script and the perspective under which should immortalize Hitler on the film.

Leni Riefenstahl (right) and Hitler during the meeting with peasants

A vision, as noted, mythical, which explores the symbols of Germanic cosmology and Christian cosmology, showing Nazism as the force that restores the pre-Christian past glories to lead Germany to its great future.

00:35:50 – “One nation, one leader, one Reich, one Germany” – With this sentence, the German workers greet Adolf Hitler and summarize the future of all under his command. The event brings together 52,000 men from the labour force created by his government to reduce unem-

ployment in the country. Workers use uniform and the swastika on their shoulder. They carry shovels but manipulate them like weapons. An army of workers that in a few years will be revealed to the world as the most effective fighting force in history.

Workers of the labour force

00:45:31 – Young people, the future ... Hitler now has his encounter with the Hitler's Youth, thousands of boys who greet him with the right hand raised.

00:50:20 – “We want you to be obedient and you must practice obedience,” Hitler speaks to the young people. In the new society that is shaping, Hitler wants order and obedience above all! And at the end of this speech, the leader, as always, is applauded and welcomed. The cameras behind the crowd show Hitler leaving the area in an open car, being intensely cheered, while the Nazi anthem is sung with arms raised in the Nazi salute.

00:57:27 – Night. The show now takes the size of an overproduction, of a carnival choreography, complete with title: Seas and flags, and signed by Hitler's architect Albert Speers. Acting as a choreographer, he creates the parade of thousands of Nazi banners at the Zeppelin field. As a Brazilian samba school, the wing has its own theme: Seas and flags, toward apotheosis, a huge vertical structure, illuminated by spotlights and named Cathedral of Lights. A pagan cathedral, where instead of Christ on the cross is the enormous eagle with open wings welcomes pilgrims resting on the swastika.

On stage, or pulpit of the fake cathedral, the preaching is not done by a religious leader, but by the nations' own spiritual guide, the Fuhrer.

01:04:00 – Day. The giant eagle is shown in a horizontal movement, from head to foot, holding the swastika. A merger takes of the Nazi symbol and creates the image of three men crossing an ocean of carefully lined up soldiers. A new reference to the Jewish-Christian myths, the scene immediately takes us back to Moses, who opened the Red Sea, allowing the passage of his people to freedom in the Promised Land.

The ceremony is a tribute to the late President Hindenburg. At the sound of the funeral march, Hitler approaches the pantheon flanked by leaders of its two paramilitary forces, the SA and the SS. As there were no nearby buildings to make this the images, Leni creates the first effective crane in film history, holding a small lift in the Nazi flag mast.

01:07:26 – The lift goes up and down allowing perfect and large images, movements up and

down, recording the sea of Nazi flags moving, as if on their own, towards the podium where the leader is. Close-ups show the black soldiers (SS) running, in tune. It is a carefully rehearsed ballet.

01:11:25 – In the first reference to the massacre of opponents and leaders of the SA, Hitler states that are losers those who bet on the division of the Nazi movement. “It stands firm as this training today.” In this ceremony, which takes almost 11 minutes in the documentary, there is no room for demonstrations of joy. Hitler is serious while he greets dozens of soldiers of the SS and SA.

01:15:42 – Fade out from the Nazi flags. Fade in. And the day breaks with Leni cameras again showing the flags. And the wind takes care to show, behind the flag fluttering, Hitler approaching open car saying goodbye to the people of Nuremberg.

There are thousands of people in the windows, sidewalks and bleachers watching the parade of the new flags presented by Hitler to the paramilitary formations. In close-ups, Leni shows and identifies with credit caption one by one the Nazi leaders.

This is a great show, as in the carnival, with the different wings marching to Adolf Hitler Square, in the centre of Nuremberg. Leni shows the parade from many angles, with her cameras positioned in buildings everywhere and also spread at ground level, near the public.

In an especially happy angle for a director, the camera can capture the SS, Hitler’s favorite troop, marching under sunrays illuminating the black men, giving them a sacred appearance. The Black Guard brings the personal banner of Adolf Hitler and is euphorically acclaimed by the people who squeeze in the square.

01:34:40 – Hitler and his commanders are entering the final scenario of the show. The palace where the Congress was opened, now attends the closing speech. The eagle, until now viewed over the swastika, changes position. It decorates the podium just below the leader. And back there, on the wall, and above all, is the swastika. In an unprecedented scene throughout the documentary, you can see beads of sweat on Hitler’s face, exclaiming greatness and superiority of the Germans:.. “who knows that he is the holder of the blood better and consciously use it to achieve leadership and never give up! “

01:44:15 – And as if explaining the title of the film, *Triumph of the Will*, Hitler says: “It is my will and desire that this State and this Reich can withstand the millennia to come. We can be happy knowing that this future belongs to us completely. “

01:48:04 – After the endless applause and shouts of Heil! (Hail), Rudolf Hess takes the microphone and says, summarizing the goal of the congress and the documentary itself: “The Party is Hitler! But Hitler is Germany, as Germany is Hitler! Sig Heil” (Hail Victory).

The party anthem is sung by all present, while Leni intersperses images of people with a fusion to the swastika and to her marching soldiers, as in the lyrics. Final scene... Fade Out.

1.3. CONCLUSION

Hitler dividindo as águas

Leni, hailed as one of the most important film makers in history, did not escape the judgment of history itself, getting the rest of her long life the taint of Hitler film maker. She met with absolute technical rigor in order to portray the grandeur of the Nazi regime and to enhance the figure of Hitler.

Defending herself of her many accusers during the second half of the 20th century, Leni said that her work was merely a document of what everyone has witnessed or heard, in an attempt of explaining that in ours days

find some concordance in the opinion of the documentarist Bill Nichols that states “the documentary (audiovisual genre) restates the historical world, making it an indexed record; it represents the historical world, shaping its record of a prospect or a distinct point of view. The evidence supports the argument of the restatement or the perspective of representation.¹⁰”

According to Josep Catala: “the image becomes the most genuine representation of social reality, the reality as it is imagined and, therefore, as it is lived and used.”¹¹

“Taken without ideological prejudices, documentaries Riefenstahl are obviously exercises in style, research techniques, lighting and angles” says Hugo Estenssoro.

Leni faithfully fulfilled his duty to his patron that, beyond this documentary, will finance other works signed by the director, as the double documentary *Olympia*, the first full audiovisual coverage of the Olympics in 1936 in Berlin, and the novel “Lowlands” (*Tiefland*). Recorded during the war, this movie used slave labour of Gypsies borrowed by her production from concentration camps and was finished only in 1954, after she paid the penalty of three years in detention decreed by the denazification tribunal created by the allies.

In 2002, at one hundred years old, Leni reached an agreement with representatives of the German Roma Gypsies admitting what she had denied until then: gypsies were persecuted and exterminated by the Nazis during the war.

Ideological issues that have always defined the analysis of her work, little by little, lose influence on our academic studies. However, from an ethical point of view, we will never understand how the quest for technical perfection may have taken her to forget so many moral issues so relevant to humanity.

FROM ELVES TO SELFIES*

Simonetta Persichetti
Faculdade Cásper Líbero, São Paulo, Brasil
spersich@uol.com.br

Abstract

This article aims to discuss and analyze the new phenomenon that pervades social networks, the selfies. What meanings can hide such wave, such profusion almost *ad nauseam* of self images in this era of pretty much endless images? What is the cultural and imagetic difference between the old self-portrait and the contemporary selfie? Old and new dialogue in this text, passing through semiotics, communication and archetypal ideas of the Jungian thought, in this world of image-representation, image-editing in which the photographed is at the same time the editor of an imagined image.

Quietly they began to appear in social networks, in conversations, in discussions, and proliferated like mushrooms after a heavy summer rain. One of the phenomena of the 21st century, the selfie, according to the Oxford Dictionary (2013), is an informal photograph, a self-portrait taken with a mobile phone or a webcam and instantly shared on social networks. A phenomenon which, incidentally, does not make that much sense, for pictorial and imagistic representations have always favored portraits and even self-portraits. Art and photography books have always dealt with this subject, and many have tried to explain it from both the sociological and psychological points of view. I know of no photographer who has never made his/her self-portrait. But, let's face it, it has grown to a scale that had never been imagined before the era of digital networks.

* This article was published in the book "Comunicação, Entretenimento e Imagem", Dimas A. Kunsch e Simonetta Persichetti (org), Plêiade Editora, São Paulo, 2013.

Four years ago I developed a course for the Museum of Modern Art of São Paulo (MAM) entitled Photography and Symbolism, whose content I have discussed in several other courses and lectures throughout Brazil. In it, through mythological figures and literature, I tried to understand and analyze the myths, symbols and archetypes of contemporary society, always having the image as the backdrop, especially the photographic image, the portrait and the self-portrait.

Although the course is fairly recent, the theme of myth and photography has long intrigued me. Not by coincidence I did my Master's and my PhD in the field of Social Psychology, and in my post doctorate I am also developing a study on mythology and identity construction of political characters, more precisely of Brazil's presidents. But that is another story...

The first time I heard the word selfie was from the mouth of a freshman from the Cásper Líbero School of Journalism, in São Paulo. Interestingly, she was showing a self-portrait by the Chinese photographer Li Zhensheng, taken in communist China in the 1960s.

I decided to delve into this to try to understand how, out of the blue, such an archaic model of self-representation has become the darling of contemporaneity. To try to understand the symbolic behind this image and their senses nowadays. In the words of psychologist Carl G. Jung, "a word or an image is symbolic when it implies something beyond its obvious and immediate meaning" (1964:20).

The discussion is not new. Mythology and literature, as I already pointed out, have focused on this issue. How can we forget the myth of Narcissus, who was condemned to live an unfulfilled longing for love when he fell in love with his own image? For days and nights he stared at his picture reflected in the water, without ever getting to reach it. Or, if we think in the famous book by the Irish writer Oscar Wilde (1884-1900) *The Picture of Dorian Gray* (1890), in which the subject portrayed never gets old: it is the picture that, over time, displays the wrinkles that should be on his face. This desire becomes for Dorian Gray a terrible reality. A slave to an absurd ideal, that of eternal youth, it makes art be confused with everyday life.

What then of the thousands of selfies circulating in the social networks? Anonymous and not so anonymous people. A phenomenon that spreads exponentially. Who does not remember Barack Obama's selfie during the funeral of the South African leader Nelson Mandela in December of 2013? The self-portrait was taken with Prime-Ministers David Cameron, of the UK, and Helle Thorning Schmidt, of Denmark. The international media seemed not to like it.

Whenever I hear the word selfie, I do not know why, come to my mind the elves, which, according to Norse mythology, were creatures of the light. Young and beautiful demigods. And it seems to me that this is how people who publish their selfies see themselves, or would like to be seen. Shiny and luminous people. It is not always so. However, most times they are images devoid of composition, concepts and aesthetic concerns. The result leaves much to be desired, to say the least.

It is therefore in this context that I wish to discuss the self-portrait, or selfie, function of representation, setting and fiction in a society in which entertainment is the keynote of the culture of knowledge, of life.

1. Portrait, self-portrait and one's self representation

Portraits are fascinating. Perhaps the most seductive and difficult language, both in painting and in photography. The synthesis of the meeting of the vision of an image producer and someone who lets himself/herself be "immortalized" through strokes or lenses. An exchange between objectivity and subjectivity and the desire to see and be seen.

There is a social and political attitude in the act of portraying and being portrayed. But unlike pictorial portraits, in which the imagination and gestures of painters are often valued more than the represented subject, the photographic portrait, born in the early days of photography, was used ideologically by the bourgeoisie of the second half of the 19th century with the aim of

placing itself before the society of the time and of forging its own identity.

After all, born in the midst of a positivist philosophy, photography fit nicely with the idea of the cool and impartial look so dear to the thinkers of the time: “I only believe in what my eyes see.” “Honorific representation of the bourgeois self, the photographic portrait popularizes and transforms a traditional function by subverting the privileges inherent to the pictorial portrait”, says Annateresa Fabris. The author continues:

But the photographic portrait does much more. It contributes to the modern affirmation of the individual as it takes part in the configuration of his/her identity as a social identity. Every portrait is simultaneously a social act and a sociability act: in different moments of its history it obeys certain rules of representation governing the modalities of figuration of the model, the ostentation he/she makes of himself/herself, and the multiple symbolic perceptions raised in social exchanges. The model provides to the lenses not only his/her body but also his/her way of conceiving the material and social space, inserting himself/herself in a network of complex relationships of which the portrait is one of the most significant emblems (Fabris, 2004:38–39).

Used always with “noble” purposes, valued as an expression, described and reported both by writers and philosophers, the portrait raises multiple questions about its status. It is history or fiction? Reality or invention? Identity or otherness? “Photography builds a social identity, a standardized identity that often defies the concept of individuality, making possible to forge the most diverse typologies” (Fabris, 2004:15). But when we talk or think of portraits we are referring exactly to what? We often feel challenged by the Sphinx of Thebes: “Decipher me or I’ll devour you.”

Fabris also points out that for the French poet Charles Baudelaire (1821–1867) imagination is an essential part of a portrait: “The poet attributes to the portrayer a divinatory capacity, since it is his/her job to guess what is hidden, besides capturing what is allowed to be seen” (Fabris, 2004:21). For the German philosopher Walter Benjamin (1892–1940), the portrait falls into the realm of romance: “It is, above all, a product of the imagination, and yet no less true to the personality of the model”, as writes Fabris (2004:21).

In these almost 200 years since the invention of photography the portrait has always had prestige and was the subject of a number of analyses. Thus the amazement with the spread of selfies and of the idea that seems to be behind the importance of the self-portrait today, if there is a concept or a latent reflection in it at all.

It must be taken into account that this cult of the image and of the portrait is not recent. The Czech philosopher Vilém Flusser (1920–1991), in his book *Filosofia da caixa preta* (1983), points out the magical aspect of the image that precedes the technical picture. He speaks of the disappearance of the need for decoding a technical image (photography, film), since its meaning is imprinted automatically on the surface, like a fingerprint: “When photography becomes a model of thought, it changes the very structure of the existence, of the world and of society” (Flusser, 1983:73).

We seek similarities, memories, when we look at a photographic portrait. And not necessarily artistic or aesthetic originality. What we want is to unravel what that face means to us. Analyzing the relationship of the camera with the human face, Baudrillard makes of the portrait an act of defacement and stripping of the character of the model. Faced with the playacting that the individual makes of himself/herself, the lenses cannot idealize or transfigure him/her as image: capturing the similarity does not mean capturing the mask, the secret otherness that every being

carries. What Baudrillard demands from photography is just that: not so much “to search for the identity behind appearances”, but “behind the identity make emerge the mask, the figure” of what haunts the human being and diverts it from its identity (FABRIS, 2004:75).

The fascination of the portrait and the self-portrait is precisely this: its fictional character (as, indeed, of any photograph), the possibility of creating, of posing, the construction of any number of characters acting in each photograph. It is a way, as Fabris points out, to “dodge once and for all the existence of the original subject”.

We are all the time ritualizing and recreating a good part of everyday life. The roles alternate, and photography ends up becoming one of the means used to consolidate this idea and give concreteness to what we are seeing. Vision is measured by our knowledge, by our construction of the world from the representations. And the representations reflect or imitate the social reality.

The French professor and researcher François Soulages raises an interesting controversy on this subject when he asks whether the portrayer is a photographer or a photography director. He raises the possibility of a photographic dramatization, the change of concept from “this existed” to “this was played”: “Is the portrait a genre that gives the object ‘one (or several) human being(s)’ to be photographed or is its practice that produces a photographic appearance of a visible phenomenon?” (2010:65–66). And then he ponders: “The photographic portrait is full of close tensions and contradictions: does it really distinguish itself from photography, which would be, like painting, the competence of art? Maybe this is just a fact?” (2010:66).

If it is a fact, it is possible to analyze the contemporary selfie from the perspective of the entertainment society, or of a civilization of the spectacle, as defined the Peruvian writer Mario Vargas Llosa (2013).

In a society in which you’re worth something when you become visible, the rapid spread of an image via social networks allows for immediacy in the integration to a world of consumption, leisure and a “pseudo” way out of anonymity. If each period has an eye and a representation undoubtedly the 21st century’s is that of visibility. No matter how much or what we do for that to happen. Aesthetic relations that give us the impression of belonging when in fact they offer just traces: what about the civilization of the spectacle? It is a civilization of a world in which the first place in the current value raking is occupied by entertainment, in which having fun, escaping boredom, is the universal passion. This ideal of life is perfectly legitimate, no doubt. Only a fanatical Puritan could blame the members of a society who want to give playfulness, relaxation, humor and fun to lives normally engaged in depressing and sometimes stultifying routines. But transforming into a supreme value this natural propensity to have fun has unexpected consequences: the trivialization of culture, the generalization of frivolity ... (Vargas Llosa, 2013:30).

In the case of photography, it is always good to remember that building an image is never a copy of an external world, but the realization of the imaginary of a subject within a society, a culture, a given historical moment. Images that pass for social representations.

2. Representation and contemporary image

Social psychologist Serge Moscovici departs from the study of social representations to understand how and why humans act and think in a certain way, affirming the historic character of consciousness. In other words, how the subject is presented and represented through the images he/she builds when he/she wants to know and appropriate the world.

From the moment that the image becomes one of the main forms of knowledge and of transmission of this knowledge, we no longer live our experiences directly and start to experience them through the representations: “everything that used to be directly lived has become a representation” (Debord, 1997:13).

In our case, today knowledge or recognition passes through the selfie: when reflecting on the identity imprinted in photographic portraits, Roland Barthes refers to an imprecise, if not

imaginary, identity, often close to myths and stereotypes, to the point that it is possible to speak of similarity even in the face of unknown models. Questioning the identity of the photographed subject leads the author to a radical conclusion: the individual resembles infinitely the other images of himself/herself, he/she is a copy of a copy, whether real or mental (Fabris, 2004:115).

We have thus moved beyond the time in which the portrait and the self-portrait meant much more a discovery of identity or of affirmation in the world, a way to place ourselves in society as unique beings, to the selfie, a craze that, although somehow also inserting us into a context, leaves uniqueness aside and makes us all look the same. The same poses, the same smiles, creating a break between the subject, the self, and the image, which is increasingly featured as a pose. An imposed rule, in which the apparent spontaneity and the speed with which the images are disseminated through social networks lead us to believe in the authenticity of the portrait and the portrayed.

In a narcissistic society, in which little is produced and reproduced, selfies feature, as Umberto Eco (1984:60) would say, an “allegory of consumer society”, a false individualism, focused on the rapid achievement of the desire to be seen, to achieve visibility, and thus to begin to exist in a society in which image and entertainment are inseparable.

The forms of this neo-individualism centered on the primacy of self-realization are countless. Alongside the subjective autonomy, hedonism and psychologism, a new relationship with the body has developed: obsession with health, cult of sports, fitness, leanness, beauty care, cosmetic surgery... manifestations of a narcissistic society (Lipovetsky; Serroy, 2011:48).

There is no innocent look. Photography is always the construction of a representation. As Boris Kossov reminds us (2007:54), every photograph is a creation, “a testimony that materializes from a process of creation, i.e., construction. In this construction lies the aesthetics of representation.”

In the aestheticized world we live in, representation involves the immediacy of a fact and a situation. Today’s photograph, the self-portrait, is not intent to be more heroic, but rather an image that plays with banality. Selfies will probably be replaced soon by another representative form of the way we see ourselves and how we want to be seen.

Abstract

This article presents the Law while producer and disseminator of sociocultural discourse. The basis starts from the idea that language, here in particular the juridical language is notorious brand of culture and social relations, and after all it's the language that can express concepts, norms, behaviors, in other words, a condition that provokes relationships, actions and reactions. In that sense, the arising from methodological procedures of the American Semiotics Theory, commonly known as Peirce's Semiotics, will base the proposal based on the process of signification, or at best Peirce's terms, the process of semiosis that requires basically the philosophical model of pragmatism. The article takes as its theoretical basis of Tercio Sampaio Ferraz Jr., in this case, to contextualize the Theory of Juridical Norm. Moreover, extends the notes highlighting the way the study of law by the language, in terms of the Norberto Bobbio, in what concerns the function prescriptive.

Introduction

Many theorists have presented the idea that Law is not pure logic, which means that cultural, social, technological issues and politics permeate the reading of the facts and the formulations of laws. In the words of Gregorio Robles: “in social life of men, as communication system, the law is language or, in other words, the law is text” (2005, p. 2), and while text is subject to interpretation, as yet, condition *sine qua non* to produce other texts.

To Bobbio, the author thinks he can distinguish three fundamental functions of the language of Law, namely: descriptive, expressive and prescriptive. Therefore, confirming that it is in the language that Law exercises its own sociocultural discursive function.

In this sense, the text and language conceptions transcend what are routinely reserved to them in the common studies. Therefore, the proposition bases on semiotic studies, in particular, the American Semiotics, also known as Peirce’s Semiotics (foundation by Charles Sanders Peirce (1839-1914), to broaden the debate.

The work starts with the presentation of what is Semiotics and the object of study of this science. Then, it refers to the sign, the language and the process of semiosis and then conducts the issues and/or themes in relation to Law and its relations with the world, society and culture.

And to justify that the endeavor is bold, we brace on the same words of the learned teacher Tercio Sampaio Ferraz Junior (2009: p. 1): “the undertaking to carry out even an outline, of a pragmatic normative legal communication takes a certain audacity and great risk. This is because the very notion of pragmatics is quite imprecise [...]”

Thus, the pragmatic becomes the focus of the work, therefore, conceived as a dimension of semiosis is part of a theory of Peirce’s Semiotics, whose idea is the study of the sign related to their interpreters.

Once this phase is overcome, the place for the sign and the socio-cultural reality is reserved, whose configuration of the *do-do* (constant in the prescriptive function) cannot stop being span by the mode of *do-say* from Law as a communicative act in order to achieve in the recipient of legal language some *do-know*. Because the language, in this case the one used by Law, places symbolic exchanges that allow communication between the subjects and that generates social relations or even interrupt, modify or change behaviors when needed.

The propositions based on work of Norberto Bobbio (1909-2004), *theory of rule of law*, are extended precisely because the author elaborates the thought about Law in the parameters of the functions of language. That is, we are interested in fixating on the prescriptive function without greater pretensions (such as previous approaches), because it is Bobbio’s conception that the prescriptive function modifies the behavior of others. Thus, the function of the prescriptive language makes real the *do-do* of the subjects.

This attempt joins the requirements of interpreting legal norm through the studies of language to foster, in the words of Paul de Barros Carvalho (apud Bittar, 2010): “[...] the possibility for the public, with distinct formations, not only legal entities, can understand and identify interfaces between communication codes and the legal system”.

1. The Semiotics as a science of languages

To understand the role of law, we need to talk a little bit about the functions of these social discourses. According to Landowski *apud* Zuin (2012: p. 10): “all social discourses have a main or primary function. Most social discourses have a character eminently pragmatic (Landowski, 1992), that is, seeking to satisfy some practical need of the human being”.

In the same way, Bobbio formulates that a legal norm is a proposition:

We mean that it is a set of words that have a meaning. Based on what we said above, the same normative proposition can be formulated by varied enunciations. What matters to the lawyer when he interprets a law, is its meaning.

[...] There are various kinds of propositions. You can tell them apart based on two criteria: *the grammatical form and the function*. [...]

[...]

I believe that it is possible to distinguish three fundamental functions of language: *the descriptive, the expressive and the prescriptive*.

[...]

We are interested particularly in the prescriptive function: a body of laws or regulations, a code, a constitution, these constitute the most interesting examples of normative language [...]. (Bobbio, 2014: p. 74-79)

It is observed, if found according to Landowski (1992) the main or primary function in social discourses in order to satisfy any practical need of the human being, it is possible to say, then, that to Bobbio, in this line of thought, the function of prescriptive language aims also to satisfy practical social issues, such as: informing, communicating, transmitting knowledge etc. After all, as Bobbio asserts, the prescriptive function is propriety of the normative language, because it implies while it influences the behavior of others, tending to transform it, using for that the *performance* which is its characteristic: the *do-do*.

Now, before the *performativ do-do* it is necessary first a *do-say* – present in the communicative act of law to society. So that the individual can be influenced and receive properly the targeted communication, ensuring the intelligibility of the message by an effective process of formulation and transmission, as provided in the law norms, the recipient “needs to believe”, “to assume” and take it as credible; There it is what makes it worthy of credibility.

That means in the words of Bobbio (2014: p. 48):

[...] the first point which, in my judgment, is necessary to have clear in mind if we want to establish a theory of the rule of law with solid basis, is that every legal norm can be subjected to three separate appraisals, and that these appraisals are independent of each other. In fact, before any legal norm we can put a triple order of questions: 1) if it is just or unjust; 2) If is valid or invalid; 3) if it is effective or ineffective. These are the three distinct problems: the justice, the validity and the effectiveness of a legal norm (emphasis added by the author).

Thus, in the order of law, although the prescriptive function aims at the objective of disciplining social coexistence, the guidelines of positive law (nomoempírico prescriptive system) also demands conducting the conduct of social subjects, in order to modify their behavior. Hence, saying that the law as a socio-cultural discursive practice is imbued, according to Bobbio, with characteristics residing in the prescriptive propositions, and yet in the pragmatic of Tercio Sampaio Jr, in sight of the law being here a place of communicative act. To Zuin (2009: p. 152) that is also presentified in the action proper of language, which is: the persuasion, because in order for the rule of law to be effective it is necessary and ongoing the act of persuading or continuing to persuade, in any communicative context.

When it comes to the rule of law, in this case we are forced to recognize the modal value

of doing, which to Greimas & Courtès (2008: p. 202) is “an operative (do-be) or manipulative (do-do) *do*”, given that it is a doing that modifies the behaviors, transforms and rules other statements. By the framework of Ferraz Junior this mode of *doing* is in the *pragmatic doing* and may extend into *cognitive doing*. It says “may” in the sense that by the nature of *pragmatic doing* there are investment of socio-cultural, descriptive values, therefore, understanding the law as socio-cultural discursive practice, because it is invested of programs of *persuasive doings* and *interpretive doings*.

So, by being the place of communicative act, the mechanisms and procedures of structuring of the legal language, treating it as a totality of meaning, are guided by the ways in which the norms are organized to produce certain values of “certain society”, without, however, disregarding what keep or modify them, in the socio-cultural context.

2. Law as discursive sociocultural practice

Several researches have presented the establishment of links between Peirce’s semiotics and the legal language; in other words, researches are gradually driving the contribution of semiotics to a theoretical linguistic and methodological meeting, looking forward to generating a interdisciplinarity among its fundamental principles. And what are these principles? The basic principles for the establishment of these relations are found in the Semiotic Theory of perception, of the sign and the interpretant. It is precisely in this contribution that we can get the answers for the effective understanding of the ways in which the meanings are transformed into cognition, i.e., it is in the interpretant theory that we can find the understanding of the mental processes, the production of cognition in the minds of interpreters.

Nöth (1995, p. 130) draws our attention to the way in which the phenomenological categories of experience developed by Peirce, the *cognition* is understood:

On Peirce’s philosophy, the traditional triad of mind corresponds to its three categories of Firstness, Secondness and Thirdness. The feeling belongs to the Firstness, the category of the immediate and of the qualities not yet distinguished. Volition belongs to Secondness, category of dyadic interaction between the self and the other (the first and the second). Cognition belongs to Thirdness, the communication category of representation “between a second and a first”. (CP 5.66)

Consequently related to this phenomenon is the proposal of Tercio Sampaio Ferraz Jr. (2009: p. 7) mentioning that it is not enough to the study to be based in linguistic aspect, considering not being the purpose “study the language of Law or its normative manifestation; but investigating Law itself, while required, for its language existence”. Therefore, Law is taken to the linguistic level, without however, dismissing from the investigation what is competence of the legal standard, the regulations of behavior, the possibility of conflicts, the immanent characteristics that lead us to another level, that here is presented – the discursive level. After all, asserts Ferraz Jr. (2009, p. 8): “On behalf of the laws of the regularities of language proceeds usually an investigation of the political discourse, philosophical, scientific, etc”.

And under the normative point of view, in the words of Norberto Bobbio (2014: p. 25) Law as a rule of conduct:

Approaches the legal experience and apprehend its characteristic features is to consider Law as a set of norms, or rules of conduct. Let us begin by a general statement of the genre: the legal experience is a normative experience.

Still to Bobbio and correlated to the assertion of Ferraz Jr (2009) that more important than studying the language of Law or their normative manifestation is to investigate the law itself, while requires, for its existence, of language, goes for the studies of law as a rule of conduct to capture the senses of modes like “our life develops into a world of standards” (Bobbio, 2014: p. 25). So, in the world of standards is worth even the subject’s experience with respect to the standard he established, otherwise nothing will mean, why didn’t went through own *legal experience* of which proposes.

So, although I need the subject’s experience with the world of life so that he can put himself in the communicative act and understand the meanings of the standards that you are put, rises in autonomous and heteronymous imperatives considered by Bobbio (2014: p. 91), a paradox to this positioning; yes, the category of *requirements* of legal order is very large, because they understand both the moral rules as the rules of grammar, both legal norms as a prescriptions.

This implies a change in the paradigm of Habermas, given that in the relationship of the subject with the cognitive object present in the theory of communicative action there is the predominance of free and public use of reason of the subject about the object, given the idea of subject-subject relationship for effective discursive formulation. However, what is formulated by the prescriptive legal language function, in the words of Bobbio (2014: p. 91) in this area is not discursive.

In this extension, Law shall become a phenomenon predisposed to each generation, group, culture or even individual, which depends on the development, establishment and access to content, the standard; once, to understand the legal world every culture has its unique way of expressing it and interpret it, i.e., each of which has the experience related to the world of life, although the proposition too prescriptive with regard to binding force.

[...]

So far, talk of imperatives (or commands). But the imperatives (or commands) are those prescriptions that are more binding force. This greater binding strength is expressed by saying that the behavior predicted by the imperative is required, or in other words, the imperative obligation to generate a person to whom it is addressed. Imperative and obligation are two correlative terms: where there is one, there is the other. One can express the imperative in terms of obligatory action-object (Bobbio, 2014: p. 97)

However, to Bobbio is not thrown that mostly this implies a veiling that’s behind the legal language, i.e. the prescriptive function which aims to:

presuppose knowledge of function that has the normative system to characterize a given society, and cannot be answered except through the study of the rules of conduct that have shaped the lives of those men, distinguishing it from the lives of other men, belonging to another company inserted in other normative system (Bobbio, 2014: p. 27).

In another contribution:

We believe to be free, but in reality, we are involved in a very thick network of rules of conduct, from birth to death, heading in this or that direction our actions. Most of these rules has become so habitual that we realized more of his presence. However, if we observe a little, outside, the development of a man's life by nurturing activity exerted by their parents, their teachers and so on, will realize that he develops guided by rules of conduct (Bobbio, 2014: p. 26).

In this same sense are content-related issues of mental representations of which are of the utmost importance for the Legal Science, therefore, to understand the Law interpretive possibilities is required; because the idea of pragmatic communication acts priority is only validated from the decision to put in a speech and in communicative situation, using the terms of Fernandez Jr. (2009: p. 12). And amplify, even the standards of conduct that are part of the prescriptive function intend to highlight positive or negative imperatives of both species, without, however, fail to target the legal rigor formulated experience, because they are of linguistic signs that talks. In this line, in the pragmatic dimension is the Constitution that may be significant for the legal language, why is it that people drive in the purposes of prescriptive function, whether spontaneous or compulsory membership of the selfsame thought may be the norm.

So, say that the law aims to "regulate social conduct admissible" not exempt, greatly to conceive such dynamics in the molds in social events circumscribed. On the contrary, while producer of discursive socio-cultural, as is provided for puffed admitting the complexity of human phenomena, which are: economic, social, cultural, philosophical, communicative, etc. After all if it were not the fundamental question of law would be lost, because there would be a fundamental in Exchange point. Is given to this rationale that Ferraz Junior points towards communicative situation. And in this mat is based the principle of Peirce's pragmatic, given the privilege of this dimension to the semiosis, considering how the author emphasizes, the norm as linguistic fact, incorporating the ludic dimension (Fernandez Jr., 2009: p. 12). Deserves quoting in terms of Ferdowski: "other dimensions: syntactic and semantic aspects relevant to studies of the legal standard, but stresses be pragmatics the deprecated due to the principle of interaction" (2009: p. 30).

And we add, if Law whose capacity for mediation is formalize the symbolic universe of legal order, for recognizing the man how to be "symbolic" and as such, unlike other animal species by the condition of seizure of the senses to the highest level of abstraction, the experience from this symbolic formalization, actually seized and perceived, is capable of transforming the mental world psychological, socio-cultural, and receptor interaction. Under Ricardo Souza Pereira (2012), here are the reasons why the option by the pragmatic point of view to the approach of the legal language, because if on the one hand is the very function that you intended – to prescribe, sanction, force, from the point of view of semiosis as the filing of Ferraz Jr.

As for the design of the pragmatic point of view, objective this study to be a facilitator of communication between he who emits the norm and the recipient of this, it might just be a standard receiver. However as pragmatically the end is reached, it ceases to be a mere receiver, however, to become knowledgeable of the same, which makes the Act of language, much more effective.

And likewise Law as discursive practice, socio-cultural that shall assume the function of bookie-human relations, because communicational conceives not only language and the signs as investigation of semiosis, but the interaction that conceives as media with the selfsame thought may be. For this understanding takes Carlos Eduardo Bianca Bittar which teaches:

Then one realizes that the corporeal presence of law is not as unitary, nor as homogeneously; Notice that Law something is missing when it is extracting their socio-cultural substances, expressive, discursive, politician-squeeze (...). If so, then you're faced with a phenomenon that coexists with other phenomena, some depending on other intrinsically, extracting its articulation, on others if structuring, with others living dialectically, etc. To this end, and Law at this very moment, opens a new vision for what is the reality of Law, a sense that no appeals to that artificial reality [...] (the author's original spelling). (Bittar, 2003: p. 15).

In that consent Bittar complements:

On the other hand the discursus is the use of rationality depurative of ideas, opposed to the notion of intuition (noésis); o discursus involves the cursus a proposition to another, so that all reasoning is conditioned by this route. On the other hand, the speech is understood as being logos, i.e. the transport of thought (noûs) eidetic structures to the sphere of communication, the use of the noûs in articulation of language. The logos, in fact, is the noûs done in Word, which is to say that there is a passage of the symbolic abstract and symbolic thought of noetic and the formation of ideas, for the symbolic and expressive concrete (the author's original spelling). (Bittar, 2003: p. 71)

Consequently, the process of signification (semiosis) is present on narrativity of mediations not at random, to the extent that mediation is a semiotic process-discursive, so is the process of narrativity, as a cognitive mental map not merely narrative. Because, in this map the narrativity is a property that characterizes a certain kind of speech (Greimas, 2008, p. 328), in this case, the discourse of law who writes and/or subscribe to the way in which social subjects must *know-how, could do, and should do* the discursive communication situation in legal culture, in history, in society. This model although abstract is justified to the extent that the normative Communicator (Fernandez Jr. 2009, p. 43), in this context, also happens to assume different positions within other social discourses. There are rooted the bases that make up the phenomenon of law while practice cultural discursive.

Final considerations

The Semiotics developed by Charles Sanders Peirce, conceived as logic, cannot be confused with an applied science, in the words of Santaella, whereas Peirce was effort to configure general confiscation signal concepts of the senses from the abstract-formal procedures. Meets retain in this line that the theoretical procedures of Peirce contributed to the advancement of American pragmatism, once through the triadic scheme of the sign, very different from the dyadic model of Ferdinand de Saussure, allows the relationship of semiosis (meaning) that designates an action; or an influence that supposes the cooperation of three subjects in the process: the sign,

the object and its selfsame thought may be.

This idea occurs the action of man in the world, even if only by the full experience, whereby he will call Firstness, which is nothing but things out of place or of any material (Aguilar, 2004: p. 47). However, good and takes into account the character of the sign and triple action first, because it is then a second – the Secondness that occurs by contact with something that requires a modification to the reactions, the aspect of mutual relationship. Thus, in transaction, as proposed by Araújo (2004: p. 47), Peirce mediation occurs or for modification of Firstness and Secondness, and at this level occurs the communicative processes.

Law fit in this third dimension, because it represents something that provokes, urges, modifies, persuades, creates mediations typically and genuinely features of your communicational situation, i.e. normative representation while is represented, because habit, growth, diffusion, memory, intelligence, cognition follows its Constitution deontic to argumentative validity consequently discursive. By Charles being implies the mind of another interpreter generating *sign equivalent or more developed* than Peirce (1972, p. 94) entitled as *selfsame thought may be*. And, with all this determines, the pragmatism of Peirce was presented by notorious: “the characters of all signs used by a *scientific intelligence*, that is, by an intelligence capable of learning from experience” (1977, p. 45), constitute a kind of abstraction along with the note. (Aguilar, 2004: p. 54). The Law in this area, while the third category concerns “or mediation process, continued growth and future always possible by acquiring new habits” (Santaella, 2003:p.39), standards, customs, nod, Convention, situation of communication/interaction; because through Law if represents and interprets the world of laws; is the layer of intelligibility that demand in the profusion of cognitive.

The Peirce’s Semiotics in the area of law, is a field of knowledge in development that seeks to understand the processes of signification that permeates the legal discourse. As a specific semiotics can be applied to the processes of cognition that proposes to replicate, given the cognitive potential of the human species.

In short, these approaches came to the pragmatic dimension by the fact that the complexity of discourse if appeals to the understanding of others, in the words of professor Fernandez Jr. in this context, what gives meaning of your unit is the possibility of pragmatic speech, that is, the rules make up a unit due to the possibility of fundamenting discursive behavior (Ferraz Jr., 2009: p. 20). Finally, under the angle of Pragmatics of discourse, as the author asserts, interests manifest themselves through values (2009: p. 151).

If to Norberto Bobbio prescriptive legal language function meets what you propose, that is, modify the behavior of the individual, also influence the ways as he welcomes, in this case the plays through the cognitive mechanisms, even if indirect mode, while prescription influence is direct, which means that is the language that the selfsame thought may consent in *do-do*. Or, as prescriptive function permeates the dynamics of heteronomous imperative, given that comes out of the sphere of Kantian morality: *the autonomy of the will that is the quality that has the desire to be the law itself*; toward the legislator’s speech, because *This is internal, moral legislator and legal is external*, as accentuates Bobbio.

Law as discursive practice would not change socio-cultural, since in the discursive function pragmatically immanent here contains, tell us of the Ferraz Jr.: “observations that lead us to conclusions unsatisfactory about the legitimacy taken as a justification problem last normative discourse”. (2009: p. 172).

Because, as the author (2009: p. 172) even says: “his character of endless game shows, by analogy, that any attempt to require recent standards, able to decide without any redress, on the” smoothness “of the game, about whether the game is still being played or if it is being done only in appearance, requires criteria that are not within the system, but somehow, out

of it". Well, so therein lies the placement of every speech is endowed with ideology, and given the impossibility of leaving the ideological limit, it does not give the right to become irrational and accessible the legitimacy of legal discourse, considering that for formal pragmatic need to allow participants the communication understand each other about something that the world puts; soon, culminates in the proposal for a new rationality, understood as provision of subject capable of producing and grasp the meanings of language-cognitive process, while enabling the social order.

Finally, as a producer of cultural discourses is also able to manage the *competency* of the individual in order to lead you to a *know-how* choices, analyze, share, but, above all, experience it with ethics and critical thinking. Therefore, an experiment of knowledge, which would boost the perception of culture and would relativize the standards and values of the norm of each society, taking into account the *know-how* which, moreover, understands the aesthetic experiences and stestic of this same society.

SEMIOTIC CHOICE AND TERMINISTIC SCREENS AS SEEN IN CROP CIRCLES

Jonathan Griffin
University of Tartu, Estonia
JGrantGriffin@gmail.com

Abstract

What is a crop circle a sign of? Responding to this question from a semiotic standpoint requires no specific conclusions from us regarding crop circles' origins. What is interesting for us here are the multiple but mutually exclusive possibilities for understanding what a crop circle is a sign of. We find logical boundaries according to which different semiotic options arise, such as 'entirely human origin' or 'not entirely human origin'. Under such logical bifurcation, we find further bifurcations which also serve as mutually exclusive options. This logical geometry tells us, perhaps, nothing about the actuality of events, but it does tell us something important about possibility, which in this sense should be seen as semiotic possibility. That is, for this dimension of possibility, we see the irrelevance of judgments from present-day physics, modern cosmology, and the like. A semiotic way of looking uncovers this logical dimension for sign possibility that we negotiate as we navigate what we encounter of the universe and as we seek to understand it. In Peircean terms, within experience we seek to work out some interpretant which will fix the *crop circle as representamen* to some object. Since multiple ways to do this exist, we find semiotic choice in some sense. Depending on what choice we make, subsequent semiotic possibilities for our world of experience will arise – certain new ones opening up and certain others being precluded. That is, a kind of semiotic filter (what Kenneth Burke called a terministic screen) will then “color” our experience and establish what we might think of as a trajectory for it. While many of us already have such filters in place which preclude for us the semiotic possibilities available in crop circles (or any other percepts), we can still see broader sign pluralities in their logical dimension and how each of them has a particular geometry for

shaping future experience. These semiotic choices we make form a greater terministic screen or interpretant according to which we order our worlds and direct our lives. We are speaking here of a form of analysis that we can use to look closely at the semiotic choices we make, the filters that arise from them, and the kind of lives that emerge as we sustain such trajectories.

Opening Remarks

What is a crop circle a sign of? This subject may set some teeth on edge by its very nature, but asking this question with a semiotic intent does not require us to speculate on the actual origins of such objects, or to be concerned about questions of alien life. While those may be worthwhile, our focus will be the sign possibilities for crop circles and how we go about making such a semiotic choice. So even though this subject is likely to be approached with either a passionate embrace or an automatically skeptical attitude, let us keep firmly in mind that we are not concerned one way or another with discovering crop circle origins. Regardless of our conclusions about that subject, the issue of semiotic possibility and how we navigate this may be relevant for us.

What is the current crop circle situation?

We should state early on what is meant by *crop circle* today for anyone who is unclear. In brief, the bulk of these formations began to appear in the second half of the 20th century, increasing in frequency during the progression from the 70s to the 90s, though precursor formations did appear earlier. While the term *circle* is still used following earlier patterns, these structures today often move beyond purely circular shapes. In fact, the complexity and the information content of these formations have increased significantly, apparent in the large 2001 Milk Hill formation comprised of 409 circles. Many people seem unaware of this complexity and have a much more basic idea of crop circles, which can lead to overly simple hoax explanations.

The epitome of such explanations came in 1991 when Doug Bower and Dave Chorley surfaced and publicly claimed that they were the ones behind more than a decade of crop circles. The method they hatched was to use wood planks, a rope, and a hat fitted with a wire to keep a straight line while pushing crops over. To demonstrate their method, they pressed out a rudimentary formation. This method can indeed account for some formations. Nevertheless, Bower and Chorley's claims (if true) are insufficient to cover either the sheer volume of such structures or the complexity and forensic evidence found in many.

One scholar with some interest in this topic is Richard Taylor, physics professor at the University of Oregon and director of their Materials Science Institute. In an article written for *Physics World* in 2011 ("Coming soon to a field near you"), Taylor mentions a "Triple Julia" fractal pattern formation that appeared overnight in 1996, and he says that even in the more than 15 years since, "scientists still do not know the answer" to how it was made (Taylor 2011: 26). After all, he says, contemporary "crop-circle designs are more complex than ever featuring up to 2000 individual shapes arranged using intricate construction lines that are invisible to the casual observer" (Taylor 2011: 29). He speculates that part of what makes this possible is access to computers, GPS, and lasers. In addition, some methods of bending stalks also appear to be inconsistent with simple force. Forensic evidence points to radiation exposure. The pulvini (or visco-elastic joints) on plant stalks "were elongated compared with undamaged crops in the same field" (Taylor 2011: 29), apparently the "result of superheating from electromagnetic radiation" (Taylor 2011: 30). Taylor's own position is that this phenomenon is a fascinating art movement that now uses microwaves. He once guessed in an article for *Nature* that masers or magnetrons may be involved. Given his concern that long-term damage is being done to crops and our food supply, his indication that scientists do not know what technology is behind

these formations reveals a real indeterminacy in this phenomenon, which opens up the field of semiotic possibility.

Contributing even further to the indeterminacy in this case is the fact that whoever is behind these creations does not step forward. For whatever reason, those responsible do not claim these often masterful works, even though people tend to want credit for such. Accordingly, Taylor's confident conclusion that human artists are responsible is not at all a given from the field of possibilities itself. The nature of the agents and their motives is not certain in the absence of more direct observation. Taylor's conclusion is in some sense a choice, a guess from a range of possibilities. Certain conclusions may be ruled out for him in principle from the outset. After all, the indeterminacy automatically leaves open multiple possibilities at a logical level, and thus semiotic possibility is compounded.

Semiotic Possibility

Intersecting with this dimension of indeterminacy, though, is a plane of logical incompatibility or mutual-exclusivity that brings stability to semiotic possibility. When we ask the question, "What is this crop circle a sign of?", we have a certain intelligible range of mutually-exclusive options. This is especially clear in relation to the crop circle's origin. Perhaps the first major plane of possibilities is Life or Non-Life, whose single case would probably be some natural force or process. On the other hand, the incompatible possibilities under Life are much broader. The first logical distinction, it seems, is between so-called Intelligent or Non-Intelligent life, with "intelligent" as shorthand for anthroposemiosis capacity. And so forth in further distinctions.

These origin possibilities have logical dividing lines between them and are thus incompatible or mutually-exclusive. In "Catalysis and scaffolding in semiosis", Kalevi Kull describes this dimension of "*incompatibility* as a fundamental precondition for semiosis" and as "itself the source of indeterminacy" (Kull 2014: 118). He makes clear, too, though, that it also brings in logical clarity, for "the simultaneous application" of two exclusive possibilities "would lead to logical incompatibility" (Kull 2014:118). In this way, incompatibility gives a clarity to the semiotic possibilities without resolving any questions of indeterminacy. There remains the question, then, of how the various semiotic possibilities get collapsed into specifics – that is, how are meaning choices made? In the presence of various options that have not been collapsed by direct observation, how is it that we come to establish that a crop circle indicates one thing rather than its converse? Given the wide range of possibilities, how do humans actually affix some particular meanings rather than others that they exclude? Answering this question thoroughly would require more time than we have now, but hopefully we can make a good beginning.

Terministic Screens

We should recognize here that whenever we encounter even our first crop circle, we may already have certain semiotic possibilities excluded from our view. That is, in terms of logical possibility, the formation may have been created by a non-human, extraterrestrial life form. Nevertheless, if we have concluded against the existence of such life forms in our previous semiosis, no such sign possibility will appear to us. It will be, in effect, screened out from the beginning. No such option was even considered and then ruled out. Kull has described this process as "singularization", saying that "a sign may become very rigid, which means that the plurality of meanings has decreased and can ultimately collapse into a single meaning. Then the process becomes automatic (mechanical)" (Kull 2014: 118). The resulting role such fixed meanings play in our subsequent semiosis overlaps with what Kenneth Burke means when he speaks of terministic screens. He tells us that every time we choose some terminology for understanding the world, we necessarily make "a selection of reality, and to this extent it must

function also as a *deflection of reality*" (Burke 1966: 45). Burke has in mind the way a colored lens filters a photograph and reveals some textures rather than others, directing the attention in some specific way. Certain semiotic possibilities emerge for us while others are filtered out.

The semiotic choices we have previously made screen out other meaning possibilities, and these screens are in place even as we encounter new situations. Certain planes of meaning are no longer even options, and the meaning landscape morphs for us, thus also shaping experience—that is, what that experience *will be like*. And inasmuch as volition is always involved, the vast panoply of our motivations play a role in what semiotic decisions we make and what meanings then arise. Our desires, our commitments, what we refuse to see or not to see – all these play a role in how we build our own experiential world. So if we encounter a crop circle embedded in sufficient indeterminacy to support multiply incompatible conclusions, the semiotic choices from our life so far may at the outset restrict the field of potential meanings so that our present conclusion is a given – not from the present situation's evidence but with our terministic screens providing the primary evidence. If, perhaps, we encounter this crop circle without having made any relevant semiotic choices in the past, any choices we do make about what this crop circle is a sign of will then shape subsequent semiosis and color experience. For instance, once I have decided that all crop circles are the work of aliens (or hoaxers), I am likely to automatically filter experience accordingly. It will take a substantial challenge to my conclusions to cause a reworking of my filters. And the longer they are maintained, the more difficult they are to restructure.

Concluding Remarks

It should be clear, now, that we see here a general theme with implications far wider and more important than how we see crop circles. Rather, the way we make sign choices when given any semiotic indeterminacy and possibility will restrict what meaning can actually exist in our world. And this will shape *what it is like* to be in that world. But this will also have an impact on the semioses around us. When we make semiotic choices toward the most destructive possibilities, we help create that world. In so doing, we might even preclude all but the more destructive options for others, thus coloring their world of experience in darker terms. But for semiotic creatures, inward realities shape outward ones as we corporately build objective structures. In viewing a crop circle, some of us may find certain options of meaning excluded at the outset, and maybe that is okay. It is how we learn and grow as bounded-rational creatures. But since meanings shape both inward and outward experience for ourselves and for others, we have good reason to stand in vigilant watch over what kind of world our screens help to create.

Abstract

The proposed case study aims to discuss the ways and roles in which the female figure is represented in postage stamps produced in Cyprus, after state independence in 1960. While female role portrayals have been examined in the local culture in the forms of lifestyle magazines and radio advertisements (Maniou & Photiou, 2013), the potential interest of a postage stamp analysis has been overlooked. However it is important to note, that the social role of women of Cyprus is documented and analysed using theoretical framework in a number of studies and books. The current study is based on the notion that ties the importance of the selection of postage stamp representation with a nation's profile. As Bushnell argues (2011), the postage stamp designs produced in order to represent a nation's image are chosen following decisions essentially made by formal committees of experts and civic personalities. As a result, the figures and symbols recruited are obviously "revealing to one extent or another political and cultural values in a society". In the analysis/interpretation of the data a combination of methodologies was employed, namely content and semiotic analysis. A sample of 158 plates was selected from a corpus of 1.121 postage stamps printed from 1960 until 2013, all of which feature at least one recognizable female figure. The starting year 1960 stands as a landmark in the island's history

and it signals the beginning of state independence. The postage stamps, as well as information regarding their production, were collected from the Cyprus Postal Museum and the Cyprus' Ministry of Communications and Works publications. Upon close examination of the female iconography on the postage stamps the research reveals a strong preference for specific roles, intricately related to the country's socio-cultural context, including religion, heritage and prevailing social norms, but also to specific historical experiences and national imaginings.

1. Introduction

This paper proposes a closer examination of the female roles preferred in the case of Cyprus postage stamp design, starting from the landmark date for the island's history – 1960 (state independence) – until recent years, more specifically 2013. The researchers have collected a corpus of 1.121 postage stamps in total, including definitive and commemorative issues. The rationale behind this selection is based on the historical background of the country. The year 1960 was chosen as a proverbial starting point, because it marks the end of the colonial period and the start of Cyprus's history as an independent state, following the Zurich agreement signed on the 16th August of 1960.

Upon this agreement, the newly-funded Republic of Cyprus began printing its very own postage stamps. The three first designs were presented on the very same day that the Zurich agreement was signed (Castle 1987).

It should be at this point noted the role and importance of the postage stamp and consequently its design for a country's status, especially when we are discussing newly funded states. Although, the postage stamp seems to be a neglected medium of research in comparison to a country's official touristic branding, its flag or even numismatics, can and should be read as a text with significant political purposes transmitted through the images they depict (Deans and Dobson 2005). The stamps are a provider of national identity as they are simultaneously government documents and representatives of the country, which they have been published as symbols of the state's "official culture" (Osmond 2008). While, postage stamps are to be considered a strong vehicle for the transmission of national identity they have also recently been acknowledged as objects of popular culture (Child 2012).

The principal motivation that encouraged this study was the lack of substantial and rigorously documented bibliography as far as Cyprus is concerned, both, regarding the field of postage stamp design as well as female representation in stamp design. However, it needs to be acknowledged that role portrayals have been examined in the local culture in the forms of lifestyle magazines and radio advertisements in recent years (Maniou and Photiou 2013).

Moreover the social role of the Cypriot woman has been discussed using theoretical frameworks in a number of studies and books, such as *The Cypriot Woman: A Research* (Milona et al. 1982). The specific work is quite seminal and has been the base for a number of studies concerning the island. It investigates the psychosocial conditions in the country through the years, attempting to gain a deeper understanding of the Cypriot mentality in respect of the woman's social role and status.

We are attempting to link our findings with the social status of women in Cypriot society as this is documented and shown in relevant theoretical framework. Interestingly enough the publication of Cyprus's first postage stamp came in parallel with the decision that the women of Cyprus are guaranteed to have voting rights equal to those of men (Γεωργίου 2013). Interestingly, Koliou (2006) remarks that the patriarchal model is still quite dominant in Cypriot society and this is evident both within the institution of family and general society practices as relevant studies show.

2. Literature review

A rather small amount of researches concerning the portrayal of women on stamps has been documented in worldwide bibliography although the findings are without a doubt enlightening.

Theorist David Bushnell (2011) traces the development of “philatelic feminism”, regarding Argentina, Colombia, Cuba and the United States of America in his own study. The author argues that while a country’s postage stamp design actually constitutes a bureaucratic decision, it can reveal and even influence political and cultural values in the range of a specific society. Bushnell finds a significant increase in the usage of female figures in the postage stamps of the United States and Cuba, especially after the 1940’s. Also a lack of international female figures in the United States postage stamps and diversity in the representation of professions is documented. In contrast, countries such as Cuba and Argentina tend to use more international figures instead of native famous personalities. Bushnell believes that the decision of placing an actual female figure on the postage stamp design constitutes a general recognition of feminine accomplishments in the past century and also an effort to be seen in a favourable light not only by feminist movements, but additionally by the general female population of the country. While this may be true let us not forget that feminine figures were and still are employed countless times to represent allegories, with liberty being one of the more popular ones in various countries.

Ogletree, Merritt and Roberts (1994) in their study *Female/male portrayals on U.S. postage stamps of the twentieth century* have found that gender representation on the United States’ postage stamps is consistent with the general tendencies of female/male portrayal in other forms of media, throughout the 20th century. As could be expected, male oriented representations are predominately more; the traditional role representations are significantly higher than non-traditional ones, but note a small decline concerning the traditional male portrayals after the 1980’s. According to the authors, the findings indicate a general awareness towards gender bias and this fact alone reflects views formulated in the specific society under consideration.

3. Method and definitions

The entire corpus was studied without sampling taking place. The reason for this decision lies in the framework the authors wanted to investigate, that is all the postage stamps issued by the Republic of Cyprus since its independence till present day. The researchers have chosen to include both definitive issues as well as commemorative. The term “definitive” refers to a postage stamp that belongs to the regular issues of the state, it is sold by all the post offices within the country for a long period of time and it serves everyday postal needs. On the other hand, a commemorative postage stamp is issued by the state for a limited time period in order to commemorate or honour an important person or event (Carlton 1997).

The authors have taken a sample of 158, clearly depicting one or more female figures. The criteria for this choice were for the representation to be easily recognisable as female, thus excluding portrayals that did not possess any easily understandable female characteristics. Furthermore, the researchers did not consider stamp designs that simply reproduced earlier postage stamps depictions for the coding to be valid.

The 158 postage stamps selected to be included in the research were divided into twelve categories, rated by two coders separately. An inter-rater reliability analysis using the Kappa statistic was performed to determine consistency among the two coders. The inter-rater reliability for the coders was found to be Kappa = 1.000 ($p < .001$), 95% CI (0.078, 0.182) (See Symmetric Measures, Appendix A).

The categorization was based on the relevant study of Ogletree, Roberts and Merritt (1994), although, it had to be modified in order to accommodate the main topics that emerged from the corpus. These categories are the following:

1. Individuals
2. Religion – representations deriving from Greek Orthodox religion
3. Greek Mythology – female representations featuring or inspired by the sphere of Greek mythology
4. Allegory

The particular category was further divided into two subcategories:

CATEGORY	QUANTITY	%
Individuals	14	8.9
Religion	64	40.5
Greek Mythology	30	18.9
Allegory	3	1.9
· <i>Symbol of beauty</i>	1	0.6
· <i>Symbol of freedom</i>	2	1.3
Spouse and/or parenthood	8	5.1
· <i>Motherhood</i>	5	3.2
Education	1	0.6
Historical events	2	1.3
Social themes	6	3.8
· <i>Refugee</i>	4	2.5
Professions	6	3.8
Women in sports	4	2.5
Traditional Culture (Cyprus)	14	8.9
Other	6	3.8
TOTAL	158	100

Table 1: Numbers and percentages of female representation by stamp category

According to our results the overwhelming majority of female representations were found mainly in stamps illustrating religious themes. The number is 40.5%, out of which 59 solely focus on the portrayal of Virgin Mary, while the 5 stamps remaining show Saint Lazarus's sisters. Other anonymous female figures depicted on religious scenes do not hold significant roles (anonymous female figures).

The second largest category was predictably the one associated with *Greek Mythology*, 18.9%. The design of these postage stamps is influenced by various myths deriving from the Ancient Greece, concerning the nature of the world in the form of stories about native gods and heroes attempting to explain universal mysteries in a semi-didactic manner. Aphrodite the goddess of love and beauty is the one that holds higher position and appears more often in contrast to other mythological female characters (10 of 30 postage stamps).

The next category entitled *Individuals* is represented by 8.9%, and presents particular interest due to the fact that depictions showing actual Cypriot women are very few. Only 3 out of 14 images contain a female figure that could be a Cypriot, whether celebrated or anonymous. The majority of the representations under this category are recognisable international figures such as Diana Princess of Wales (1961–1997), Queen Elizabeth II (1926–) and Mother Teresa (1910–1997). The only known female figures on postage stamps that are actually Cypriot come from two vastly different contexts. The first postage stamp was published in 1996 and is honouring a

lesser known Cypriot hero with the name 'Maria Sygklitiki', *Μαρία η Συγκλητική*. The second female portrayal on a postage stamp is this of visually impaired Paralympic winner Karolina Pelendritou (1986–).

The fourth category documented concentrates on images deriving from the traditional-folklore Cyprus culture and is represented with 8.9%. Many of those postage stamps are dedicated to the regional costumes that can be found across the island.

The subsequent category *Spouse and/or parenthood* features 5.1% of the corpus. It depicts women participating in aspects of the institution of traditional family such as marriage and parenthood with the necessity of the presence of a male figure. However, a group of these stamps show the female as a mother figure bonding with a child without the presence of a male counterpart.

The next two categories *Professions* and *Social Themes* both rank 3.8% each. The first group depicts a number of professions, some of them linked with tradition, such as the profession of the needlewomen (traditional Cyprus embroidery) and farmers, as well as nurses shown in two cases tending exclusively on male children. The social themes category is further divided in the stamps that present the issues of providing care for the elderly and AIDS campaigns for the alert and its treatment. The other four remaining postage stamps are solely focused on the image of the woman going through the experience of being a refugee. These depictions are related with the 1974 Turkish invasion and the displacement of hundreds of Cypriots.

The group *Women in Sports* features 2.5% of the corpus and celebrates the female participation in major athletic events such as the Olympic Games of Los Angeles (1984), Atlanta (1996) and Sydney (2000). It is important to note that, the Republic of Cyprus issued postage stamps for all the other Olympiads since 1960 as well as Commonwealth Games, but female figures were not presented.

The *Allegory* thematic group with the total amount of 1.9% contains representations that show women having allegorical and metaphorical meanings or being the symbols of a broader idea or notion. The first subcategory consisting of two postage stamps (1.3%) uses the female figure in order to allegorically portray the idea of freedom and fight for liberation.

The second subcategory contains only one postage stamp (0.6%) and is entitled *Woman as a Symbol of Beauty*. It illustrates an abstract female figure wearing a crown and was issued for the event of Miss Universe contest (2000) which was held in Nicosia, Cyprus.

The *Historical Events* group consists of two stamps only, (1.3%). The first postage stamp is focused on an engraving entitled *The Confession* first published in the British newspaper *Illustrated London News* in 1878. During that period Cyprus was becoming part of United Kingdom's protectorate after the Ottoman Empire has agreed to give away the island in exchange for military support. The particular illustration was part of a bigger collection published by the newspaper and was supposedly depicting the day of the regime's change in a pseudo – documentary way. The second stamp commemorates the 40th anniversary of EOKA's (an organization that fought for the self-determination of the island) formation.

The education category on the other hand, although consisting of one stamp only (0.6%) shows more interest in terms of postage stamp design and consequently the female representation as it seems to reflect other relevant studies.

The last category is entitled *Other* and features 3.8% of the entire corpus. It is composed of postage stamps that could not be easily assigned in a specific category by either of the two coders.

5. A semiotic look on selected stamps

During the content analysis the researchers came upon some interesting findings concerning the biggest thematic category of Cyprus postage stamps. The group that deals with depictions

deriving from Greek Orthodox Christianity's repertoire counts 64 stamps, the majority of which represent the Virgin Mary (59 postage stamps). The rather large amount of stamps is significant as it shows a preference for dominantly religious thematic groups. This fact seems to illuminate the high position that religion and the Church hold in Cypriot society. Interestingly enough the portrayals of Madonna seem to have a direct influence on the separate groups that depict women as mother figures and refugees.

The image of Virgin Mary seems to have the maternal dimension of her personality as the dominant quality, making her accessible to the pilgrim not unlike an ordinary woman who understands humanity's anguish. According to the study conducted by Ioli Kalavrezou (1990) on Virgin Mary's status in religion, her role as 'Holy Vessel', *Θεοτόκος*, shifted to accommodate the image of a Mother for all the believers, thus changing her title to 'Mother of God', *Μήτηρ Θεού*, during the period of Iconoclasm (8th century). This introduction of Mary as a now accessible, understanding and sentimental motherly figure was slow and is reflected on the distinctive iconography of each period. The role of Virgin Mary as a strong mother figure is additionally indicated by the Gospels (PG 100, col. 1476D), where Jesus Christ while addressing Saint John exclaims: "Here is your Mother", and then towards Virgin Mary "Woman, here is your son". Christ himself goes on to explain the above statement: "Be for them what all that mothers are naturally for their children" (Kalavrezou 1990).

In the subsequent section, the authors will attempt to showcase the influence that the major thematic group of religious representations and specifically the ones highlighting Virgin Mary's role as a mother figure have on other stamp categories. In particular, the authors have chosen to demonstrate this relation by presenting two postage stamps from two different categories.

The first example (figure 1) is a postage stamp designed by A. Tassos and issued on the 28th of April 1975, almost a year after the Turkish invasion and features a work by the Cypriot painter George Paul Georgiou. Starting from the title of the image *Virgin and Child from Liopetri*, sometimes referred to as *Virgin Mary from Liopetri* we can spot connotations with both the figure of Madonna and the notion of been a refugee, as Liopetri is a village situated in the geographical district of Famagusta, thus certainly been affected by both the invasion and occupation. On a first level of analysis we can easily note how the pose prepares the reader to perceive the connotations of a signified (Barthes 1983). The way the woman is holding the child has clear connotations with the idea of motherhood and could be linked to the caring and loving way Virgin Mary herself is holding Baby Jesus. The woman is almost attaching the child to her body in a protective manner and their heads are tenderly touching as in gentle embrace.

Fig. 1: *Virgin and Child from Liopetri*, 28 April 1975, A. Tassos.

On a deeper level of analysis we can notice the meaning constructed by colours and the values they help to create (Barthes 1988). Nevertheless, we should always have in mind how

colours tend to create a multitude of codes, depending on the societies and cultures they are used by. There definitely are broader trends and tendencies with the aid of which psychologists and other researchers attempt to construct a single and universal “language of colours”, but there are still colour associations with limited contexts (Leeuwen 2011).

Starting from the main figure, which is the mother or according to the title of the postage stamp *the Virgin*, we can notice that she is having her hair covered with a black scarf. This sign has clear connotations of death, in this context the demise of a close family member, most probably a husband (Pastoureau 2008). Additionally, the rest of the woman’s clothing points to a poor and socially low background. More specifically, she is wearing the traditional rubber boots usually worn by land workers and farmers. The child she carries is simply wearing a white shirt alluding to the values of colour white, such as innocence and pureness of soul (Beasley and Danesi 2002).

Next to the group of figures which seems to be almost compressed by their own frame, a candleholder is standing. On the level of iconology which takes into account the cultural and historical context of the image (Panofsky 1939), this item is rather significant as it is a part of the Divine Liturgy process of the Greek Orthodox religion and it alludes once more to the spiritual nature of the woman/Virgin. The main colours of the depiction are a combination of burgundy and gold, related to religious imagery, while the background is a deep hue of purple usually signalling emotional devastation and mourning (Gage 1999).

Fig. 2: *Mother and Child on the way of becoming refugees*,
7 October 1991, A. A. Ioannidis.

The second example presented (figure 2) is a postage stamp designed by A. A. Ioannidis, issued on the 7th of October 1991 on the occasion of the 40th Anniversary of the United Nations High Commissioner for Refugees. The engraving featured on the stamp is in black and white, a colour combination that tends to be associated with notions such as mourning and loss (Gage 1999). The postage stamp is entitled *Mother and Child on their way of becoming refugees*. This title is intersemiotically translated (Jakobson 1959) by placing in the middle of the picture a group of tents, used as temporary housing in emergency situations, more specifically a war in our case – 1974. Furthermore, the framework is deliberately narrowed down in order to be associated only with the refugees of Cyprus stopping the production of any other associations. This is achieved by placing the outline of the island’s shape next to the woman’s figure making it clear to the viewer that we are discussing the Cypriot refugees. This type of depictions could be associated with the second biggest trauma of 1974, a trauma that is gender-specific and relates to the inability of women to accomplish their role as caretakers. As Cockburn (2004) asserts during that period the mother was considered the primary caretaker of the children due to the fact that men were forced into military recruitment, having as a consequence for the mother to be experiencing the anxiety of keeping the children safe as her main responsibility.

By showcasing the visual examples deriving from the categories *Motherhood* and *Refugee*, the researchers attempted to demonstrate the link between those categories with the largest thematic group of the corpus that is *Religion*. Furthermore, going to a more spiritual level it seems that in some cases the female figure serves as a metaphorical vehicle for the mother's pain while employing forms and even phrases that allude to Virgin Mary and her own loss of a child.

6. Discussion

The researchers have been able to draw some general observations regarding the nature of the postage stamp as a modest or low key cultural memorial, especially, in the field of female representation in the Cyprus context. The images represented on the postage stamps are proving to be individually ephemeral but simultaneously substantial reflections of the society that produced them (Deans and Dobson 2005). One of the major reasons for conducting this research in the first place proved to be a big obstacle in the end, and this has been the lack of significant literature. However as mentioned before, our findings were able to be linked with the results given by the few relevant literacies concerning Cyprus.

According to other researches the Cypriot female tends to have a secondary role in contrast with the Cypriot male within the family institution, as well as the society and this is reflected by the small corpus the researchers were able to gather. She is associated with strongly emotional values (Milona et al. 1982). According to sociologists Lia Milona's research (1982) the female Cypriot believes that motherhood is her main goal in life and her biggest achievement. The 80% of the participants – all of them female – answered that having a child reinforces their status within the family and society, as they complete their natural role and destiny. Furthermore, the 44% of the participating women consider the birth and catering of the children as the biggest happiness of their lives.

As documented in international literature women tend to feel quite closer with their respected religion in comparison to male believers. This might be caused by the man's traditional role as the one who is a more active citizen and far more controlled by social laws. The traditional female tends to be regarded as the member of the family who is regulated much more by laws and norms deriving from the ethos of her religion (Hamilton 1978). As Milona (1982) asserts the female's role in patriarchal communities is tied with the domestic environment and this brings her closer to the spiritual realm of the religion. The 82% of the participants – female Cypriots – tends to believe that they are very religious, feel extremely close to God, and the institution of Church. As the postage stamp is considered a product of the official state and according to some researchers also a part of popular culture (Child 2005, 2012) definitely reflects social attitudes towards women within the Cyprus contexts. In this sense the subtle messages that postage stamps convey might potentially impact users/members of a society and their understanding of the type of male/female roles that are being sent (Ogletree, Roberts, and Merritt 1994).

Additionally, the results might be hints to uncover aspects concerning the social status of both sexes in the Cyprus context and the ideologies behind them. The female figure seems to be a large part of the postage stamps' representations in Cyprus holding important and key roles as a symbol of motherhood. However, the corpus following fifty three years (1960–2013) does not document and honour significantly any fights or accomplishments of the female gender. What is more not even known Cypriot women who excel in their respected fields are commemorated.

INTERPRETANTS AND THIRDNESS IN THE WORLD OF THE QUANTA

Baranna Baker
Independent Researcher, USA
(barannabaker@gmail.com)

Abstract

Werner Heisenberg, Niels Bohr and Charles Saunders Peirce: What do these men, separated by both a continent and time, all have in common? Fundamentally, the ability to see universal concepts in completely novel ways. All were revolutionary thinkers with the ability to strike to the core of the fundamental elements of what makes up existence. The common thread between all three: the universal – pure being, what the Latins referred to as *esse*. Being is the essence of life itself. Yet when we get down to the most basic, sub-atomic level of being itself, we arrive at the ultimate paradox of existence: that between how things seem to be and how they truly are. Peirce died in 1914, at the very advent of quantum physics. Bohr was just out of college then at 29, and Heisenberg was only 13. Peirce left the world his theory of signs, just as Bohr was beginning to explore the world of the atom, and Heisenberg was taking his first basic science classes. Heisenberg later befriended Bohr, but neither man met Peirce, and their revolutionary discoveries about the quantum world were published years after Peirce discovered that existence consists of the triadic action of signs. Yet Peirce's concepts of the interpretant and Thirdness mesh strangely well with Bohr and Heisenberg's Copenhagen Interpretation of the discoveries of quantum physics, with its emphasis on the role of the observer. For what Bohr and Heisenberg discovered about the basic fundamentals of nature seems to validate Peirce's belief that, no matter how closely one looked at the world, no matter how strong a microscope one put it under, what one would find would be the action of signs. It is indeed by this action that the world moves from chaotic randomness to concrete wholeness. The ultimate paradox of being itself is therefore found in the triadic action of signs.

[...]the basic changes in modern science must yet be considered as expressions of changes in our very existence and thus as affecting every realm of life. If this be the case, even those who try to fathom the essence of nature creatively or philosophically must take notice of the changes in the scientist's idea of nature that have taken place during the last two decades.

Werner Heisenberg ([1958] 1970)

[...]we meet in experimental evidence concerning atomic particles with regularities of a novel type, incompatible with deterministic analysis. These quantal laws determine the peculiar stability and reactions of atomic systems, and are thus ultimately responsible for the properties of matter on which our means of observation depends.

Niels Bohr ([1963] 1987)

[...]the highest grade of reality is only reached by signs[...]

Charles Sanders Peirce to Lady Victoria Welby ([1904, Oct. 12] 1977)

Werner Heisenberg, Niels Bohr and Charles Saunders Peirce: What do these men, separated by both a continent and time, all have in common? Fundamentally, the ability to see universal concepts in completely novel ways, blending philosophy and mathematics with scientific and creative inquiry in ways never dreamt of before. All were revolutionary thinkers with the ability to strike to the core of the paradox of what makes up existence. The common thread between all three: the universal, pure being, what the Latins referred to as *esse*. They all played on their skiff of musement, as Peirce would say, searching for the keys to the universe, and all, in their own way, finding them. Peirce died in 1914, at the very advent of quantum physics. Bohr was just out of college then at 29, and Heisenberg was only 13. Peirce left the world his theory of signs, just as Bohr was beginning to explore the world of the atom, and Heisenberg was taking his first basic science classes. Heisenberg later befriended Bohr, but neither man met Peirce, and their revolutionary discoveries about the quantum world were published years after Peirce discovered that the world consists of the triadic action of signs. Yet Peirce's concepts of the interpretant and thirdness mesh strangely well with the paradox of Bohr and Heisenberg's atomic theory, with its emphasis on the role of the observer. For the paradox that Bohr and Heisenberg found at the root of all existence seems to validate Peirce's belief that, no matter how closely one looked at the world, no matter how strong a microscope one put it under, what one would find would be the action of signs.

In order to understand how Peirce's semiotics fits into Bohr and Heisenberg's world of the quanta, we must discover first what that world consists of. The atom is made up of a proton, a neutron and multiple electrons swirling around the former two in a chaotic pattern of randomness. (Atomic particles much smaller than these have since been discovered; most exhibit the same, strange, erratic behavior as the randomly orbiting electron.) What Bohr and Heisenberg simultaneously discovered (while on a forced vacation from one another) was that there was one thing that seemed to stop the elusive electron in its tracks: observation (or as Bohr put it, the measuring apparatus). This was the only explanation for the quantum weirdness exhibited by the electron when tests were performed on it. What the two formulated on their separate retreats was what came to be known as The Copenhagen Interpretation. It incorporated Bohr's Principle of Complementarity with Heisenberg's Uncertainty Principle and came to the conclusion that

the world, at its smallest level, was statistical and uncertain, not objective in the way Newtonian mechanics had claimed for centuries. The objective world we experience simply does not exist at the most basic levels of existence. The building blocks for the world we experience as concrete are as effervescing as air. This idea was puzzling, to say the least, even to the two men involved. Heisenberg quotes Bohr as saying, "If you think you understand quantum mechanics, you have not understood quantum mechanics." (1970)

In addition, The Copenhagen Interpretation claimed that to refer to the idea of the physicality of atomic matter at all is an oxymoron. Atoms, the building blocks of the world, have nothing that corresponds with the idea of matter. And yet they are the basis of every substance we see, including ourselves. The realization Bohr and Heisenberg both came to was that the Newtonian world of material things does not exist at all until someone looks for it. The world we live in is observer-created. Heisenberg puts it succinctly, in *The Physicist's Concept of Nature*, when he says:

It has become clear that the desired objective reality of the elementary particles is too crude an oversimplification of what really happens, and that it must give way to very much more abstract conceptions. For if we wish to form a picture of the nature of these elementary particles, we can no longer ignore the physical processes through which we obtain our knowledge of them. (1970)

Bohr, in his philosophical writings puts it thus: "Far from involving any special intricacy, the irreversible amplification effects on which the recording of the presence of atomic objects rests rather remind us of the essential irreversibility inherent in the very concept of observation." (1987) But how on earth could this paradox possibly be? What proof led these two brilliant men to come to this startling conclusion at the same time, separated by miles of distance?

Heisenberg and Bohr's ideas were their responses to a little quantum experiment known as the double-slit experiment, which illustrated that electrons appear as waves of probability when not observed, but show up as particles when someone looks for them. The experiment is set-up thus: On one side of a barrier wall with two perpendicular slits in it is a hot tungsten filament that shoots out electrons. On the other is a television screen that records any electron that comes in contact with it. With one slit closed, electrons are projected at the wall, and those that get through the hole are recorded as dots on the screen. One after another, the electrons are propelled through the hole, and each time they appear as particles. However, open both slits and something strange happens. Instead of recording a series of dots left by individual electrons, an *interference* pattern appears, as would appear when two ocean waves overlap while hitting a wall. Instead of individual particles hitting the screen resembling the pattern that little bullets fired through the hole by a machine gun would show, a target pattern is found, such as one would see should one direct a wave of water at a wall. But these are not waves of matter the screen is detecting, but waves of probability that the electron will show up at any given place on the screen. And it is not that the little particles of electrons are moving through the barriers, one-by-one, like they are surfers riding a wave. Each electron actually spreads out in a wave-like fashion and goes through both holes at once. Talk about a paradox, indeed!

If reality is objective, as Newtonian mechanics suggested, then this experiment makes no logical sense. Once a particle, always a particle. The same machine gun-like pattern should be seen whether we open slit one, open slit two or open them both at once. But this is not what happens. However, when we set-up a detection mechanism at the other side of the two open holes

to see which one the electron is going through, what we see is one electron after the other going through either hole one or hole two. Basically, when we are looking to see what happens, the particle acts like a particle, when we turn off the detecting mechanism, the particle turns into a wave. Now you see it; now you do not! This is quantum weirdness, the ultimate paradox, at its best. Look for a particle, you see a particle; turn your gaze away, and the particle turns into a wave. The electron is both particle and wave at the same time. This kills any idea of an objective world, making it literally impossible for us to visualize what is happening on the atomic level. The final paradox of reality is that we can never see reality in its primal state.

Here, Peirce's idea of the *interpretant* suddenly becomes fundamental in order for the world to exist for us at all. The interpretant is what Peirce calls the mental connection that exists between a sign and its observer. Peirce sees this act of consciousness as an idea of something, which links the two together, but what if the meaning of interpretant is expanded to encompass the idea of the mere observation of something, before conscious thought occurs at all? Then particles become particles, when we engage the interpretant and look for them. Omit the interpretant, and particles turn into waves. Peirce's triadic action of signs then becomes an explanation for how the world exists for us as we experience it: solid, objective, Newtonian to the core. As Peirce, paraphrasing Kant, says, "All cognition of objects is relative that is we know things only in their relations to us." ([1868] 1991) We only know of objects via the action of the interpretant (an observation), which connects sign-vehicle (the waves of quantum particles) to the sign (the object we see), making it cognitive to us. It explains what Heisenberg means when he states:

We can no longer speak of the behavior of the particle independently of the process of observation. As a final consequence, the natural laws formulated mathematically in quantum theory no longer deal with the elementary particles themselves but with our knowledge of them. Nor is it any longer possible to ask whether or not these particles exist in space and time objectively, since the only process we can refer to as taking place are those that represent the interplay of particles with some other physical system. (1970)

The interpretant, in the form of an observation, is therefore central to our apprehension of the world. It is what allows us to visualize things objectively. To walk around touching tabletops, and marbles and other hard surfaces, which are actually made of nothing but probability waves composed mainly of empty space. Peirce describes the interpretant as the "appeal of a sign to the mind", saying thus:

Let us now see what the appeal of a sign to the mind amounts to. It produces a certain idea in the mind, which is the idea that it is a sign of the thing it signifies and an idea is itself a sign, for an idea is an object and it represents an object. The idea itself has its material quality, which is the feeling that there is in thinking. (1991)

We look for something, the interpretant engages it, and there it is. Only Peirce's triadic set-up of sign, sign-vehicle and interpretant makes this idea even slightly comprehensible. Peirce goes on to say, "Thus our mere sensations are only the material quality of our ideas considered as signs. Our ideas have also a causal connection with the things that they represent without which there would be no real knowledge." (1991)

The paradox here is that, without the interpretant, the material world, as we know it does not exist at all.

Another of Peirce's concepts further aids us in better understanding the world at the atomic level. Here the link is what Peirce called *thirdness*. Peirce explains it in the following manner:

I should define Firstness, Secondness and Thirdness thus: Firstness is the mode of being of that which is such as it is, positively and without reference to anything else. Secondness is the mode of being of that which is such as it is, with respect to a second but regardless of any third. Thirdness is the mode of being of that which is such as it is, in bringing a second and third into relation to each other. (1991)

In the case at hand, *firstness* is the world at the atomic level. *Secondness* is the objective world as we experience it and *thirdness* is our observation of it, which transforms the First into the Second.

The idea of firstness being life at the atomic level meshes well with Peirce's thoughts on the matter. He says

The unanalyzed total impression made by any manifold not thought of as actual fact, but simply as a quality, as simple positive possibility of appearance is an idea of Firstness. Note the *naïveté* of Firstness.[...]The idea of the present instant, which, whether it exists or not, is naturally thought as a point in time in which no thought can take place or any detail be separated, is an idea of Firstness. (1991)

Note how the words *positive possibility* parallel nicely with the *potential* or *probability* so predominant in the laws of quantum physics. Firstness is the state the world is in when it is totally unanalyzed – i.e. unobserved. The quantum world is truly the manifold of all existence, yet in many ways, it is no more than a quality. It is no more than an appearance on a television screen of an interference pattern that suggests what electrons do when unobserved. There is a certain *naïveté* involved on the electrons' part. They only seem aware of being particles when we stop and take a look at them. They do exist in the present instant, that moment before we consciously look for them. And the quantum world is indeed interconnected without any appearance of separation; the most minute particles known to us will sometimes split due to a crash collision amongst two electrons, sending one half of the particle clear across the globe. Yet the now separated particles still continue to affect one another. The ultimate state of firstness, it would appear, is found at the atomic level.

The atomic world fits so well into the world of signs, it is startling. Peirce describes the First thus:

The First must be therefore present and immediate, so as not to be second to a representation...It must be initiative, original, spontaneous, and free...It precedes all synthesis and all differentiation: it has no unity and no parts. It cannot be articulately thought: assert it, and it has already lost its characteristic innocence...Stop to think of it, and it has flown. (1991)

The quantum world is everywhere, all the time. It permeates all we are and do. It has always existed since time began. It was here at the birth of the universe and will continue until its death. Everything we interact with and are surrounded by is composed of it, including ourselves. It is second to none. It is literally the source all the triadic relations that make up our world spring from. It is spontaneous to the extreme, with its freely moving particles of probability waves. It is the initiative, the very beginning act, necessary in order that anything else exist. It is firstness incarnate, preceding all other form of existence. It cannot be differentiated, yet it has no unity. It is primeval, indivisible. It has no parts; there is no matter in what makes up what we see as matter. The paradox of life at its most basic level, the level of firstness, is that matter does not exist.

Secondness is the world as we experience it. It is the semiotically subjective element of our world that makes up what we term *objects*. It is in the moment after firstness that the world loses its quantum character. The objective world we experience every moment of our lives is what meshes with Peirce's category of secondness. It does take effort to become conscious of the world. It is necessary that we observe it before it becomes our reality. Remember the paradox of quantum weirdness: if we do not look for a particle, it does not exist. True it is usually an unconscious effort, but we are all at times aware of more intense observation and the effort it takes. A day trip to the local museum to stare intently at the artwork there, in order to get at its meaning, is all that is needed to show that. It takes so much effort to observe something intently that museums now have cafeterias on their premises, so you can replenish all the energy it has taken. The effort we exert while unconsciously changing the structure of *esse* – 'being' – every second of our existence does not leave us running for food. In fact we do not notice it at all until we stop and focus on what we are doing. There is no hidden purpose or agenda behind it. It is completely prescinded from any such thought. It is too instantaneous for that to happen. Most of the time the objective world rolls out at our glance, with no thought of purpose on our part at all.

"Thirdness is the triadic relation existing between a sign, its object, and the interpreting thought, itself a sign, considered as constituting the mode of being a sign. A sign mediates between the interpretant sign and its object," (1977) Peirce explains in his correspondence to Lady Victoria Welby. In the model we have been looking at, the quantum world is the object, which gives us the raw material, through our unconscious observation in the form of the interpretant. This enables us to view the world of signs that surrounds us, which we experience as an objective, deterministic world. Existence (for each of us a highly individual experience) is truly the mode of being that allows us to view the world objectively. It is truly *our* world, and it consists of the action of signs. As Peirce puts it, "...all our thought and knowledge is by signs." (1991) Peirce further notes "If you take an ordinary triadic relation, you will always find a *mental* element in it. Brute action is Secondness, any mentality involves Thirdness." (1991) Thirdness is the glue that links our reality together. In other words, it is the mental element that in truth creates this world out of seething foam of random probabilities. The quantum world becomes our objective world through the thirdness – the mentality – of our experience in it.

"First and Second...are categories which enable us roughly to describe the facts of experience...The Third is that which bridges over the chasm between the absolute first and last, and brings them into relationship." (1991) What brings the atomic world and our objective world into relationship is observation. If we are observing it (and we always are when not asleep), the gap between the two worlds is bridged by our conscious gaze. Look for the world, and you will find it. Observe it, and there it is. The Third is the element of relationship that our gaze gives. In an observer-created world, the conscious gaze is as certain as the relationship that changes the atomic world into the world we experience as solid matter.

Science has now shown us that our experience of the universe is only half of the picture, a paradox frightening for many, intriguing for other. Still, when visualized as consisting of a triad

of Firsts, Seconds and Thirds - signs, sign vehicles and interpretants - our interactions with the atomic world, and how those relationships create the very things we are interacting with, seem, perhaps, a little less mysterious, a little bit less of a paradox. The quantum world might be forever outside the limits of our perception, but we have none-the-less discovered it. And in the end, life consists of actions; observation simply provides the setting for all the action to take place in. "All the world is a stage," ([1599] 1974) Shakespeare said, and all the world consists of action: the triadic action of signs.

SIGNS OF SPACE IN ARTISTIC, SCIENTIFIC AND CHILDREN'S DRAWINGS: DIFFERENCES AND SIMILARITIES

Eirini Papadaki
Lecturer, Technological Educational
Institute of Epirus, Arta, Greece
papadaki@teiep.gr

Abstract

While drawing, children, as well as artists and scientists are energetically searching, choosing, simplifying, abstracting, analyzing, composing, completing, correcting, comparing, demarcating. All these processes form the way that the human brain elaborates cognitive material in every level. Children's and adults' drawings can be seen as critical tools and discovery processes, valuable perception aids, visual thinking mechanisms and routes to knowledge (Papadaki 2013). Both children and adults use the same resources (lines, shapes, orientation etc.) in order to realize meaning. These semiotic acts "should be seen as part of an intertextual chain... as stages in an ongoing dialogic process" (Van Leeuwen 1998:275). Artists, scientists and children alike construct knowledge as they deploy meaning across different modes and combine them in image ensembles (Kress 2003:141).

This paper provides the framework of a larger research which is still in development and tries to interpret children's understanding of space by examining children's drawings of spaces having in mind artistic and scientific spatial drawings. The research focuses on drawings made by children between 4 and 12 years old (kindergarten and elementary school).

1. Space in art drawings

Space is a major, as well as a complex concern in art and it has been so throughout the history of art. Some artists, such as Frank Stella, see the creation of space as the principal goal of art. From Renaissance art that tried to depict three-dimensional space using perspective to 19th century art of Turner and the Impressionists and further on to 20th century experiments of

spatial and space-time representations much has changed. Art has never stopped investigating the concept of space. Abstract explorations of space are nowadays common. Space is implied through the examination of surface, texture and color. Conceptual ideas about space are implied through optical impressions.

2. Space in science drawings

a. Mathematics, physics

Dictionaries define mathematical space as a set of elements or points satisfying specified geometric postulates or the infinite extension of the three-dimensional region in which all matter exists.

In scientific drawings a topological statement or drawing determines a spatial relationship, like something that is included in something else. Geometry is the study of spatial forms. It involves representation of shape, size, pattern, position and movement of objects in the three-dimensional world, or in the mind of the learner. It investigates three-dimensional objects and two-dimensional shapes as well as the concepts of position, location and movement.

b. Architecture

A challenge in terms of representation, architecture relies on drawings. The form of the three-dimensional building appears as lines on the two-dimensional paper. Form encloses space and by doing so gives space its shape (Spankie 2009:12). For Adolf Loos, the creation of space should be driven primarily by the effect that the designer wishes to exert upon the spectator. Through drawing, the architect externalizes initial thoughts in sketch form, tests ideas, evaluates solutions and solves problems before they occur. He/she speculates on alternatives. The architect uses drawing as a critical tool (Haralambidou 2007:234) or a set of instructions. He/she accepts standard representational conventions, the language of drawing, in order to firstly observe and record and secondly as a way of “thinking aloud”. For architecture, drawing generates space.

3. Children’s drawings of space

How space is perceived in the children minds is a much studied subject in developmental psychology. A child’s drawing of three-dimensional space on a two-dimensional piece of paper is a puzzling achievement. Drawing appears to be a useful tool in fostering mental model building with respect to the representation of spatial relations (Leopold & Leutner 2012:9). The process of drawing makes topological relations among components explicit and therefore helps the learner to identify relations among the components of a displayed object (Larkin and Simon 1987).

We live in a three-dimensional world and should, therefore, be able to understand and depict depth, continuity, surrounding, order, enclosure, scale. Drawing helps children “represent features and relations structurally analogous to those of the reference objects” (Leopold & Leutner 2012:2).

The drawings for this research are made by children aged 4-12. There are different phases in the development of sign processes in children, as the sign system evolves during the process of aging (Sebeok 1977). Based on Piaget’s theory on mental development in children, Krampen (1991) speaks about “developmental semiotics”. A child begins to produce meaning by indexical signs based on present objects (perception and perceptual activity). At this stage, children start drawing simple schemes—the lowest level of semiotic structure or mere foregrounding of a sign (Krampen 1991). As they grow older, they go on to producing meaning by symbols (imagination). They now draw more complex functional schemes—second level of semiotic structure or syntactic information (Krampen 1991). Finally, through high degree of abstraction, the child

comes to produce meaning using signs. The third level of semiotics entails context. For Peirce (1965:143) the relevant phases are named iconic, indexical and symbolic, while Bruner (1966) talks about the enactive, the iconic and the symbolic phase. Luquet (1927) has proposed five stages in children's development: scribbling, fortuitous realism, failed realism, intellectual realism and visual realism. Children's drawings are considered a type of symbol appearing in the transition between symbolic play and imagination (Krampen 1991:22). Matthews (1984:1) suggests that "the child builds iconography on a substratum of symbolizations" at a very young age, before and during the "scribbling stage".

Figure 1: a car drawn by Christos at the age of 3

not see it as an external schema — the internal is equally important. In this drawing, the car, despite the fact that it is a very nice abstraction, has not taken the form of a symbol.

Figure 2, drawn at the age of 4, is a rational approach. It focuses on functional elements, like wheels, seat, steering wheel. The convertible schema helps him with his goal and the linear representation helps him grasp the meaning. The indication of the environment, a line, shows his try to perceive functionality.

Figure 2: a convertible car drawn by Christos at the age of 4

In figure 3, drawn at the age of 5, the relation of the car with the wider environment, like the sun, the sky, the clouds, the tree, the earth, characterizes the fact that he has at this point placed the car in its natural surroundings. However, the car still has a central position in the drawing and defines space. In the specific drawing, there is a strong element of subjectivity. The wheels, like two big blue eyes that look at the viewer implicate a tendency to shape a face. The body of the car is shaped in this image as a trapezoid. This is the schema that Christos chose and will use from this drawing instance on, in order to represent the car. In many instances it will tend to be reshaped more and more as a triangle, trying to represent dynamics, eg to depict racing cars. This is a route from the picturing of the experiential relation to the sign. The sign at this stage entails syntax.

Figure 3: a car drawn by Christos at the age of 5

Figure 4 shows different drawing instances of cars drawn by Christos at the age of 5,5. The numbers on the cars denote racing cars. The third drawing is the final drawing of a series of drawings concerned with car races. Christos considered it as the best and completed one, so he did not have to draw any other. When asked why this was the best one he answered that the biggest car in the drawing is the leader of the race (shaped almost as a triangle because it is the

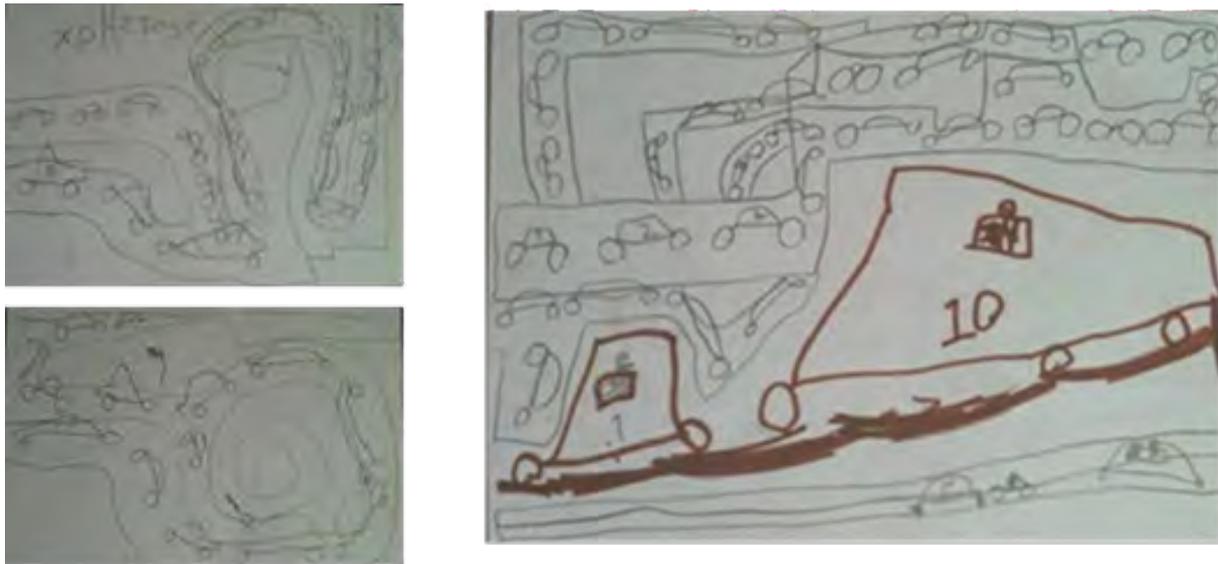

Figure 4: different drawing instances of racing cars drawn by Christos at the age of 5+

most dynamic and the faster one) and that Christos himself is standing near the finishing line and he is going to be the first who sees the winner. The biggest car is therefore the one that is closer to the spectator. In this drawing, Christos managed to give the illusion of space, using techniques such as placement on paper, size, color and detail. The closest car is colored with a darker, warm color, it is bigger than all the others and details such as the driver and the number on it are shown perfectly clear. The second car of the race still has these characteristics (except that it is smaller and less of a triangular shape), but all the others are not colored, small and the details are not visible. We, the spectators, cannot see them, as they are too far away. Christos has managed to show depth/space.

4. The research

About 1000 children from 12 schools in Greece were asked to draw four images of spaces: their room, their house, a map and a maze. The research took into account two important issues:

- the importance of the socio-cultural influences (see Alland 1983, Arnheim 1954, 1969, Golomb 1992, Goodnow 1977, Kellogg 1970) that shape children understanding and depiction of space, as well as their understanding of the value of drawing
- the importance of the curriculum in the children familiarization of the various drawing techniques

The sample for the research was chosen randomly but includes children both from big cities and from small villages, both in mainland Greece and in islands, in order to examine children from various Greek socio-cultural settings, following both the standard school curriculum and the enlarged zone curriculum, which includes drawing, PC learning, theatrical education, foreign language and music.

The children that took part at this research were between the ages 4-12. The reasons for the selection of this wide age-group were many: the examination of the developmental direction (both physical and mental growth) in spatial presentation of children drawings and the acquisition of specific techniques of spatial representation depending on age, school curriculum and socio-cultural influences, the possibility of following universal laws of drawing space (learned

from art and/or science) and leaving aside socio-cultural influences as children grow older.

For the purposes of this paper, as well as for the sake of economy, and as the research is still in development (in the process of gathering the children drawings from the island of Crete and mainland Epirus), I will focus on the presentation of three main issues that seem interesting about children's use of the semiotic system of drawing in order to present space: a) organization/arrangement of objects on the paper provided, b) depth (as an implication of space) and c) socio-cultural differences between the children living in a big city and the children living in a village. I will use as the sample of this small study the 400 drawings I have gathered up to this point. These drawings were made by children living in northern Greece, in the city of Thessaloniki and a village nearby called Koufalia.

5. The first findings

The notion of space implies a certain organization and arrangement of things. Agreeing with Golomb, there are two main compositional schemes in children drawing, which are noticeable in the sample gathered do far:

1. Alignment of items in a grid like fashion along both horizontal and vertical axes and
2. Centering strategies, which organize items around a pictorial center (Golomb 1992:166).

The youngest children of the sample drew with vivid colors and much enthusiasm the first two themes: their room and their house. There were many similarities in the drawings. The vast majority of the children (almost 80%) in the space provided for drawing their room drew a bed. The bed represented their room, as the main reason they stayed in their room was sleep. The bed was usually drawn as seen from a point above it (borrowing the Japanese bird-eye view technique). Young children use the biggest abstractions, the objects are thought of as being important in themselves, without any reference to their surroundings. The concept of space is not fully grasped at this stage.

Figure 5a, b and c: Drawings of children aged 4-5 (elementary school). Theme: my room

In some drawings there were other elements of the rooms visible in the picture. However, the bed was still the most important object of the room, either being at the center of the picture or vividly colored, enclosed in a space by itself, etc.

Figure 6a, b and c: Drawings of children aged 4-5 (elementary school). Theme: my room

Most of the children placed the objects of their drawings in horizontal and vertical axes (defined by the space on the paper provided for their drawings) and only a small minority organized the items around a pictorial center. There were no noticeable differences between the children living in the village and the children living in the big city, as far as the drawings of their rooms were concerned.

The case was similar with the drawings of the children’s houses. Almost all the children drew on a baseline (the one marking the bottom end of the provided space) the same square with the triangle on top which they have learned to decipher as the “home”. There were two interesting tendencies regarding the house drawings: a. many children drew their houses as transparent, using the X-ray technique, so that the spectator could peep into the house (figure 7c) and b. many children drew figures of their mother and father beside or in the house, trying to imply that their house is where their mother and father are (figure 7a and 7b). There is no sense of scale in the drawings: the human figures are almost the same size as the house. Some children living in Thessaloniki drew blocks of flats (figure 7d), while the children living in Koufalia drew only detached houses.

Figure 7a, b, c and d: Drawings of children aged 4-5. Theme: my house

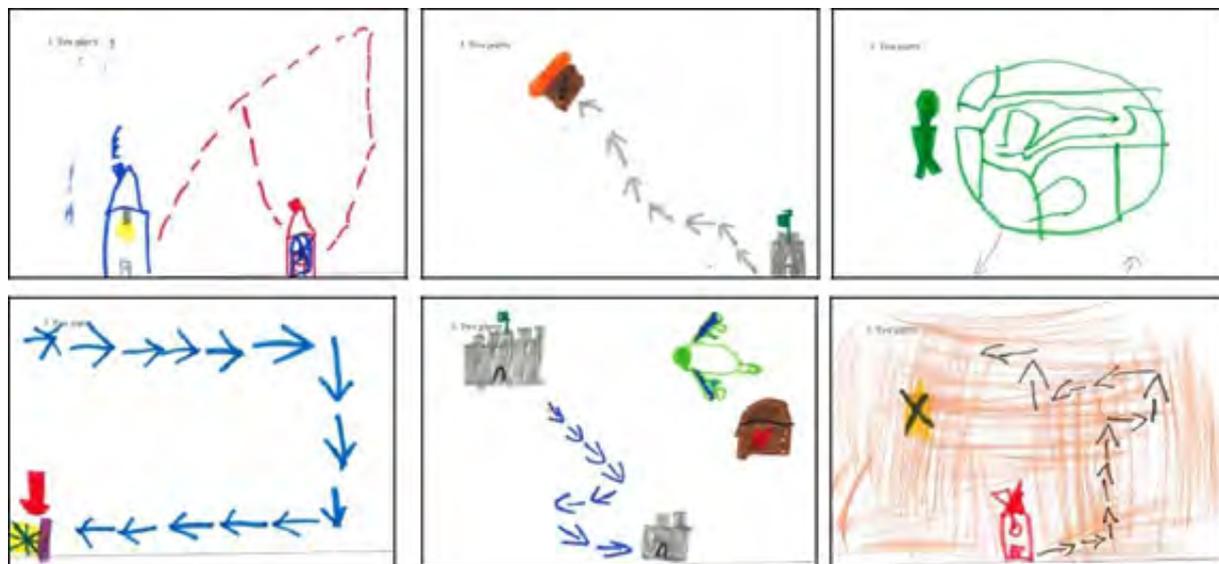

Figure 8a, b, c, d, e and f: Drawings of maps by children aged 4-5

Figure 9a, b and c: Drawings of mazes by children aged 4-5

Figures 8 and 9 show drawings of maps and mazes by children aged four to five years old (kindergarten). The drawings produced in order to represent maps and mazes by the four-to-five year olds seem to be influenced by images not directly associated to the children experience, but rather mediated to children through books and/or television. The images of maps seem like guidelines to go to a specific place. The similarities between the drawings prove that the task was faced collectively, rather than individually. The drawings were treated as a group project.

Figure 10a, b, c, d, e, f: Drawings by first grade pupils. Theme: my room

The drawings collected from the first grade are much different. The children drew their rooms following at a greater extent centering techniques (figures 10a, 10d and 10e). More furniture and personal items appear in the children's rooms (figures 10b, 10c, 10d and 10e). As the first grade marks the first year that children have school homework, the desk is the main furniture in the drawings of the children's rooms.

Regarding the drawings of the children's houses, distinguishing features of the houses are used in order to stress the uniqueness of each specific house (figures 11b and 11c). A furnished balcony and a dog nearby (figure 11c), a staircase in the house and a tractor outside (figure 11b) characterizes the place as unique, determines its identity. It is now recognizable by everyone as a specific child's family home. The underlying of the uniqueness of a house seemed especially important for the children living in the village. When asked where they live, children living in the big cities answered with a street name and a number. Children living in villages, however, gave a descriptive answer: "at the stone house at the end of the street", or "at the green house behind the white fence".

The first attempts to show depth—using the technique of perspective—are visible (see figures 10c, 10f and 11a): children draw the closest object in the room bigger (figure 10c) or on a different baseline at the bottom of the page (figures 10f and 11a).

Figures 11a, b and c: Drawings by first grade pupils. Theme: my house

As far as the drawings of maps and mazes are concerned, first grade pupils seem to be very much influenced by TV images, school books' exercises and electronic video games (figures 12a, b, c and d).

Figures 12a and b: Drawings of mazes by first grade pupils
Figures 12c and 13d: Drawings of maps by first grade pupils

The only difference of the drawings made by the second grade pupils that have been collected so far is that there is less color and that the vast majority of the mazes are drawn as strictly geometrical spaces.

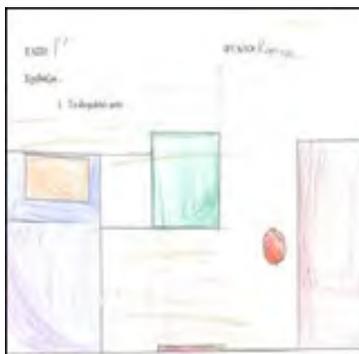

Figure 13: A drawing of a bedroom, using geometrical shapes, by a girl in the third grade

The pupils of the third grade were the first to produce geographical maps. It is easy to understand the reason why such maps are firstly drawn at this age, as in the Greek educational system the subject of Geography is introduced in the third grade. Other than that, it is interesting to point out that the majority of the images are drawn using only pencil, while almost all of them use the bird-eye view combined with the centering technique. Geometrical shapes are widely used.

From the fourth grade onwards the concept of space seems to be successfully perceived in the children's minds and implied in their drawings. Spatial depth (the notions of far and close) is visible. It would be interesting to find out whether children are taught of the concept of space or how to represent it in drawing in the school curriculum, but this is a theme for another research.

A very clear difference between the drawings made by the children living in the village and the children living in the big city was found to be the speed of spatial development. The easy

explanation for that seems to be the different, wider curriculum offered to the children in the schools of the big cities. The enlarged zone program of the city schools offers to the children subjects like music, foreign language, PC learning, theatrical education and art. These classes, including the art class are required classes for all the children of the school. In the schools of the village Koufalia, on the other hand, the typical school program, which do not offer the above mentioned classes, but is strictly oriented around the study of the semiotic systems of language and mathematics—does not encourage artistic ability. When asked their opinion about drawing, children living in the village said that —drawing is for small children—easy to understand why, as they stopped engaging with it as soon as they entered the first grade. On the contrary, children living in the big cities see drawing as a serious system of knowledge, like linguistics and mathematics. Consequently, the children living in the village were weak in capacity to draw space. Their lack of skill did not, however, mean lack of knowledge on the subject.

Figure 14: Starting to show depth and understand vertical and horizontal alignment, a drawing by a boy in the fourth grade

6. Discussion

In all the drawings that I have gathered so far, the perception and representation of space is firstly experiential. The description of space is inseparable from the child's experience in it. The drawings themed "my room" and "my house" describe the experience of the child's usage of specific objects; the narrative is first and foremost experiential. Of course, these drawings are descriptive right from the outset. In the drawings of maps and mazes, however, the majority of children seem detached from personal experience.

All the children have already done big deductions: they have decided on scales, proportions and sizes, what to put into the frame of the picture and what to leave unseen, they have represented the three-dimensional world into the two dimensions on a piece of paper. Between the ages of 4 and 7, most children do not understand the concepts of a map or a maze and try to conceive them using mediated images, seen in television, school books or elsewhere.

Following the drawings and agreeing with Piaget, "representational thought or imagination at first appears to ignore metric and perspective relationships, proportions, etc. Consequently, (the child) is forced to reconstruct space from the most primitive notions such as the topological relationships of proximity, separation, order, enclosure, etc., applying them to metric and projective figures yielded by perception" (Piaget 1976:4). The relationships termed "topological" by geometers are regarded as elementary from the standpoint of the theoretical reconstruction of space. After many drawing instances and attempts, the child comes to terms with basic metric relations. Children's drawings seem geometrically consistent after the age of 7: notice the ways the furniture of the rooms are positioned.

For Piaget (1956) drawing is the tool to represent spatial conception. It was the practice of drawing that geometry was founded on, as Piaget quotes his teacher and philosopher of mathematics Léon Brunschvicg. Through their drawings during the years, children continuously revisit and reconstruct previous topological knowledge stemmed from cognition. Both artists and scientists start from experience and sensory perception, but after long periods of research, they arrive at aesthetic perception—that means deduction, abstraction, removal from experience, from the personal, the particular, the one and moving on to the universal, the collective, the unarguable truth. At some time, children are able to conceptualize metric relations, like direction

Figure 15: Drawings by children in fifth and sixth grade.

(see the drawings of mazes) or distance. Wittmann writes that “according to Piaget, children have always had an implicit knowledge of what modern mathematicians could not conceptualize before the introduction of topology around 1900”.

Between the ages 7-12, children are able to apply projective geometry, symmetry (correspondence in size) and generally a clear and successful illusion of space in their drawings. If we

follow the history of art, we will see that the techniques used to create space were invented in the fifteenth century, after the Renaissance period. During the research, I was surprised to find out some similarities of the stages of children drawing with the pre-history of human image-making. It is as if the child follows the same historical route in a few years. According to Marcusen (2008), almost all primitive art and, historically, all pre-Greek art basically have the metric structure at which the child invariably arrives.

Many well-known modern artists highly valued the simplicity of forms, the abstract thinking and free spatial orientation in children drawing. In 1912 Kandinsky wrote that the child has the natural ability to absorb the thing as such (Fineberg 1997:46). Kandinsky, as well as artists like Klee and Feininger were collectors of children's drawings and they even used some of them as resources for their work. Kandinsky sought in children's art to reveal an abstract, universal language.

If we examine children's drawings with a Vygotskian lens like Brooks (2009) does, we will find that drawing can function as a mediator between a child's spontaneous and scientific concept. For Vygotsky (1987) spontaneous concepts derive from direct encounter with things, experience, memory and increasing generalizations. See, for instance, through figures 1-4, how Christos started with drawing his family's car and continued experimenting until he formed a satisfying for him sign for cars and then for racing cars. This procedure involved high mental functions, as Christos had to find the structural elements of cars, he had to make reductions, abstractions from the thing known through experience (the family's car) and then make groupings and generalizations in order to imply through one drawing the notion of the whole kind (cars and specifically racing cars). His drawings imprinted his thinking route. Through his continuous drawings, he experimented on the notion of cars, from the specific to the general, and learned more things about the essence of cars. His newly acquired knowledge was communicated, again through his drawings to other people (his family, his classmates).

The same experience-memory-thinking-abstraction-grouping-generalization scheme is visible in the drawings of the children of the sample studied, as they grow from 4 to 12 years old. At young ages, they defined their room with its more functional element—a bed, for sleeping, or a desk, for studying. They went on to include in the drawing many personal things, what stemmed from their experience with the room—they placed the objects in their surroundings and examined relations, distances, orientation of objects as such and in relation with each other. This examination became crucial for their understanding of space and spatial representation. The older children removed the objects from the burden of personal associations (figure 15). This study from the thing as such to the thing as related to its surroundings and other things and then to the generalized thing requires high mental functions and is the exact procedure scientists and artists follow, as shown in previous research (Papadaki 2013).

Scientific concepts, on the other hand, as Vygotsky (1987) puts it, need the following of the opposite path: the drawing subject does not now go from the thing to the concept, but rather from the concept to the thing. In order to test this route, we asked children to draw maps and mazes, which, obviously, they had no experience with. Younger children were much influenced by mediated experience and tried to bring the concept closer to known things, e.g. maps of treasures, as seen in toys, books or television, maps as directions to go to specific places, as seen in children's party invitations. The first drawings of mazes were exact copies of images seen somewhere, even if they were not exactly mazes—far from it. The last drawing attempts, however, as shown in figure 16, included a big percentage of architectural mazes and many geometrical influences. Going from the concept to the thing is a much more difficult task. For children living in big cities that have the chance to follow art classes in school, this process takes place faster and easier. It was puzzling to see perfect architectural mazes and geometrical shapes

made from students of the second grade and third grade. These students were not yet or were hardly introduced to Geometry.

All children should be able to acquire competence in such a valuable tool for their cognitive development. As a meta-cognitive, deliberate, meaning-making activity, a perfect semiotic system that could be the base of a kandiskian universal language, children drawing involves high mental functions, entails discovering the essence of things and concepts and uncovers, in the same way as art and science do, important information about the world. Children's drawing communicate the visible, but unseen.

INTERPRETING PICTURES: A SYSTEMIC-FUNCTIONAL SEMIOTIC MODEL FOR VISUAL IMAGERY

Howard Riley
University of Wales Trinity Saint David,
Swansea, UK
howard.riley@sm.uwtsd.ac.uk

Abstract

Semiotics is a powerful tool of interpretation, able to facilitate the negotiation of multiple meanings from visual works. This article introduces the provenance of systemic-functional semiotic theory, and contextualizes its application in the domain of illustration. Demonstrating the flexibility of a visual semiotics through the compilation of a chart formulated for decoding visual (rather than linguistic) modes of communication, the article examines divergent interpretations through an analysis of selected illustrative practice. Alternative interpretations and insights are shown to be negotiable as a result of a series of choices made by both artist and viewer. Semiotics reveals how images generally deemed to be straightforward and natural within their conventional discourse are actually cultural constructions, the result of social and historically formed positionings.

1. “Look! The Sun obeys my syntax”

Velimir Khlebnikov’s (1913) wry observation about how our languages structure our realities is an apt introduction to an article which explores how a semiotics of language may be adapted to analyse and explain how visual work may also structure our experiences of the world in a shareable form.

Semiotics, the study of signs within society, is a powerful tool of interpretation, able to facilitate the negotiation of multiple meanings from visual works. This article introduces the provenance of systemic-functional semiotic theory, and contextualises its application in the domain of drawing. Demonstrating the flexibility of a visual semiotics through the compilation of a chart

formulated for decoding visual (rather than linguistic) modes of communication, the article examines divergent interpretations through an analysis of selected drawing practice. Alternative interpretations and insights are shown to be negotiable as a result of a series of choices made by both artist and viewer. Semiotics reveals how images generally deemed to be straightforward and natural within their conventional discourse are actually cultural constructions, the result of social and historically formed positionings.

2. The Provenance of Systemic-Functional Semiotics

Semiotics is generally understood as the study of *signs*, and the discipline was first mooted in Europe by the Swiss linguist Ferdinand de Saussure (1916). Semiotics is often used to analyse how meanings are negotiated within the process of communication, but can also be useful as a means of synthesising work.

A *sign* is anything that can be used to stand for something else, or as Umberto Eco (1976:7) quipped “Semiotics is...the discipline studying everything which can be used to tell a lie...”, illustrated, for example, in Magritte’s famous warning about the treachery of words and images:

Fig. 1: Rene Magritte 1929 *The Treachery of Images* oil on canvas 60x80cms Los Angeles County Museum of Art.

As a linguist, Saussure realised that language was (and still is!) a system of arbitrary signs, *symbols* (written words, spoken sounds) which bear no relationship to their referents in the world: the word *pipe* bears no relation to a real pipe, and neither does the word *Ceci*, or ‘this’, as Magritte asserts. To that extent, Saussurean semiotics would seem of little use to visual artists.. However, the American philosopher Charles Saunders Peirce (1867), working much earlier, had already recognised a taxonomy of signs, including some which actually do bear relationships with their referents: *iconic* signs, which resemble their referents – as does Magritte’s image resembling a pipe, and *indexical* signs which are caused by their referents, as Magritte’s handwriting points to – indicates - the speed and pressure of the hand that made it. A synthesis of the insights of Saussure and Peirce affords the possibilities of a visual semiotics which *can* be of use to visual artists, and it is this potential we shall explore in this article.

3. Functions of Communication

Saussure's work influenced the Russian Formalists, who were theorising language and literature around the time of the 1917 revolution. Roman Jakobson (1958), a founding member of the Moscow Linguistic Circle and later a member of the Prague Linguistic Circle, developed a model of six *Factors* involved in the process of communication: the *Sender* and *Receiver* of the *Message*, within a *Context* involving the necessity for *Contact* and the sharing of a *Code*. These six factors have their corresponding six functions of communication: the *Emotive* drive of the Sender and the willingness – the *Conative* drive – of the Receiver to negotiate the *Poetic*, the function which draws attention to the Message itself, which is normally *Representational* of its subject-matter. The *Phatic* function ensures Contact is maintained, and the *Metalingual* ensures both Sender and Receiver share the same Code:

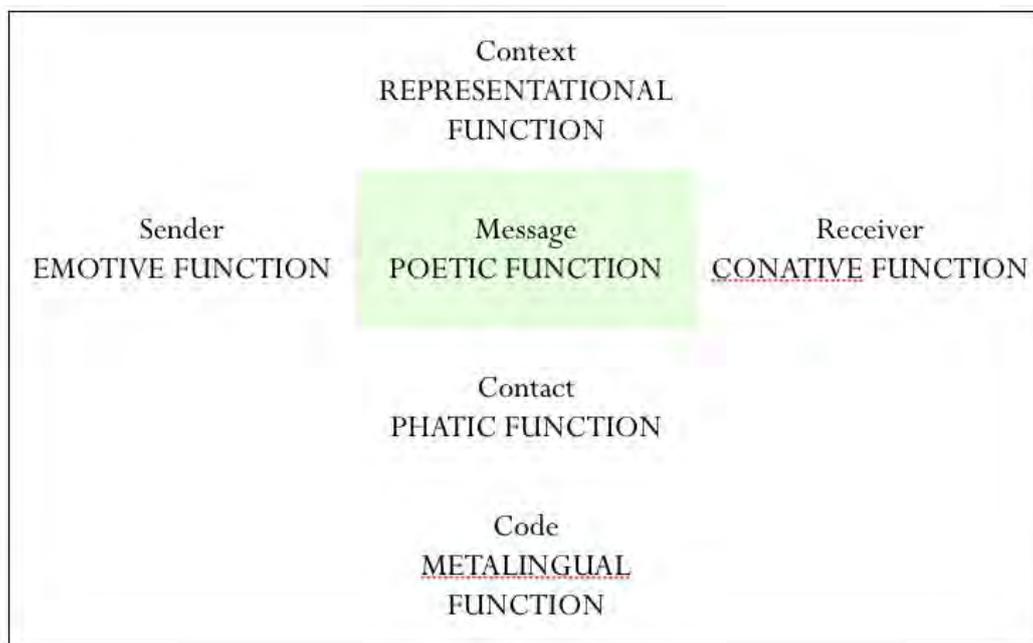

Fig. 2: Roman Jakobson 1958 *Model of Communication*.

For the purposes of visual artists, the Sender becomes the *Artist*, the Receiver becomes the *Viewer*, and the Message becomes the *Artwork*.

3.1. Systems and Functions in Semiotics

Systemic-functional linguistics is a theory of language derived and refined from Jakobson's model by Michael Alexander Kirkwood Halliday (1978) in the 1960s and 1970s. Essentially, Halliday noted that the Emotive function and the Conative function might be combined into an *Interpersonal* function. Jakobson's Representational function is re-named the *Experiential*, since what is represented are our experiences of the world, and Halliday recognised that the crucial function for any analysis of the arts – Jakobson's Poetic function – is actually about drawing attention to the formal qualities of the work, so although Halliday, working with language and written text, termed this function 'Textual', we shall retain Jakobson's original term, *Poetic*, for the model presented as figure 3.

The term *system* in systemic-functional semiotics stands for the ranges of compositional choices available to us. It is a term introduced by Halliday's teacher, linguist John Rupert Firth (1957) who also introduced the term *sociological linguistics* to locate the study of language within

its social perspective, suggesting that social context and language are *interdependent*: social context influences use of language; language-use influences social context. This interdependency is referred to by linguists as *register*, a concept equally applicable when visual artists consider how to compose a drawing suitable for a particular age-group, for example, or viewers from a specialist discipline. Firth followed the Russian linguist Mikhail Bakhtin (Holquist 1981) and members of his circle formed around 1917, who had recognised that communication in all its aspects was always *dialogical*, Bakhtin's term to explain the context of situation between the participants in any act of communication.

4. A Systemic-Functional Semiotic Model of Communication applied to Drawing

Finally, in this potted provenance of semiotic theory, during the 1980s and up to the present, Michael O'Toole (2011), a pioneer of visual semiotics working at Murdoch University in Perth, Western Australia, has argued that Halliday's model for language is equally potent when adapted for the analysis of visual codes of communication, and demonstrated this by analysing examples of painting, sculpture and architecture. In general terms, humans have devised visual codes of communication expressed through a variety of media and processes – for example, drawing, painting, photography, film – which function to make tangible to others our moods and attitudes towards the experiences represented. Specifically, in illustrative terms, we compose images which represent our experiences, or simply tell stories, and the processes of composition – our selection and combination of visual elements – affect the viewers' attitudes towards what is represented.

In terms of drawing practices, Firth's notion of *system* includes the range of mark-making media, the range of grounds, the range of compositional formats and sizes, the range of line qualities, textures, colours, in other words the elements of visual language available for selection and combination into a visual means of communication. Such choices carry the potential for meaning, *where there is choice, there is meaning*: for instance, the mark of a 6B pencil carries more potential for gestural connotations than the mark of a 2H pencil. Their potential for meaning comes from their differences.

Figure 3 represents a model of communication, adapted by the present author and research student Amanda Roberts (Riley 2014; Roberts and Riley 2012; 2012a) for the study of drawing from O'Toole's own adaptation of Halliday's model for language. In this model, the three functions are arranged horizontally, and the varying degrees of attention at which any work may be scrutinised are here arranged vertically and labelled *Levels of Engagement*, from the level of detailed scrutiny of individual marks within a work, right up to the work in its wider social context, where systems relating to display – of framing, lighting, or the placement of the work within a print format or on screen – might be studied. The matrix thus formed by these two axes contains the systems – ranges of choices – appropriate to each level of engagement:

Function Level of Engagement	EXPERIENTIAL (<i>what</i> is represented: experiences of the world)	INTERPERSONAL (<i>how</i> the viewer is <i>positioned</i> in terms of <i>mood and attitude</i>)	POETIC (<i>how</i> perceptual and emotional experiences are represented)
Drawing as Displayed	<i>Proximal</i> Perceptual Values. Theme Narrative Genre Representational/abstract Interplay of Episodes.	Attitude, Modality: Intimate/Monumental Public/Private Active/Passive Rhythm/focal points: Dynamic/Static Calm/Agitated	Overall format and size. Gestalt relations: horizontals, verticals, <u>diagonals</u> . Framing devices. <u>Colour palette</u> . Systems of Geometry: <u>persp ortho axo</u> etc.
Episodes of the Drawing	<i>Distal</i> Perceptual Values Primary Geometry (layout of surfaces and edges) Actions, events central to narrative. Distance between Surfaces in the Scene.	Position relative to scene (Orientation of viewer). <u>Gaze/eyework</u> . Modality: happy/gloomy, calm/excited etc.	Secondary Geometry: (perspective/non perspective projections). Interplay of figures/passages Contrast of tone/texture
Combinations of Marks (sub-assemblies)	<u>Haptic</u> Perceptual Values Edges: occlusion of surfaces Direction Transparency/opacity Atmosphere Time of day	Sense of 'affordances' in the scene. Heavy/lightweight Flatness/illusions of depth	Textural Qualities of Media/Ground. Relative Positions of Marks. Relative Sizes of Marks. Division of Picture- Plane: ratios, angles. Overlap of shapes/tones
Individual Marks	Effects of light on surfaces in the environment. Spatial Depth. Scene Primitives.	Sense of textural differences. Indices of mark- maker's movements: speed, pressure.	Position and Size of Marks within Picture Plane. Interaction between Medium and Surface. Picture Primitives.

Fig. 3: A Systemic-Functional Semiotic Model for Drawing.

Having introduced the systemic-functional model and indicated its provenance, it is time to demonstrate how it might be used to facilitate the negotiation of meanings available in drawing practices. This in part entails the identification of the formal compositional means through which an artist positions the viewer; "...to lay bare the device," as the leading Russian Formalist Viktor Shklovsky (1929: 147) advocated¹. Examples of the author's drawings are used as case studies.

¹ In his seminal history of the Russian Formalists, Victor Erlich (1965:182) explains:

"It is worth noting that this typically Formalist phrase (*laying bare the device*) is a free translation of a passage from William James' *Psychology*, dealing with the impact of verbal repetition on the perception of individual words. The passage was quoted by Lev Jakubinski in his essay on 'The Sounds of Poetic Language', *Poetica*, 1919. The original text reads as follows: '...it (the repeated word) is reduced, by this new way of attending to it, to its sensational nudity.' (William James 1928 *Psychology* New York p. 315). The Russian translation of James' work, Jakubinski's direct source of reference, actually anticipates the Formalist terminology: '...having thus looked at the word from a new viewpoint, we have laid bare (*obnazili*) its purely phonetic aspect'".

In practice, the application of the semiotic chart is more fluid than its rigid format implies. Interpretation and their implications need not occur in an ordered or linear way. While the chart offers a structure within which to separate and categorise these connections, images examined can offer several different interlinked observations, associations and responses simultaneously. Materialist or denotative readings of how and what the drawing communicates are necessarily combined with connotative understandings of what is negotiated.

5. Case Study: *Drawing Precedes Writing*

In the sequence of oil pastel drawings, Figures 4, 5, 6 and 7, little of what we experience and recognize in the physical world appears to be represented. Of course the drawings themselves (and, incidentally, the reproductions presented here) are a part of our physical world: the very textures produced through the combination of oil pastel and paper, scratched and rubbed, indicating their maker's involvement, may evoke in the viewer similar previous experiences of texture, and perhaps volume.

Fig. 4: Howard Riley *Depiction Precedes Writing 1*. Oil pastel on paper. 16x10cms.

Fig. 5: Howard Riley *Drawing Precedes Writing 2*. Oil pastel on paper. 16x10cms.

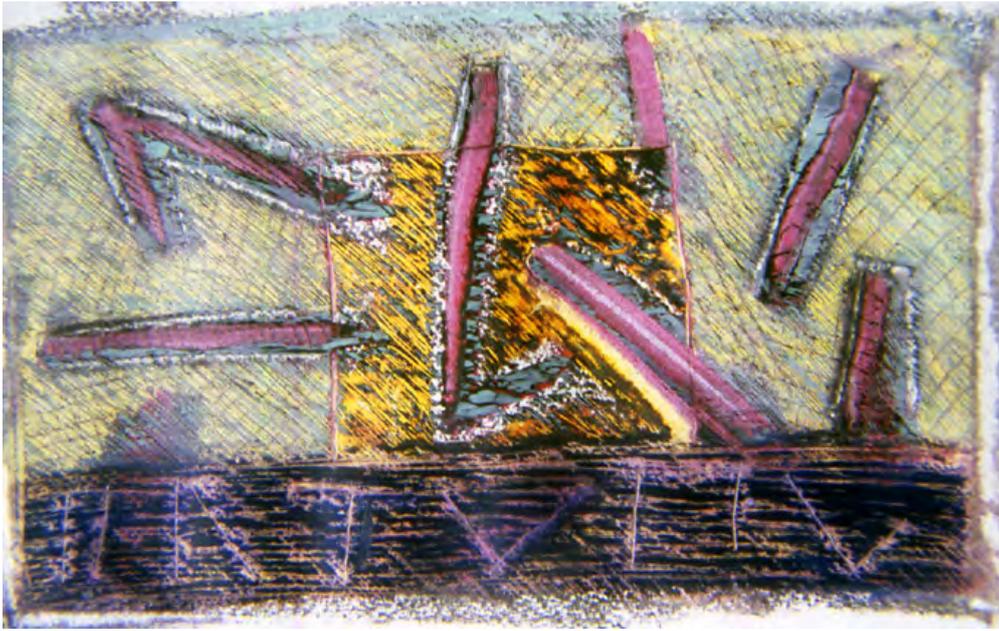

Fig. 6: Howard Riley *Drawing Precedes Writing 3*. Oil pastel on paper. 16x10cms.

Fig. 7: Howard Riley *Drawing Precedes Writing 4*. Oil pastel on paper. 16x10cms.

When the viewer engages with these drawings at the level of the *Combinations of Drawn Marks* then a pattern emerges which is common to all the drawings. The central position of the square, resting in each drawing on a horizontal base line, symbolises stability and epitomises visual balance, attributes associated with our facility for structuring order from chaos, metonymically representing our capacity for language. Against this constant compositional structure, change within the series is more easily recognized. At the level of engagement *Individual Marks*, through the choice of high-contrast boundaries between shapes of saturated colour and the selection of textural gradients and tonal gradients, illusions of depth are produced. As the sequence of drawings progresses, contrast is reduced and colours desaturated with the effect that

depth illusion is diminished. Colour combinations progress from warm to cool, thus altering the mood.

The solid square in the centre of figure 4 is set in ambiguous space, an illusion produced by the combination of light and dark tones arranged contrary to normal visual experience of the world illuminated by a single light source. In figure 5, the central square is surrounded by angular linear elements with no apparent Gestalt relationship: a chaos of elements whose edges vary from sharp to blurry, indicating various distances in the illusory depth of the picture. The effect of such random placement of pictorial elements within the subdivisions of the drawing's surface, together with the ambiguous readings of pictorial space, may well unsettle the viewer whose eye-paths are being jerked around, having no definite focus point.

Simultaneously, the viewer attempts to decode the ambiguous symbols - arbitrary signs emerging at the base of the pictures, an operation rather like word-captions anchoring images in more conventional codes of communication.

At this stage, viewers may pick up allusions to their visual experiences of the world - not least, allusions to illusions. This play between the drawer and the viewer, and the tensions induced in the viewer, is the essence of the *Interpersonal function* of drawing, made visible through the selection and combination of choices from the compositional, or *poetic* systems: specifically, systems of choices to do with the degree of sharpness or blurriness of contrast boundaries in the drawings, and to do with the tension between the static stability of the drawings' Gestalt structure (central square on horizontal line) and the dynamic instability of the randomly placed floating elements.

In figure 6, by appropriate selection of compositional choices from the systems of tonal grading, tonal contrast (at boundaries) and the relative positioning of marks, the tubular elements appear to occlude, or be occluded by, the now less-than-solid central square. Thus the illusion of penetration is evident: the visual elements occupying the chaotic background are becoming ordered through interaction with the central square, representing our capacity for structuring *via* language. With no more resolution of the quasi-alphabetic anchor-block (relay-block?) and no obvious representation of their physical experiences, viewers may resort to metaphoric interpretations. The sequence may be understood as the gradual dissipation of the central square, representing our capacity for language, from solid volume in figure 4 to tissue-like insubstantiality in figure 7. However, the tubular elements themselves become dissolved in the fabric of the picture plane in figure 7, even as the 'caption' becomes, temptingly, almost meaningful. This sequence of drawings illustrates the proposition that our ability to write comes from our prior ability to depict. Depiction precedes writing.

Writing itself has emerged from a background of visual ambiguity, metaphorically representing the chaos of our unstructured world, and has pierced and penetrated our observations of the material world to such an extent that the two have become one: language is interwoven with our perception of the fabric of the material world, we see the world through the filter of language yet its visible form remains forever arbitrary, forever open to negotiation.

6. Conclusion

An application of the systemic-functional semiotic model is shown to facilitate the negotiation of meanings generated from the drawings. Subsequently it is concluded that no drawing practice is beyond the realm of the semiotic, and semiotic analysis is applicable across the whole domain of visual imagery as a method of generating meaning. This article has demonstrated specifically the rich potential of gestural drawing as a means of illustrating social relations at the heart of all representational art: the relations between subject-matter, artist and viewer. A model of systemic-functional semiotics such as the one featured in this article might well inform the

future practice of those interested in extending the potential meanings of drawing in particular, and those of visual imagery in general.

POLISEMIOTICITY OF VISUAL POETRY BY VIKTOR ZHENCHENKO

Iryna Zhodani
National University of “Kyiv-Mohyla Academy”, Ukraine
zhodani@yandex.ua

Abstract

In modern art writers very often choose not only traditional ways to express their emotions and thoughts. Sometimes they use more than one secondary modeling system (according to terms by the Tartu-Moscow school of semiotics). There are a lot of words which pertain to the phenomenon of synthesis of some arts (intermediality, heteromediality, heteroperceptuality, creolization, interaction of arts and so on), but to my mind, if we use the methodology of semiotic, the best of them is the term of the Polish researcher Marta Kaźmierczak “polisemioticity” which has a parallel with intersemioticity.

This thesis is dedicated to synthesis of literature and graphic arts in visual poetry by a Ukrainian author Viktor Zhenchenko (books “Visual Poetry” (2000) and “Thirst for Two People” (2001)). A lot of his works are about tragic events in the Ukrainian history such as Kolyma, famishment, genocide, Gulag, prohibition of the Ukrainian language, extirpation of the best Ukrainian writers, painters, scholars and other people of culture and science.

Visual poetry by Viktor Zhenchenko is full of verbal and graphic symbols which supplement each other and create the new composite whole. In his works we can see many Ukrainian and international symbols, such as wing, gallows, boots, labyrinth, square, circle, candle, sabres, swallows and so on.

The separate part of the book “Thirst for Two People” is the alphabet for adults where each letter is associated with some important idea-symbol.

Visual poetry by Viktor Zhenchenko consists of different codes and the author is permanently looking for new and original forms of this synthesis of two secondary modeling systems.

His works are characterized by graphic imagery, non-linearity of perception and versatility of significance which is inherent to the symbol.

In modern art writers very often choose not only traditional ways to express their emotions and thoughts. Sometimes they use more than one secondary modeling system (according to terms by the Tartu-Moscow school of semiotics).

There are a lot of terms which pertain to the phenomenon of a synthesis of some arts. The formation of these words is reflected in the table below.

prefix / root	multi- (from Latin <i>multus</i> 'much, many')	poli- (from Greek <i>poly</i> 'much, many')	inter- (from Latin <i>inter</i> 'between')	hetero- (from Greek <i>heteros</i> 'other')	without prefix
semiotic	multisemioticity	polisemioticity	Inter-semioticity		
medium (-a)	multimediality		Intermediality	hetero-mediality	
mode, modal	multimodality				
code	multicodal semiosis				
sense, sensory	multisensoriality				
percept, perceptual				hetero-perceptuality	
creolization					creolization
synthesis of arts					synthesis of arts

Table 1: Formation of terms which pertain to the phenomenon of synthesis of arts.

In the table you can see that there are different roots (*semiotic, media, mode, code, sense, percept*) and different prefixes by Latin and Greek origin (*multi-, poli-, inter-, hetero-*) from which scholars coin new words that name the phenomenon of synthesis of some arts. To my mind, such roots as “media”, “mode”, “sense”, or “percept” are too general and relate to other subjects. For example, “media” is associated with mass media, “sense” and “percept” – with psychology, “creolization” – with anthropology, “code” – with the theory of information, and only the root “semiotics”, to my mind, is the most relevant because it also refers to the methodology of semiotics.

The prefix “hetero-” means “other”, that is why we cannot use it to name a synthesis of arts. The prefix “inter-” means “between” and it can be used when we talk about the translation from one art to another. The prefixes “multi-” and “poli-” have the same meaning “much, many” and we can use them to write about a synthesis of arts. That is why I think that the most specific terms for the phenomenon of a synthesis of arts when using the methodology of semiotics are “multisemioticity” and “polisemioticity”.

Visual poetry is one of the forms of such phenomenon. It has an ancient tradition in Ukraine, in particular in baroque epoch. But in the XX century, when visual poetry was very popular all over the world, this form of art was suppressed in the USSR as formalism. For example, Viktor

Zhenchenko remembers how a KGB agent threatened him to deport to the Kolyma region for his 3 visual poems published in a newspaper (Moisiyenko 2001: 19). That is why only now visual poetry in Ukraine is becoming very popular.

This paper is dedicated to the synthesis of literature and graphic arts in visual poetry by the Ukrainian author Viktor Zhenchenko. He is a famous opera singer (bass), poet and translator. He has written 11 collections of poetry, and two of them consist of visual poetry: *Visual poetry* (2000) and *Thirst for two people* (2001) books. His son, Igor Zhenchenko, is a graphic artist, who helped his father to draw the visual part of the poetries in the above-mentioned poetry collections.

The basic themes of the analyzed books are tragic events in the Ukrainian history, such as Kolyma camps, famishment, genocide, Gulag, the prohibition of the Ukrainian language, repressions of the best Ukrainian writers, painters, and scholars.

One of the famous visual poetries by Viktor Zhenchenko is the “Tragedy” poem. It describes a Gulag labor (in fact, concentration) camp with especially hard conditions of life and work which was situated at the Kolyma, a region in the Russian Far East. Aleksandr Solzhenitsyn called it “the pole of cold and cruelty” because in the years of mass repressions (1932–1954) near one million people were killed there, and a lot of them were Ukrainians. For instance, the killed victims included Mykhailo Drai-Khmara (a Ukrainian famous writer and professor who knew 19 languages). Therefore, for Ukraine Kolyma became the symbol of cruel treatment, coldness, death, and extirpation of the best Ukrainian people.

In visual poem by Viktor Zhenchenko, we can see the word “Kolyma” which looks like a barrack because of its grey uneven surface. The barbed wire is around this word. It symbolizes the pain of the prisoners who suffered mainly for their love to Ukraine like Jesus suffered for all people. Under the visual part of poem we can read the text: “Snows, barracks, wire, darkness... And cry of millions people: ‘Mother! Mo...’” In Siberia the winter continues up to 8 months with a lot of snowfalls, strong winds and the temperature falling down to 60 degrees below zero. Thus, the people who came back from Kolyma remember only snows, barracks, barbed wire and darkness. To my mind, here darkness also means a victory of evil, despair and hopelessness. The culmination of this visual poem is the torn off word “Mother”, which means tearing off lives of millions of people.

Another work dedicated to this theme is “The Telegram to Swallows”, in which we can see a telegraph pole and five swallows near it. Under the wires, we can read the text: “Mordovia stains with blood FS Vasyl Stus is crucified as Jesus FS No cries, no repentances FS This is not people, but Herod FS”. (Here I use my own abbreviation “FS” from English words “full stop” to reproduce the style of telegram as it was done in the Ukrainian text by the author.)

Mordovia is a Russian republic, in which a maximum-security labor camps were located, too. In 1980-s, almost all the members of the Ukrainian Helsinki Group who had been fighting against violations of human rights were prisoners of this camp. One of them was Vasyl Stus, a talented writer, who was nominated to the Nobel Prize (According to some sources, in 1984 The International Committee for Awarding the Literary Nobel Prize to Vasyl Stus in 1986 was founded in Toronto. In conformity with other sources, H. Bell nominated him in 1985). However, the Soviet Union leaders did not want to have any Ukrainian Nobel prize-winners. They knew that this Prize is awarded to alive people only. That is why, according to the memoirs of prisoners, Vasyl Stus died in very mysterious circumstances. All of his prisoner friends think that he was killed because of the Nobel Prize prospect (Ovsiyenko 2011).

Vasyl Stus was a political prisoner in Mordovia during 7 years, but he died in a camp in Perm region. I think that Viktor Zhenchenko use here the word “Mordovia”, firstly, because of Stus’s lost health there and, secondly, because of the consonance between the words *Мордовія* and

мордувати (which translates as ‘torture’) in the Ukrainian language. In such way he wanted to come into notice to death of Vasyl Stus as a result of tortures. That confirms the following line of the poem: “Vasyl Stus is crucified as Jesus FS”. The telegraph pole looks like the cross which Jesus was crucified on. Here we can see again a parallel between the Ukrainian intellectuals and Jesus Christ. This story continues in the last sentence where the author compares Russian nation with Herod because of the lack of repentances for their actions.

Let us turn to the picture of visual poem. We can see five swallows there. According to dictionaries of symbols and signs, a swallow is connected with Jesus Christ (Adamchuk 2006: 97) and it symbolizes the Resurrection (Roshal 2005: 820). It is a pure bird (Voitovych 2005: 408), in contrast to evil raven (Voitovych 2005: 408) whose silhouette we can see at the end of the broken wires. The broken wires symbolize here the broken lives of the Ukrainian political prisoners. Three ravens on the old version of this visual poem (book *Visual Poetry*, 2000) are the confirmation that it is not only an illusion. This opinion can also be supported with the Ukrainian abbreviation *KP* (from word *кранка* – ‘full stop’), which is so consonant with the Ukrainian raven’s caw *кап* ‘kahr’. In the Ukrainian folk ballads a cawing raven always foretells the death of the Cossack (Cossacks were free warriors in the territory of Ukraine in XV–XVIII centuries who protected their lands from enemies. Cossacks have been national heroes for Ukrainian people. There are a lot of songs, ballads and stories about them.). That’s why in our country raven is a bad bird that brings death, tears and evil (Talanchuk 2002: 336–341). Under the flying ravens, we can see the grave. Comparing old and new versions of visual poem we can draw a conclusion that the author evolves from sullen and black work (grave, cross, three big black ravens and only three small swallows) to more positive and lighter work. In the new version of visual poem we cannot see any more the grave and big black ravens and the number of swallows increases from 3 to 5. To my mind, in such way the author tries to show the win of good under the evil.

The next visual poem “Target” continues the theme of the difficult fate of a poet. We can see the target where numerals are substituted with the following words: “The word of poet, and heart, and body were always under the battle sight”. Besides that on the target we can read the surnames of poets who were killed. In the table there are names, ages and reasons of death of each writer from this visual poem.

Name	Age	Reason of death
Ukrainians		
Vasyl Stus	47	he died in a camp in Russia
Jevgen Pluzhnyk	37	he died in a camp in Russia
Mykhailo Drai-Khmara	50	he was shot in a camp in Russia
Vasyl Symonenko	28	he was killed by the KGB agents
Mykhail Semenko	44	he was shot by the KGB
Mykola Zerov	47	he was shot by the KGB
Mykola Voronyj	66	he was shot by the KGB
Oleg Olzhych	36	he was killed in a German concentration camp
Olena Teliga	35	she was shot by the Gestapo

see the gibbet with the following text on it “This gibbet is new. Only words are hanging on it. Only words” and the word “LANGUAGE” under the noose.

This poem sends us back to XVIII–XX centuries when the Ukrainian language was forbidden by Russian and Soviet Union leaders. For example, in 1720 tsar Petro I issued the decree to prohibit printing of Ukrainian books. In 1763, tsarina Kateryna II issued the decree prohibiting the teaching in Ukrainian language in Kyiv-Mohyla Academy. In 1876, Oleksandr II signed Emsky decree which prohibited the printing and importing the Ukrainian books, producing Ukrainian plays, and teaching in the Ukrainian language in schools. There were many of such orders, decrees and acts.

At that time even some words were forbidden, so that the phrases had to have Russian forms, and the whole Ukrainian language had to be similar to Russian as much as possible. By that time, some Ukrainian words had already been forgotten. This poem tells us about such killed words. The language consists of words and after the deaths of words comes the death of the whole language. The shade of this killed Ukrainian language we can see under the noose.

Another visual poem is “Ancient experience”. The work consists of the picture of high boots and the following text: “– Who realizes revolutions? – Boots. – Who balances pro and contra? – Boots. – Whose idea is to occupy the world? – Boots.”

The boots in the picture are quite like tarpaulin boots which are used mainly in the army. These boots have eyes, a nose and a big mouth with teeth. In the dictionary of symbols and signs teeth are an image of aggressiveness and strength (Adamchyk 2006: 46). In Greek mythology soldiers of Jason grew from a dragon’s teeth. A mouth is linked with taking food and therefore with destruction as well. As an organ which devours food, a mouth can be connected with power (Adamchyk 2006: 171). In the visual poem, one tarpaulin boot is turned left. To my mind, it was done because the author wanted to pay attention to a big mouth and big teeth.

The symbolism of boots which personify the idea of power and holding (Adamchyk 2006: 171) may be confirmation of this thought. So, Viktor Zhenchenko tries to tell us that from ancient times and to our civilized time the force incarnated in an army governs this world. Not intellect, but only force.

The visual poem “Stamp of chauvinist” also concerns our history when the words “independence”, “nationhood”, “freedom”, “sovereignty” and “indivisibility” were forbidden. People who drew attention to these ideas were killed or imprisoned. Such fate was common for most Ukrainian intellectuals. Among them there were a lot of writers and professors, actors and scientists, and many others.

Russian chauvinists are still afraid of these words in our days. They are ready to seal stamp “NO” on every one of these ideas. Of course, a stamp is a symbol of power (Adamchyk 2006: 147), and in this context we understand that the author had in mind the most influential chauvinists, perhaps the leaders of Russia. Besides that in the picture we can see the road sign “Stop!” which also, in their opinions, has to stop the movement of Ukraine in this direction.

The following two visual poetries “Moan” and “Fate” are dedicated to the passivity of contemporary Ukrainians who have forgotten about the glory and heroic deeds of their forefathers. “Among thirsty steppes grey-haired glory moans during centuries, calling her replete, sleepy contemporaries.” This text is written on the four sabres which create the Ukrainian letter “C”. In the original text every word in this poem begins with this letter constructing alliteration: “*С*еред *с*праглих *с*тепів/*С*тогне *с*толіттями *с*ива *с*лава/*С*кликаючи *с*воїх *с*итих/*С*онних *с*учасників”.

For Ukrainians, steppe (a big plain without forests) is a symbol of freedom and independence because Zaporizka Sich was built just there. It was a military-administrative organization of the Zaporizhian Cossack Host in XVI–XVIII centuries in the central part of Ukraine. It was

the place free from tsars, masters and other people who enslaved everyone. But it was also a dangerous place because of its natural unprotected state (I mean the open plain) and the necessity to defend the Cossack territories with sabres in hands. The glory of the victories over enemies branched forth on the whole Ukraine. But now it is old grey-haired glory because in our days Ukrainians are complacent and sleepy. They do not want to fight for their freedom. That's why the glory moans when it sees how contemporaries turn to the status of slave. It has been continuing for 3 centuries: since 1775, when Russian tsarina Kateryna II ruined Zaporizka Sich. From that time Ukraine no more had such a powerful army. (I want to remind that this poem was written in 2000–2001 before the Orange revolution in 2004 and the Revolution of Dignity in 2014).

The visual poem "Fate" continues this theme. In the picture we can see the Ukrainian big letter "P", which begins the word *раб* ('slave'), and the man who embosoms legs of his master. Besides that there is the following text: "Oh, God! Even new age can't throw out slave from us." After the long supremacy of Russian state Ukrainian free people begin to teach how to serve the tsar and this lesson lasted during 3 centuries. That is why to this time some Ukrainians find tsar, because they got used to be slaves. Viktor Zhenchenko dispraises these slavish habits of contemporaries.

The visual poem "Immortality of Ravel" is dedicated to bolero. It is the Spanish folk dance which is doing mainly by couple. This is a very passionate dance with graceful movements, slowing steps, significant pauses, and expression of postures.

The most popular bolero was written for ballet by French composer Maurice Ravel in 1928. It is so famous that Viktor Zhenchenko writes about Ravel's immortality because of this work. The visual poem consists of word "Bolero" in which each letter is placed not straightly and looks like scheme of steps by dancer. The last step develops into the turning. Inside of letter "O" we can read such text: "Bolero is the dance, the torment, the circle, from which you will never get out. It turns you and turns. And you no more want to turn in this lenten and protocol being from this magic circle".

The circle is a symbol of infinity, perfection and the absolute (Sheinina 2003: 31) and here it emphasizes the perfection of Ravel's music. Besides one of the most popular stagings is the production of ballet by Maurice Bejart in which the principal dancer dances on the big round dais. Maybe just that staging inspires Viktor Zhenchenko to use the symbol of circle in his poem.

Conclusions. The visual poetry by Viktor Zhenchenko is full of verbal and graphic symbols which supplement each other and create the new composite whole. In his works we can see many Ukrainian and international symbols, such as the cross, circle, grave, gibbet, boots, sabres, swallows, ravens, teeth, mouth, stamp, and others. Some geographical objects (like Kolyma, Mordovia) and persons (like Jesus Christ, Vasyl Stus) also became symbols in his visual poetries. Even the letters Viktor Zhenchenko uses for this aim. We could see Ukrainian letters "І", "С" and "Р" in such role. The poetries with these letters were taken from the separate part of the book "The alphabet for adults" where each letter is associated with some important idea-symbol.

The visual poetry by Viktor Zhenchenko consists of different codes and the author is permanently looking for new and original forms of synthesis of two secondary modeling systems – literature and graphic arts.

TAKING A STEP OUTSIDE THE PHOTO AND FRAME: HOW SHOULD DRAWINGS BE ANALYSED IN THE CONTEXT OF GEOGRAPHY EDUCATION?

Markus Hilander
University of Helsinki, Finland
markus.hilander@helsinki.fi

Abstract

The combination of geography and semiotics seems to be rather rare. Nonetheless, geography as a discipline has always been visually oriented because of the usage of maps. However, geographers tend to be interested in the final meanings of visual representations rather than the processes during which the meanings are being produced. To approach these processes, we printed a photo taken in New York City (2008) on an A3-sheet and asked in total 64 Finnish high school students to draw around the photo. Next step of our study is deciding in which ways we are to analyze the drawings in question; during our presentation, we hope to gain new ideas from the audience to approach our data-set.

In the 1970s, Roland Barthes stated that connotations are likely to be important in semiology. He continued that connotative phenomena have not yet been systematically studied. In addition, a Finnish researcher, Virpi Blom, has said that the analysis of connotation is in the heart of interpretation. When it comes to the drawings we have collected, we can, for example, focus on what sorts of connotations the students have drawn. In her book, *Decoding Advertisements*, Judith Williamson approaches advertisements both as signifieds and signifiers. The same division can be used for drawings as follows: when the photograph itself is the signifier, the drawing is dominated by the photo; instead, when the drawing is the signifier, the drawer abandons the ready-made signified (the photo), and a semiotic act will take place. The former example is to do with synecdochal signs, the latter with metonymic signs. When it comes to visual literacy and semiotics, iconicity, indexicality, and metonymic signs are said to be the most important aspects we should concentrate on. It was Barthes who said that there is an abundant literature

on metaphor, but next to nothing on metonymy.

In addition, there are other interesting findings in the drawings; one, for instance, is whether the students have drawn people in their city landscape or not. It seems that quite often people are not drawn. Is it because of a human being is somewhat difficult to draw or do youngsters really not consider people to be part of an urban landscape?

1. Introduction: A drawing task

The combination of geography and semiotics is rather rare. Nonetheless, geography as a discipline has always been visually oriented because of the usage of maps. Therefore, geography has much to do with signs, as well as communication and the difference between illusion and reality (Cobley 2010: 3); maps and their coordinates work as indexes locating places on the globe. However, geographers tend to be interested in the final meanings of visual representations rather than the processes through which the meanings are produced. To approach these processes, a photo taken by Markus Hilander (2008; see Figures 1 and 2) in New York City was printed on an A3-sheet and a total of 64 Finnish high school students were asked to draw around the photo. In addition, members of the audience of the presentation at the World Congress of Semiotics in Sofia, Bulgaria were asked to draw their mental images. Once a researcher has collected a visual data-set, many questions must be faced about the ways in which to approach it. The next step of the research was to make a final decision about how to analyse the drawings collected.

The present plan is to examine the idea of *punctum* by Roland Barthes (1981) and his “blind field” (*champ aveugle*); that is, to consider the surroundings of a photo that have been cut off from the photo itself (Knuuttila 2007: 49). If we should draw our mental images around a given photograph, what sort of signs would those drawings be? To what extent would these drawings explain and give meanings to the photo itself? The instruction for the high school students and the audience in Sofia was as follows: “What sort of things and mental images do you relate to the photo? Imagine you could expand and/or continue the photo and the landscape it depicts by drawing around the photo”.

In this methodological paper, two concepts to conduct a content analysis of the drawings are introduced. As a geographical way of approaching the drawings, the “development compass rose” that is introduced in literature of didactics of geography (e.g., Lambert, Morgan, and Swift 2004) is used. Likewise the four principal compass points, elements in the drawings are sorted into four domains: natural, social, political, and economic. Eero Tarasti also finds four cases in his “Z model” that are used as a semiotic way of interpreting the drawings. Tarasti’s categories are as follows: body (M1), identity and personality (M2), social roles and institutions (S2), and norms and values (S1). The final aim of the research project will be opening up what sorts of information can and cannot be reached with these analytical tools.

Next, the photos and drawings are examined as two types of connotations: signifiers and signifieds. Then, the development compass rose and the Z model will be introduced and it will be demonstrated how they could be used as vehicles for an analysis. For illuminating the models, two examples of the drawings made by the audience of the presentation in Sofia will be submitted.

2. Two types of connotations

In the 1970s, Barthes (1977: 85) stated that connotations are likely to be important in semiology. He continued that “[c]onnotative phenomena have not yet been systematically studied” (Barthes 1977: 90). Furthermore, a Finnish researcher, Virpi Blom (1998: 212), has said that the analysis of connotations is at the heart of interpretation. When it comes to the drawings that have been collected, it is possible to focus on what sorts of connotations the students and the

audience of the presentation have drawn. In her book, *Decoding Advertisements*, Judith Williamson (1978: 31–36) approaches advertisements as both signifiers and signifieds. The same division can be used for the drawings. When the photograph itself is the signifier, the photo dominates the drawing; on the other hand, when the drawing is the signifier, the subject abandons the ready-made signified (the photo), and a semiotic act will take place (Tarasti 2000: 139). Photographs depict only a part of the landscape by the *pars pro toto* principle; this makes photos metonymic signs (Knuuttila 2007: 47). In visual literacy teaching, icons, indexes, and metonymic signs are emphasised as the most important aspects (Seppänen 2008: 191). Barthes (1977: 61) said that “there is an abundant literature on metaphor, but next to nothing on metonymy”.

2.1. The photograph as signifier

Williamson (1978: 31) states that a “product, which initially has no ‘meaning’, must be given value by a person or object that already has a value to us, i.e., already means”. Therefore, the product being advertised—or as in this research, the drawing—is the signified, and the correlating thing is the signifier (Blom 1995, 8: 17–18). In a case where the photograph’s elements continue smoothly to the drawing, the drawing is dominated (d-ed) by the photograph; hence, the photograph is the signifier (Tarasti 2000: 139). In Figure 1, the printed photograph depicting the city of New York with people, cars, and skyscrapers can be seen. On the right side of the photograph, there is half a building, which the subject has completed leaving the left side totally blank. Gillian Rose (2012) says that these sorts of signs, or connotations, are synecdochal signs. She writes that this “sign is either a part of something standing in for a whole, or whole representing a part” (Rose 2012: 121). There is an advertisement for a Finnish shipping company that is a good example of a synecdochal sign; even though only the letters *NG LI* can be seen, Finns will understand that the letters stand for *Viking Line* (e.g., Hilander 2013).

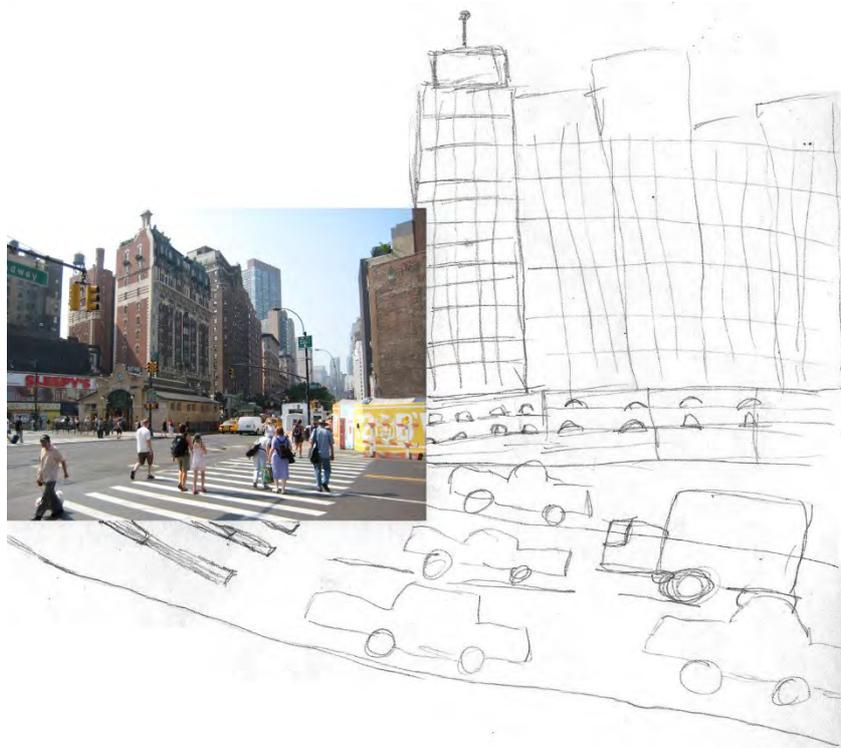

Figure 1. Drawing by a 27-year-old woman from Brazil

2.2. The drawing as signifier

When meanings are transferred to the product from other objects that co-exist in the advertisement, the product itself comes to mean. The product becomes the sign itself, the signifier, which gives meanings to its surrounding elements and events (Williamson 1978: 34–36; Blom 1995, 8: 18–20). The product, or the drawing, now has the power; it becomes the dominant (d-nt) (Tarasti 2000: 139), whereas the role of the photograph is reduced to a signified. In Figure 2, the subject has implemented a semiotic act and abandoned the ready-made signified; he has drawn elements, such as a television, a shelf, and a sofa, that do not have much in common with the urban landscape depicted in the photo. Rose (2012: 120) calls these kinds of connotations as metonymic signs; it is something associated with something else, which then represents that something else. In this case, the drawing explains the photograph's connotations by filling the blind side with the subject's own ideas, thoughts, and mental images. Next, the development compass rose and the Z model are introduced and Figures 1 and 2 analysed more in depth.

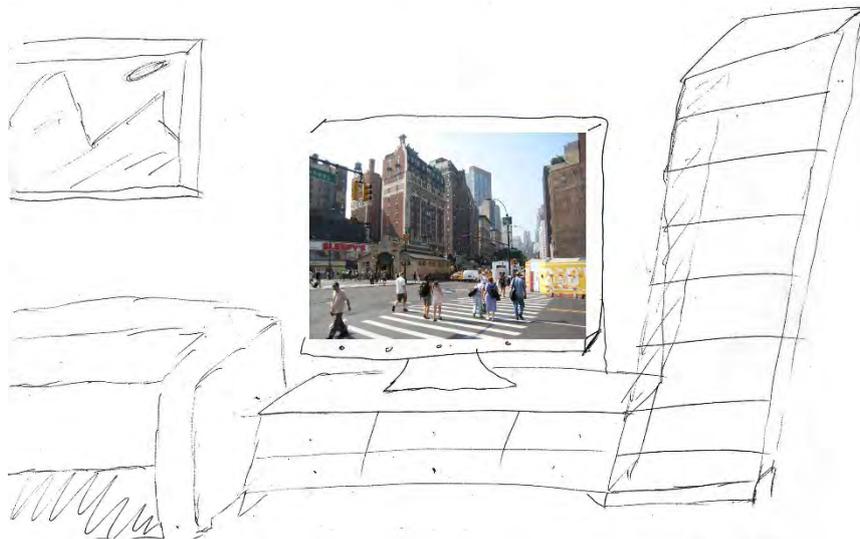

Figure 2. Drawing by a 46-year-old man from Greece

3. The development compass rose

The four domains that the development compass rose encourages the viewer to attend to and explore the links between are natural, social, political, and economic. A teacher or a researcher can place an image, an issue, or a phenomenon in the centre of the compass. A range of questions about the place and situation that the photograph *re*-presents (see, Conclusion) can be generated for each of the four compass points. These can then be compared with questions generated about an apparently different situation, and the commonalities between them explored (Tide global learning 2014: n.p.). The domains are:

1. *Natural domain*: These are questions about the natural as well as the built environment: energy, air, water, soil, living things, and their relationships to each other.
2. *Social domain*: These are questions about people, their relationships, their traditions, culture, and the ways in which they live. It includes questions about how gender, race, class, and age affect social relationships.
3. *Political domain*: These are questions about power, who makes choices and decides what is to happen and who benefits and loses as a result of these decisions and at what cost.
4. *Economic domain*: These are questions about money, trading, aid, ownership, buying, and selling.

In Figure 1, there are no elements of the natural environment drawn; only the built environment in a form of skyscrapers is present (natural domain). At the same time, the skyscrapers indicate wealth and money (economic domain). In addition to the natural environment, people are also excluded from the drawing (social domain). However, private motoring can be interpreted as a cultural feature; perhaps the subject imagines that people are inside the cars and buildings (see, Hilander 2012: 221). The non-visible people could be local because they are driving their own cars; vehicles drawn have not been marked as public transport or taxis.

In Figure 2, the natural environment is present in the form of a painting with mountains (natural domain). The television and other furniture—a sofa and a shelf—imply the wealth of the resident (economic domain). However, the drawing does not give any hints about where in the world the apartment might be located (social domain).

4. The Z model

In his theory of existential semiotics, Eero Tarasti introduces the Z model. It discovers the movements between the subject and the society. Tarasti (2012: 328) refers to the subject by a French word *Moi* and to the society by *Soi* that means “the subject observed by others”. With his theory, Tarasti (2012: 316) takes part in philosophical and methodological discussions of signification conceived in the 2010s; that is, he aims for what is called “neosemiotics”. However, this paper will not concentrate on the philosophical background of the model (see, e.g., Tarasti 2012). Tarasti (2012: 330) calls his model a “Z” model considering its inner motions between four categories. In order to conduct a content analysis of the drawings using the Z model, the four categories must be taken as independent entities. They are:

1. *M1*: This represents the ego and the body, which appears as kinetic energy, desire, and gestures. The ego is not yet conscious of itself, but rests in the naive Firstness of its being.
2. *M2*: This is the category in which the mere being of the subject becomes existing, as in Peirce’s Secondness. Ego discovers its identity, personality, and reaches a certain kind of stability or permanent corporeality via habit.
3. *S2*: This is about societal and institutional practices. It consists of applied values, choices, and realizations from *S1*.
4. *S1*: This is an abstract category that refers to norms, ideas, and values, which are purely conceptual and virtual; they are potentialities of a subject, which can either be actualized or not into *S2*.

In Figure 1, *M1* and *M2* categories are not present because there are no people drawn in the picture. The subject has continued the pedestrian crossing, which can be taken as a moral sign of *S1*; for instance, cars are not permitted to drive over people. The crosswalk could also be interpreted as a recommendation for walking. Private motoring tells something about values (*S1*) and pollution. Moreover, as a daily practice, private motoring can be linked to *S2*.

In Figure 2, the subject has drawn a painting with mountains that can remind some people of leisure: hiking, travelling, and downhill skiing. These activities are related to body, and, therefore, to *M1*. The apartment’s interior decoration with the television, sofa, and shelf—that is, incidentally, depicted as tall as the skyscrapers in Figure 1—describes the dweller’s personality (*M2*). The furniture also hints that the dweller has enough money to buy them (*S2*). However, the viewer cannot know if the dweller is watching a documentary about New York City voluntarily or forced (*S1*).

In summary, there are at least two differences in the results depending on which one of the models is used in the content analysis. Firstly, when using the Z model, *M1* and its body trigger the viewer to think about the meanings of the painting with mountains in Figure 2. Does the subject or the potential apartment dweller like downhill skiing? If so, is the subject or the

dweller more of an outdoor person than indoor person? Does the subject or the dweller live in a city or in the countryside? Answers to these questions depend on where in the world the subject or the possible dweller lives. The background information tells us that the subject is from Greece; the largest ski resort in Greece is close to Athens. However, it might be more intriguing not to consider the lifestyle of the drawer himself, but to determine how the drawing explains the photo and its meanings. In this approach, there is a profound juxtaposition, or a binary, of natural and urban landscapes in Figure 2. In the context of the drawing and the photo, it seems that the documentary about New York City on television is more exotic than the painting and all the possible outdoor activities to which it refers, because the painting on the wall is in sight round-the-clock, whereas the documentary lasts only for a while. However, one could argue that the apartment itself in the picture indicates the busy life of a citizen rather than a life spent in the countryside. In addition, mountains can also be associated with other things than just outdoor activities, for instance, with danger and the unknown, or climate change.

Secondly, the meaning of the pedestrian crossing, in Figure 1, would not stand out if the development compass rose had not been satisfied. The pedestrian crossing could be associated with the third domain of the compass, that is, the political domain and its decision-making dimension. However, the crosswalk as a *punctum* was not revealed until using the Z model. It was specifically the S1 category that suggested the ways in which figure 1 expresses values and norms.

5. Conclusion: What is the source of meanings in the photo?

Comparison of different methods can be useful and advantageous as long as the aim is not solving which one of the methods is the best. Instead, the aim should be to deepen the interpretations with the help of different views and perspectives that the various methods provide (Rakkolainen and Ehrling 2010: 347). In a case where the researcher uses pre-existing codes, the research can be called “etic” derived research. Based on the very limited experience of using the development compass rose in this paper, this might be called etic research. The four domains – natural, social, political, and economic – appear somewhat stiff and inflexible as a tool for content analysis. With the compass points and their questions, it is difficult to see beyond the drawings and their elements into the meanings.

When the researcher allows the data-set to represent, the research is based on the “emic” viewpoint, that is, the viewpoint of the interviewee, informant, or the data-set (Rakkolainen and Ehrling 2010: 326–327). The name of the Z model is an abbreviation for Zemic model; “Z” describes the motion between the four categories and “emic” refers to the fact that the movement takes place within the model (Tarasti 2012: 330). The inner motion of the model is thus included in the name itself. From this perspective, the Z model helps in considering the elements drawn in a wider and more complex way than the development compass rose allows. Nonetheless, both models produce different sorts of information that complement each other.

One must keep in mind that the data-set introduced here is very minimal. The audience of the presentation in Sofia gave us in total 11 drawings and only two examples of those are given in this paper, because the aim was not to introduce finished research results, but to discuss different options for conducting a content analysis. However, according to the outcomes of the development compass rose and the Z model regarding the two drawings, slight differences can be noticed. The former seems to lean more on the expectations of the viewer and the researcher, whilst the latter gives an opportunity to stay open to the data-set helping the researcher to engage in the drawings made by young people. This is very welcome in geography education where the aspects of everyday life of young people are increasingly significant (Tani 2011).

In addition, there are other interesting aspects to search for in the drawings, such as the pres-

ence or absence of people. It seems that quite often people are not included in the drawings. Is this because a human being is somewhat difficult to draw or because people are not considered to be part of an urban landscape? In the photo of New York City, there is also one geographical hint on the upper left corner regarding the location where the photo has been taken. Unfortunately, neither one of the subjects paid attention to the tip leaving the [Bro]adway sign uncompleted.

It is desirable that a researcher does not think that the research is finished after the process of coding the data-set. The next step is to analyse and interpret the coded data-set and answer the research questions. In this study, the question was asked what sort of information it is possible to gain with the different methods on which content analysis is built. The bigger picture, or a research task, is as follows: because a photo never completely presents the world, that is, it can never present the world objectively, does it then *re-present* the worldview of the photographer or the viewer?

WHAT IS A LETTER?

Robin Fuller
Trinity College, Dublin, Ireland
rofuller@tcd.ie

Abstract

“What is a letter?” may at first seem to be a grammatological question; a question for those who study writing systems. Historically this question has often been seen as unproblematic – letters are symbols for sounds organised according to the *alphabetic principle* wherein each letter stands for a single phonetic segment. That alphabetic orthographies often depart from the alphabetic principle has, historically, not been taken as counter evidence undermining the legitimacy of the alphabetic principle but as evidence that letters have been misused (Harris 1986: 101). More recent studies of English orthography, such as those of Geoffrey Sampson (1985) and more recently and thoroughly Des Ryan (2011) have provided accounts of the variety of functions a letter can fulfil within alphabetic writing systems, rather than simply judging orthographies as they exist as degenerate realisations of an ideal principle.

Beyond grammatology, the extra-linguistic meanings attributed to “visual” or “material” aspects of letters is of increasing concern – notably in growing field of *Linguistic Landscapes*, as well as the semiotics of typography (Van Leeuwen 2005; 2006). For the grammatologist letters are differential units of orthography; for the visual-semiotician or sociolinguist the letter is often a polysemous aggregate of connotations. The non-positive, differential account of the letter and discussion of the semiotics of the embodied letter have at times been presented as fundamentally at odds with one another (cf. Drucker 1994: 44; Seargant 2012: 188). It will here be argued that rather than these two positions contradicting one another, each describes the letter in a different semiotic context.

Nevertheless the primacy of the differential nature of the letter will be here asserted; yet at

the same time it will be argued that the differential letter is independent of language and orthography. Section five below provides a provisional sketch of a fundamental semiotics of the letter, underlying both the grammatological and visual-semiotic. By “fundamental semiotics of the letter” it is meant the semiotics of the letter prior to its exploitation in any particular sign-function or semiotic system. Regardless of any semiosis the letter enters into (be it within an orthography, a mathematical notation system, or in a *linguistic landscape*), the letter is in some sense, prior to any functional context, semiotic.

1. The immaterial controversy

The subject of this paper is the letters of the alphabet, yet this is not an investigation of the varieties of letters existing in history and the present. In discussion is the twenty-six or so letters of the modern European alphabet, derived from the Roman, used in various orthographies, notation systems and forms of graphic communication. When looked at orthographically, one could say that in each language that uses the alphabet, the letters (having special functions native to an orthography) are not the same (Crystal 1996: 292). However, my aim is to discuss the letter prior to its utilisation in a particular functional context. These twenty-six or so symbols have been developed into a set of components that can be used in a vast array of semiotic contexts.

Saussure (1974: 119–20) famously explained the non-positive nature of the phoneme by metaphorical reference to the letter <t>. Saussure provided three renderings of the letter and stated that they remain functionally identical whether rendered on a different surface or in a different manner. All that is necessary for a mark to function is recognition of its identity as <t> and recognition that it does not have another identity, such as <ɖ>, etc. That Saussure was not attempting to develop a theory of writing, but to explain the phoneme is frequently overlooked. Nevertheless, we can accept that Saussure did (albeit indirectly) assert a theory of the semiotics of the letter through use of this metaphor. Saussure’s simple statements about the letter – that its identity is not tethered to any particular graphic realisation; that its purpose is to be differentiated from other letters – does not imply that the *only* possible semiotic function a letter can have is non-positive and differential, he simply gave the subject no attention.

Van Leeuwen, who in the opposite manner to Saussure explains writing with reference to speech, writes

This view of the ‘distinctive’ role of speech sounds is quite similar to the view that letterforms have no meaning in themselves [...] In my view, however, distinctive features can become meaningful [...] The same reasoning can be applied to the distinctive features of letterforms (2005: 141).

Van Leeuwen is of course correct: an embodied speech segment, or letter, can enter into any number of semioses. Yet it is vital to note that sound or graphic qualities communicate in addition to, not in contradiction with, the differential role of the phoneme in a phonology, or the letter in an orthography. As Umberto Eco wrote

a sign-function is realised when two functives (expression and content [or signifier and signified]) enter in a mutual correlation; the same functive can also enter into another correlation, thus becoming a different functive and therefore giving rise to a new sign-func-

tion. Thus signs are the provisional result of coding rules which establish *transitory* correlations of elements, each of these elements being entitled to enter – under given coded circumstances – into another correlation and thus form a new sign (1976: 49).

That is to say, whether a letter is taken as a “purely negative and differential” unit – whether three renderings of the letter <ʈ> are taken to be functionally identical, as Saussure noted – or the three renderings provide independent meanings, depends upon what we are asking of the letter. Whether the three <ʈ>s are dispersed in a text whose linguistic content is being deciphered, or whether they are seen as indexical evidence of the presence of particular authors (or any other semiosis) is not fixed. As expression functive substance the graphic mark is not obligated to any content.

Nevertheless all things are not equal. There is a fallacy in arguments that suggest that recognition of meaningful differences in rendering of letters contradicts the Saussurean point that letters are first of all differential units independent of any substantial realisation. As will be elaborated below, the fallacy lies in the fact that recognition of “visual”/“material” significance is dependent upon a prior recognition of the differential and non-material nature of the letter. It is only when a letter’s identity is recognised, that a particular embodiment can be taken as meaningful.

2. Potestas

David Abercrombie (1949: 59) defined the three attributes of the letter in classical grammar as follows – “*figura* was the letter as written, *potestas* as pronounced, and by its *nomen* it could be identified for discussion”. Although Abercrombie was concerned with the letter within orthography, this paper uses expanded definitions of these three attributes to discuss the fundamental semiotics of the letter.

If we begin by thinking about the semiotic function of the letter within alphabetic orthography, as noted above, the letter is often supposed to function according to the alphabetic principle: a letter’s *potestas* should be one sound, and one alone. Yet, that the alphabet was most likely invented (or developed) as a set of symbols standing for individual segments, does not explain the synchronic function of letters in actually existing orthographies.

As we know, the alphabetic principle does not account for English orthography. A very simple example: the letter <c> frequently stands for [s] and [k], sounds also indicated by <s> and <k>. In other contexts <c> can indicate [ʃ] as in <precious>. And so on. English orthography cannot be explained as having a few anomalous deviations from the alphabetic principle. Even if one were to map all the possible sounds a letter or letter combinations refer to, this would still fail to explain the function of letters within English orthography. Even those orthographies which are said to be highly alphabetic, such as Finnish, depart from the alphabetic principle in their use of upper and lowercase letters as differences in symbols occur for reasons other than differences in sound. Often letters make visual distinctions which the spoken language fails to represent. It has been demonstrated by Sampson (1985: 203–204), that English orthography has tendencies towards logography, as letters combine not simply to stand for sounds but to form word symbols (logographs) allowing graphic distinction for homophones such as the various meanings and spellings for [raʔt]. Ryan has examined aspects of writing normally considered to fall outside of the English writing system, including constructed homophony (a form of non-standard spelling) (2011), and the use characters intentionally rendered to have more than one reading (2015). Ryan argues that these fringe activities serve to demonstrate the interaction of phonetic and graphic functions of letters in writing. There have also been numerous sociolinguistic studies

into the role of non-standard orthography (or transgression of “highly-regulated” orthography) in the construction of cultural identity (Sebba 2012).

We need not go through this in further detail. It suffices to say that even within “standard” orthography the roles which letters play are varied and not yet fully understood. We can therefore expand Abercrombie’s sense of potestas from “sound” to any use to which the letter is put in a given system. Rather than thinking of a letter as relating to a particular sound in a given language, a letter is better thought of as a component used in writing; a component which we can put to various uses. The same components are used in various orthographies, in which they may have similar or entirely different functions. We can expand the meaning of potestas further, beyond the linguistic-orthographic, as letters can be, and in fact are, used in numerous notation systems, such as algebra and symbolic logic. Therefore the potestas belongs to a system but the letter does not. In a structural sense, the letter pre-exists the potestas which it is given.

The second definition for “letter” provided in Florian Coulmas’ (1996: 292) *Blackwell Encyclopedia of Writing Systems*, is a function-based definition of letter as “a graphic symbol that represents one or more phonemes of a language [...] defined in terms of its function within a system that represents speech”. The potestas is the letter as it functions in a system. Although the system need not be orthographic-linguistic, we can (akin to Saussure and van Leeuwen), explain potestas with reference to the phoneme. In a phonology a phoneme is not defined by its positive phonetic substance, but according to its non-positive and differential nature. The term “grapheme”, in analogy with “phoneme”, has been used to describe the non-positive and differential nature of letters within orthographies (Vachek 1966). Others, notably Peter Daniels (1991), have rejected the term grapheme as theoretically imprecise.

There are several reasons why the term “grapheme” is here avoided. Firstly Daniels’ critique is valid: it seems inappropriate to apply a common term to such divergent writing systems as Chinese and English. Even within alphabetic orthographies there are difficulties with the term (cf. opposing views on whether upper and lowercase letters constitute independent graphemes in Crystal 2008: 220; and Sampson 1985: 25). More directly relevant, it is necessary here to assert that the letter is differential regardless of particular linguistic-orthographic contexts. “Grapheme” is a term used to describe a letter attributed with a particular non-positive differential role. But that to which is given a graphemic function – the letter itself – is already non-positive and differential.

As Sampson (1986: 20, 25) notes, a blackletter character and its roman type equivalent can be considered to be functionally identical despite differences in style. *The Complete Works of Shakespeare*, whether printed in blackletter or roman, involves functionally identical strings of letters: a sonnet read from either book would be the same sonnet. Within this specific semiotic context the visual difference would be functionally irrelevant. Another example is the 1916 Proclamation of the Irish Republic which famously was printed in such haste that more than one typeface was used in the body of the text. The switches in typeface are orthographically irrelevant (however, their orthographic irrelevance does not preclude other semioses, as the presence of variations in character style is a necessary index of an authentic copy).

But there are notation systems which rely on letters in a similar manner to linguistic orthographies, as differential units, in which differences in typeface style is of vital importance. In the mathematical notation shown in figure one, blackletter and roman characters have been assigned precise potestates such that if the character set in blackletter were set in roman the equation would cease to make sense. This greater precision in differentiation does not mean the letters now function owing to graphic substance, or due to their “materiality”. What matters is that a distinct potestas has been applied not only to letters (e.g. <a> ?) but to the particular style of the letters (e.g. <a> ? <ā>).

It might be argued that mathematical notation is irrelevant: that it just so happens that letters are used when any other set of symbols would do. Such an argument would prioritise the letter's historical role as indicator of sound and ignore its synchronic existence. Letters are graphic components used in various sorts of notation and are not tethered to the denotation of sound, nor linguistic use. Letters are symbols that have been developed into a uniquely vast inventory of stylistic variations that can be rendered with a great many technologies (from pencil to specialist software LaTeX) and can be recognised with even greater rapidity and ease. Letters certainly do not construct mathematical meaning (they are arbitrary), but they are the best materials available.

That the letter is not tethered to sound can be clarified with reference to Saussure's explanation of linguistic identity through the metaphor of the 8.25am Geneva to Paris train. Regardless of whether the train is composed of new carriages and passengers each day, we recognise that it is the same train each day owing to its being functionally identical (Saussure 1974: 108). We need to reverse this metaphor to understand the letter. To prioritise the letters linguistic function over all others is akin to calling a car that once carried passengers to the capital of France, "to Paris". The letter has an identity prior to any of its functions.

3. Figura

If the letter is not defined according to a particular potestas, but is rather that to which a potestas is given, must it be defined as *figura* – as shape?

As already discussed letters come in different shapes, and we have seen that sometimes these different shapes are given precise potestas (as in the mathematical notation), and sometimes variations in letter style will not carry such a precisely defined function (as in the Proclamation of the Irish Republic). In each of the tens of thousands of typefaces available the letters are designed slightly differently. The letters will further be rendered differently depending upon the quality of printing or digital display they are realised through. And each person's handwriting will render letters differently again. Yet, we recognise such variations not as unique symbols but as different renderings of the same letters. This identity is independent of attributed *potestas*: the mathematical notation supplies potestas to different versions of *the same letter*, and the Proclamation does not.

On the book cover shown in figure two there are two styles of letter. The letter ⟨a⟩ in ⟨graphics handbook⟩ and in ⟨Ken Garland⟩ is orthographically identical. Yet clearly the shapes are communicatively different. It is not my purpose to develop an analysis of the visual semiotics involved here, but let us say for the sake of demonstration that the author's name being set in a sans-serif connotes matter-of-factness, and the title lettering being composed of a modular units is iconic of the modernist approach to graphic design which the book endorses. Such semiotics of the letter can be referred to as the *connotative* or *semantic* values associated with letterforms. Whatever the meaningful difference between the styles, this connotative semiotics of the letter is not of the same nature as the differences in letter style in the mathematical notation example. In the mathematical notation a precisely and unambiguously defined difference in potestas is applied to the letter styles and on the book cover it is not. Nevertheless, the following point is both fundamental and crucial: just as in the orthographic context the recognition of (connotative/semantic) meaningful differences in the styling of letters on the book cover is completely dependent firstly on recognition of the two differently-styled shapes sharing, in an abstract sense, the same identity. The different meanings attributed to each letter ⟨a⟩ must follow recognition that both are in fact ⟨a⟩: both belong to the same abstract conventional category, and it is the differences in realisation of this identical abstraction that allows semantic/connotative meaning to enter.

4. Nomen

Ultimately, if a letter is neither function (potestas) nor shape (figura), the letter is to be understood as *nomen*. Here *nomen* does not mean literally “name”, as name varies across languages, but the associative category to which the letter belongs. This is Charles S. Peirce’s *symbol* at its fullest degree of abstraction – its meaning conventionally established independent of particular instances of its occurrence. Peirce’s explanation of the symbol with written and spoken words as examples applies equally to the letter:

[the symbol is] itself a kind and not a single thing. You can write down the word ‘star’, but that does not make you creator of the word, nor if you erase it have you destroyed the word. The word lives in the minds of those who use it (1931–58: 169).

And,

we speak of writing or pronouncing the word ‘man’; but it is only a *replica*, or embodiment of the word, that is pronounced or written. The word itself has no existence although it has a real being, *consisting* in the fact that existents *will* conform to it (1931–58: 165–66).

Likewise, the embodied letter regardless of the peculiarity of its embodiment is a token of a non-embodied abstraction. This definition of the letter as *nomen* is similar to the first definition of letter supplied by Coulmas in his encyclopaedia of writing systems:

[a letter is] one of a class of shapes which are recognized as instances of abstract graphic concepts which represent the basic units of an alphabetic writing system. Each of these units has a name, for example ei, si, kei. Thus the letter em is the class of all Ms no matter how they are shaped; more precisely, it is the class of all conceivable letter shapes to which the name em applies (1996: 292).

To this we must, however, add several qualifications. Firstly, as already noted, letters are not united under a “name” tethered to a specific phonetic/orthographic realisation such as “em”, but are held in a general category here called a *nomen*. More importantly, the “alphabetic writing system” to which a letter belongs need not be linguistic-orthographic. Finally the definition of letter as an associative category uniting various shapes is not one definition of the letter sitting next to the Coulmas’ orthographic definition (see section two above), but structurally must precede the exploitation of the letter with attributed potestas in a given orthography or other system.

5. Paradigm figura

Coulmas (1996: 292) notes that regarding the variety of shapes held to be the same letter, “it is difficult, if not impossible, to define these prototypes in terms of invariant graphical features”. Coulmas is correct that a definitive inventory of the shapes united under a *nomen* cannot be provided. However we can, with the aid of a metaphor of Peirce’s, shed some light on how it is

that certain tokens are united under the same nomen.

Between the pure abstraction of the symbol and its particular substantial realisation as token, there are what are here called *paradigm figura*. On the one hand, these paradigm figura are what particular letter tokens approximate, and at the same time, the paradigm figura result from a generalisation of all prior letter tokens. When the typeface designer opens FontLab, or when we lift a pen, we approximate a particular paradigm figura. At the same time, the sum of such approximations leads to a continual morphing of the paradigm itself.

Peirce's metaphor of the composite photograph is here relevant. The composite photograph was a nineteenth-century technique in which photographic portraits were overlaid in an attempt to determine human types. Despite the scientifically dubious nature of this practice, Peirce found it useful in metaphorically describing the nature of certain concepts. The idea of 'yellow' is not held mentally as a specific light-wave frequency, but rather as an approximation based on previously experienced yellows (Hookway 2002: 29). Likewise, when we think of an object such as a 'chair' we conceive of a mental composite image of previously encountered chairs, the overlay of which forms the general idea of chair. In a similar way we can think of paradigm figura of letters not as precisely defined schemas, but as soft-edged composite images.

The uppercase ⟨A⟩ in most roman typefaces and non-cursive handwriting adheres approximately to the following structure: two lines descend diagonally left and right from an apex, linked by a horizontal line. An inscribed letter that adheres to these rules is a *token* of this paradigm figura. That a serifed ⟨A⟩ has 'feet' and a bold sans-serif ⟨A⟩ has a flat rather than pointed apex are the details with softer edges in the composite image of the paradigm: their presence or absence does not inhibit recognition of the figura.

The symbol is entirely abstract. All that the symbol demands of its paradigm figura is that they are agreed to be, by convention, paradigm figura of the symbol. The paradigm figura is also abstract in that it is independent of any substantial realisation. However, unlike the relationship of symbol to paradigm, the relationship of token to paradigm figura does demand that certain attributes be approximated. In Eco's terms (1976: 184), the type/token ratio is one of *ratio facilis* meaning that for the token only "some features are pertinent and some others are variable and inessential for the isolation of the given-unit".

It is overly simplistic to imagine that letter-tokens are independent realisations of paradigm figura: letter-tokens are most often realised as members of alphabets – typeface or lettering styles. These alphabets themselves impose constraints and conventions on how the token realises the paradigm. In a sans-serif alphabet – such as that of Helvetica – every stroke will most likely be in reference to a paradigm figura. In contrast, in a script typeface some strokes will be flourishes that do not relate to a paradigmatic form but to the typefaces own native stylistic conventions. In essence each alphabet establishes *native coding conventions* determining how the letter-tokens fulfil paradigms. Such native coding conventions are unique to each alphabet, but they are not entirely freely invented, as native coding conventions are themselves often governed by more general conventions – which we can call *paradigm coding conventions*.

Returning to figure two, ⟨graphics handbook⟩ is rendered in a modernist modular style. Such alphabets are constructed with a minimum of possibilities – all letters the same width, all strokes the same thickness, all curves perfect circle arcs, etc. Thus the design method forces the letters to depart from paradigm figura due to adherence to native coding conventions at the expense of paradigm coding conventions.

In contrast, a more conventional printed alphabet, such as that found in the typeface Times New Roman, is governed by conventions not only found in Times. Certain strokes are heavier than others – it is "stressed" – and serifs of a particular style occur at particular points. The placing of serifs and stress are more or less the same as many other roman typefaces. In that

sense they follow a paradigmatic sets of coding conventions. But what makes Times Times is the subtleties in the exact application of the coding conventions. It is in this sense that they are “native” to Times. Further native conventions determine, among many other things, the relative proportions of the letters – in the case of Times there is a large x-height and short ascenders and descenders – and equally all exceptional “conventions” which may have only one application.

Conclusion

Letters pre-exist – structurally if not historically – the systems (or contexts) that supply them with functions. Nevertheless, letters are not semiotically neutral prior to their exploitation in particular semiotic systems. Letters have been developed into a uniquely vast range of styles that can be rendered and recognised with ease in an array of functional contexts. What allows this is recognition of the letter as nomen – it is only when the identity of letters is recognised that visual similarities and differences can become meaningful. Saussure was more or less correct in his description of the letter as non-positive and differential, but this applies to letters more broadly, not just within alphabetic orthographies. Whether <ɋ> looks like any of his three examples is not at first important, as long as each is recognised as <ɋ>. It is only after this recognition of identity that the visual semiotician can note differences in renderings of <ɋ>, and thus detect a specific content.

The semiotic richness of the letter resides in the fact that prior to its exploitation in a particular sign-function or semiotic system, there are several stages to its realisation, and at each of which a precise potestas can be applied, or a visual-semiotic distinction can be made. This is the fundamental semiotics of the letter, which underlies the use of letters in any particular semiotic context. In standard orthographies the potestas is applied at the level of symbol. As we have seen, in certain forms of mathematical notation, different paradigm figura of a symbol (themselves governed by paradigm coding conventions) can be supplied with potestates creating a greater degree of differentiation than is found in standard orthographies. The example of the Proclamation of the Irish Republic demonstrates that this richness is also at work in semiotic contexts not governed by strict potestates. Orthographically all the symbols that are realised as differently styled tokens on the Proclamation have the same potestas. However, because the symbols have slight differences in their approximation of paradigm figura, the tokens are then able to serve as indices of the authenticity of the document.

TOWARDS A QUANTITATIVE VISUAL SEMIOTICS?

Yannis Skarpelos
Panteion University, Athens, Greece
gskarp@panteion.gr

Abstract

Visual Semiotics, as is the case with most of Visual Studies so far, have not found yet a sound and methodologically rigorous equilibrium between ‘visual’ and ‘semiotics’. Instead, following existing examples, they scrutinize visuality, the gaze and other similar objects of inquiry, or work on visual grammar and syntax. In all cases, they deal mostly with meta-language about images than with images themselves. They deal mostly with words used to describe the visual (either produced by the researcher or by others) than with the visual itself.

In this paper, I am to propose the use of existing software tools in order to achieve research in quantifiable signifiers in visual images, and their manipulation towards a quantitative semiotics. Concepts like ‘entropy’, ‘hue’, ‘saturation’, ‘mean RGB’ etc. are the computed signifiers which are actually visible but so far visual researchers were unable to tap upon. Illustration of the method will be provided by my current research.

1. Introduction

Decade after decade, the number of photos produced per year is multiplied, reaching the incredible amount of 380 billion in 2012. According to Schwartz (2012) 3.8 trillion photos had been taken from the invention of the camera till 2012. This number is amazing (though it may be a mere guess), and still leaves beyond contemplation video and all forms of “moving” images, as well as multimedia products, software interfaces, computer games, to name but a few types of modern visual data. Almost two centuries since the invention of camera, five centuries of print images, millennia of hand-drawn pictures, and two decades of digital media, the visual realm is now vast enough to be considered under the name of big data.

On the other hand, it looks like visual semiotics is more comfortable with less data. Actually, one or few images are considered enough. Half a century after the famous essay by Roland Barthes, “Rhetoric of the Image”, we still “start by making it considerably easier for ourselves” (Barthes 1977: 33). We are thus replicating, more or less, what is already known, at least methodologically. But the advent of big visual data readily available, combined with the epistemological shift in Digital Humanities, plus the opportunity to use software appropriate for the analysis of visual images, compose a new framework for the exercise of visual semiotics –namely, a quantitative visual semiotics.

In the following paragraphs I will take as an example the semiotic analysis of music album covers, to demonstrate a still highly experimental approach to such a version of semiotics. My approach takes into account, as a distant precursor, the work of Groupe μ in *Traité du signe visuel* (1992).

2. The analysis of music album covers

Man, if you want to see where the world's been,
just look through some old album covers
Patty Smith

Jones and Sorger remind the reader that “when Johnny Rotten of the Sex Pistols proclaimed, ‘if people bought the records for the music, this thing would have died a death long ago’, he illustrated the importance and power people place on ‘the look of music’” (Jones and Sorger 1999: 68). As Toivanen points out: “The album cover art is an essential part of the vinyl record use experience. The record is not just for listening, but to be held and looked at, as well. ‘The artwork is a continuation to the soundscape of the album’” (Toivanen 2014: 34).

Music disc covers of any format (vinyl or CD) are cultural artifacts of a specific status. As cultural artifacts, “images converge into a single scope: That of transmitting old ideas in order to awaken new perceptions and the desire to consume” (Fiore and Contani 2014: 40). While, as Patti Smith said once: “Man, if you want to see where the world's been, just look through some old album covers” (quoted in Jones and Sorger 1999: 70). Existing literature on album artwork (cf. Robertson 2007; Bestley 2014; Blue 2011; Grant 2001; Jones and Sorger 1999) shows that it is connected to the cultural and political values of the social environment within which they were produced and consumed (Chapman 2012; Lowey and Prince 2014; Shaw 2014; Hickam and Wallach 2011; Karjalainen and Ainamo 2011; Karjalainen, Laaksonen, and Ainamo 2009; Alleyne 2014; Inglis 2001), or even the global environment of the last two decades with its globalizing impact on both visuals and values.

Album art has been connected to LP and its large 12-inch format (Jones and Sorger 1999: 70; Bartmanski and Woodward 2013: 7), so that its replacement with the much smaller CD cover “has led many to lament the decline, even the disappearance of album art” (Inglis 2001: 83). It is intriguing to find that more than a decade later, despite the familiarity of music CDs, the same stance is held (Toivanen 2014: 39).

Androutsopoulos and Scholz suggest that:

Every vinyl or CD record is a semiotically complex textual unit. It consists of the sound material of the CD itself and the verbal and visual material of the CD cover and booklet, which includes pictures, acknowledgments, and various promotional texts. While record cover and booklet are certainly peripheral in terms of artistic value, they are nevertheless quite important for the self-presentation of the artists. (Androutsopoulos and Scholz 2003: 469; cf. Fiore and Contani 2014: 38)

Album covers are multifunctional visual cultural artifacts, since they:

- “Ensure the protection of the recording they contain” (Inglis 2001: 83; Jones and Sorger 1999: 68).
- They serve as an advertisement (Jones and Sorger 1999: 68). They or their artwork are used in posters, digital or print advertisements. In being a sort of advertisement by themselves, “they reflect the conventions of other media forms, notably the news headline and/or lead, which act as an enticement to the reader to continue reading; and the magazine advertisement or television commercial, which similarly seek to attract and retain the consumer’s attention” (Inglis 2001: 84).
- They are “an accompaniment to the music (...) an integral component of the listening which assists and expands the musical experience” (Inglis 2001: 84). Inglis mentions that the listener may wish to refer to the artwork of the cover during listening to the music, or even read or sing the lyrics provided in the sleeve. There are other ways in *accompaniment* as well: the artwork may represent the ‘myth’ or the ‘mythological narrative of those involved in the production of the music (the composer, the songwriter, the singer, the band etc.), participating in the production or reproduction of their identity. As Tuomas Holopainen said, with the visual design “we try to create our own Nightwish universe, imagination land, own Nightwish mythology” (quoted in Karjalainen and Ainamo 2011: 31). Another good example offers the “non-representational and abstract album artwork” of Autechre, that complements their secrecy and mystification of their way of doing music (Brett 2015: 9). Another way to put this connection between cover artwork and the music in a larger totality, is the work of artists and studios like Hipgnosis, the studio “effectively translating sonic experiences into still images and accelerating the rock album cover’s development” (Alleyne 2014: 251). Finally, and against the grain of most of mainstream rock covers, the punk covers, “lowbrow, offensive, and easily reproducible on a limited budget” (Acock 2014), duplicate the ideological premises and visualize the cultural directions of punk.
- It is a way to engrave the authority of the ‘label’ (the company) upon its products, inscribing visual elements of its brand on it. According to Pat Dolan in 1940s, “each album should reflect the quality of the Columbia name” (Schmitz in Jones and Sorger 1999: 72).
- The cover has an aesthetic value. “The LP format’s material packaging is relevant for understanding its reported aura” (Bartmanski and Woodward 2013: 6). For example, Inglis mentions that the Beatles’ “album covers themselves have been seen as groundbreaking in their visual and aesthetic properties, have been congratulated for their innovative and imaginative designs, have been credited with providing an early impetus for the expansion of the graphic design industry into the imagery of popular music” (Inglis 2001: 83).
- The cover is a way to approach and experience the work of music. “Cover designs depict what the product means, not what it physically is” (Alleyne 2014: 252), and thus it offers a key to its interpretation by the audience, even if this is not an ‘open’ work. On the other hand, in Brazilian hip-hop the meaning resides in an “attitude” which “is essentially linked to the representation of ‘reality’ and more specifically working-class daily life in Brazil’s impoverished suburbs” (Pardue 2005: 61), and this representation happens visually on the cd covers. According to Pardue, “Hip-hoppers implicitly make correlations between the technologies of image manipulation that comprise the appearance of the CDs and their perspectives on ‘reality’” (Pardue 2005: 62; cf. Pardue 2010: 50). The same holds for the metal scene: “An essential part of the attraction of metal music is not only how it sounds but also how metal looks. Album covers, dressing, stage constructions, posing in photos, facial expression, postures, spectacular shock effects, and small details telling about the extremely precise aesthetics of the sub-culture constitute the visual code system of metal” (Karjalainen and Ainamo 2011: 31).

- “There is an important sense in which an album sleeve can be seen as a commodity in its own right” (Inglis 2001: 84). As such, the cover is a collectible cultural artifact, like many other mass culture products like posters, or photographs (cf. Fullerton and Rarey 2012). Jones and Sorger realize that “LP album covers have not yet lost their cultural status for designers and consumers alike” (Jones and Sorger 1999: 70).
- The cover is a means of communication between the artist(s), the illustrator/designer, and the fan base. In this function, Fiore and Contani indicate that heavy metal album designers utilize “excessively strong images (...); to this end they need the grotesque as a leitmotif for an efficient dialog among all the factors in play” (Fiore and Contani 2014: 39). The authors follow Goulart and suggest that “It is (...) the images and illustrations that the authors (or artists) direct in the function of interlocutor to the social audience or consumer market of heavy metal recordings, t-shirts and videos” (Fiore and Contani 2014: 40).
- The cover is a means of visualizing identity, not only of the artist(s) or band, but also of a sought identity (be it a group, ethnic or local identity) (cf. Weston 2011).
- Finally, the cover artwork may become a sign of fandom, as exemplified in its social media use, or in mashup videos in Youtube.

Album covers are conceived as “visual signposts” of their era (Evans in Inglis 2001: 85). They allow for “a textual analysis yielding rich insights into the ways in which they invite or allow the consumer to decipher them” (Inglis 2001: 85).

From a semiotic point of view “record covers [...] convey meaning through all of the semiotic resources of which they are composed: language, typography, images, and layout” (Androutsopoulos and Scholz 2003: 469), and they therefore require a multimodal analysis. Such an analysis requires a strict selection of one or a few covers, since it will either repeat itself or delve into minutiae without being able to provide the wider image. It is no surprising, then, that Androutsopoulos and Scholz analyze only one cover, as “a particularly suitable example” (Androutsopoulos and Scholz 2003: 469); Inglis analyzes only 12 of the “hundreds, perhaps thousands, of Beatles album covers in existence” (Inglis 2001: 84); Shaw is limiting her analysis to four covers from a series of 51 CDs (Shaw 2014: 37–38). Androutsopoulos and Scholz declare: “this is by no means a representative cover for European rap records in general, it does provide an excellent illustration of how a ‘local’ instantiation of the ‘global’ genre is visually encoded” (Androutsopoulos and Scholz 2003: 470). It is clear then, that the selection is not based upon any idea of sampling. It is rather based upon the scholar’s convenience.

3. Methodology

In my research, the focus is cultural dynamics. In short, I am interested in the way cultural artifacts incorporate signs of cultural trends, values, ideas related to a dynamic and changing environment. I am also interested in the ways such artifacts change in time according to this changing environment. Instead of analyzing some dozens of visual images, I attempt to look at 24,066 images covering a certain area of cultural production during half a century. I use as my sample the cover artwork of all the albums produced in Greece since 1960. Existing bibliography (Dragoumanos 2007) shows a prolific production of approx. 28,000 albums. It is impossible to analyze such an amount of visual data the traditional way. Here, as Manovich put it, *software takes command* (2013).

Software can extract tens or even hundreds of measures for each image, which can then be analyzed in many ways. In the examples of this paper I used an open source program (ImageJ) as well as macros created by the Software Studies Initiative and distributed under a GNU license at their website.¹

¹ <http://lab.softwarestudies.com/>

Existing software allows, for example, measuring entropy. For software mechanics entropy “is a measure of the degree of randomness in the image” (Thum 1984: 203), “an intuitive understanding of information entropy relates to the amount of uncertainty about an event associated with a given probability distribution. The entropy can serve as a measure of ‘disorder’. As the level of disorder rises, entropy increases and events are less predictable” (Sonka, Hlavac, and Boyle 2008: 25). Thus, “the higher the entropy, the more complex the image” (Marques 2011: 466).

On a more semiotic ground, the balance between order and fragmentation (i.e. entropy) “is about the degree of coherence of the world” (Groupe μ 1992: 35). On the other hand, it is clear that the meaning of entropy in our software is quite different from the teleological use of it by Arnheim (1971), and criticized by Groupe μ . We could expect that when the “coherence of the world” is less valued, when the world appears to be incoherent or fragmented, when personality is more important than collectivity, then visual representations would be more entropic. So, as our society proceeds towards postmodernism, we should expect visual cultural representations to become more entropic.

On a sociological level, this would be compatible with R. Inglehart’s findings that Western societies moved from materialist towards postmaterialist values, as more generations have “spent [their] formative years in conditions of economic and physical security” (Inglehart and Flanagan 1987: 1296; cf. Inglehart 1977; Inglehart 1981; Abramson and Inglehart 1992; Inglehart and Abramson, 1999). Changing values “are reshaping religious beliefs, job motivations, fertility rates, gender roles, and sexual norms and are bringing growing mass demands for democratic institutions and more responsive elite behavior” (Inglehart and Welzel 2005: 15). With the shift to postindustrialism, the values that gain salience are those connected to “self-expression (...), through which people place increasing emphasis on human choice, autonomy and creativity”, and self-expression (Inglehart and Welzel 2005: 20–21). Are they also affecting the structure of our visual cultural artifacts towards a certain direction? And since the analysis of such a huge amount of images renders it impossible to analyze them at the figurative level, is it possible to trace such changes beyond the figurative level to the plastic (abstract) level?

4. Discussion

One could visualize entropy by comparing one of the most entropic with the least entropic album cover artworks in my sample. A reference to the cultural context of their publication can induce the meaning of the two covers:

Image 1. D. Savvopoulos, “To Perivoli tou Trelou” [A Fool’s Garden] (1969).
This album cover’s entropy is 7.59279.

The first cover (image 1) comes from the late sixties (1969). One could suggest that entropy was the cultural mood of the era: hippie culture, weed, Rock, Vietnam, peace movements, May 1968; a world in constant motion, turbulence and unrest. What is more: this unrest was in a strict contradiction with domestic rule – the military dictatorship imposed in April 1967. Thus, beyond the visual signs (and maybe, even, as a clue to their “deciphering”), entropy could be a second order sign, signifying sympathy with youth movements throughout the West that could be overlooked by the censorship mechanism.

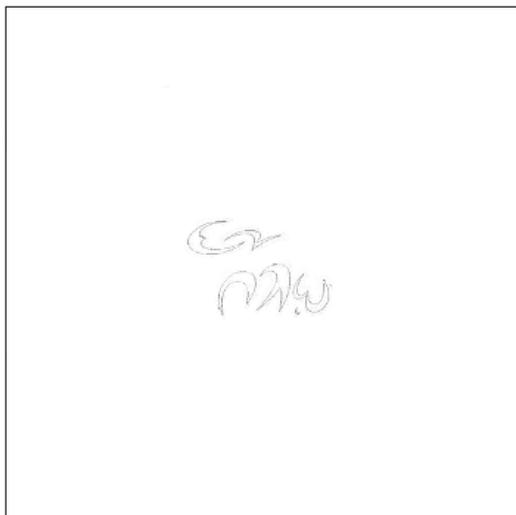

Image 2. En Plo, “En Plo” [On Board] (1989).
This album cover’s entropy is 0.218448.

The second cover (image 2) comes from the late eighties (1989). It is the cover of the only album by an alternative, underground group. I think that the intertextual reference to *The Beatles* so-called ‘white album’ is quite strong, not only because of their perceived similarity (actually, the latter has even less entropy than the former), but also because of their ironic connotations. Produced at a period when the expectations of a whole decade seemed to vapor among political scandals, together with a complete change of the prevailing socio-cultural and economic values, the purity of the cover seems at once impossible, romantic and utopic.

One should mention, though, that this example shows that even if we expect visual cultural representations to become more entropic, the correlation between entropy and time is not linear.

The difference in entropy between the two covers is evident without need to use any instrument but the eye. What happens when the researcher is confronted with a huge number of images, with slight differences between them – something like ‘the 24,066 shades of grey’? In that case, the quantitative approach seems unavoidable. From a sociological viewpoint, one could manipulate numerical data, proceeding towards a sort of quantitative visual semiotics, which I will now try to showcase. But will it still be ‘semiotics’?

First of all, new types of visualizing a kind of sign available for quantitative manipulation are possible. For example, we can follow the fluctuations of entropy on the album covers from 1960 to 2010 as an expression of cultural dynamics (fig. 1).²

² The first four years of the period examined here are represented with only 12 covers, which makes impossible to make any valid observation for them.

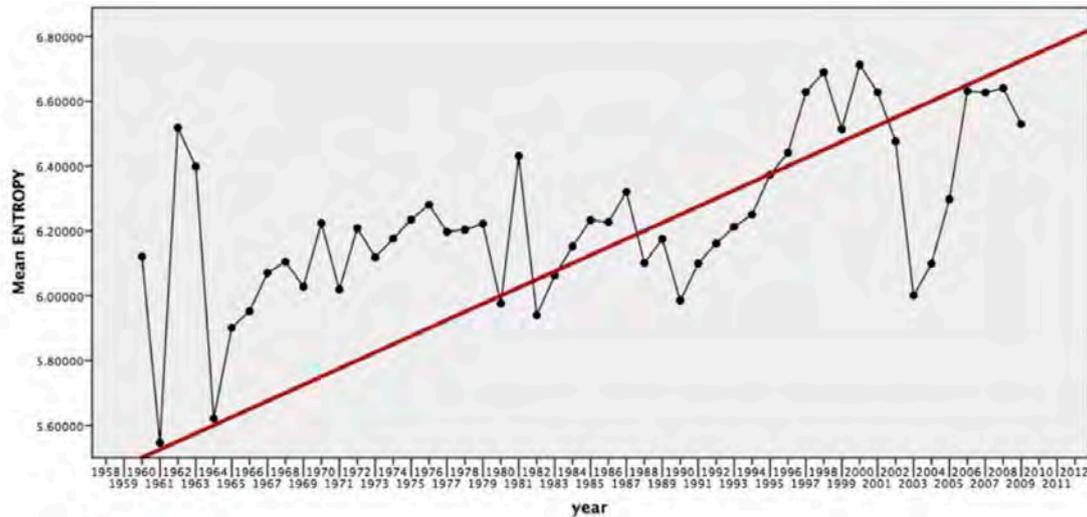

Fig. 1. Mean entropy on the album covers' artwork per year (1960–2010).

In figure 1 one may observe that there is a trend towards an increase in entropy, which might have been expected if we mechanically transfer the second law of thermodynamics into cultural systems. But, as Arnheim has noted (1971), we should not take the law as a universal constant and use it in cultural artifacts. What is evident in this diagram is that the mean entropy of all albums' artwork shows an interesting pattern, with micro-trends in periods of stability, fluctuations in periods of crisis, sudden turns to a different direction, and so on.

There is fluctuation in the period of military dictatorship (1967–1974); a sudden but short term fluctuation with no direction at the beginning of the 1980s, when Greece turned from a long period of rule of the political Right to a socialist government with strong leftist overtones; a decrease in entropy during the second half of the 1980s, when the cultural values began to change due to the incorporation into European Union, but also to an economic crisis and austerity measures, followed by political scandals and unstable short-lived governments; a steady increase during the 1990s, when a new modernizing effort was undertaken; a sunk during a legitimacy crisis in the early 2000s, followed by an increase after the 2004 Athens Olympics; and a stabilization the years before the current economic, political and cultural crisis, which is not represented in my sample.

What may be inferred from such a reading is that “entropy”, as well as other similar measures seem to be related to the cultural, political and social environment within which they are encoded and decoded. There may be no single referent (or signified) for such kind of signs, but they still deliver a message.

Though entropy in visual messages may relate to socio-cultural reality, it is hard to find data for long periods spanning half a century. I experimented co-relating entropy dynamics to changes in socio-cultural indicators. For instance, I compare entropy with Gross Domestic Product.³ As is clear in this figure 2, the GDP rise follows the entropy trend, though no evident relationship with short-term fluctuations is found.

³ The GDP data were obtained from the *Index Mundi* website (<http://www.indexmundi.com/facts/greece/gdp>)

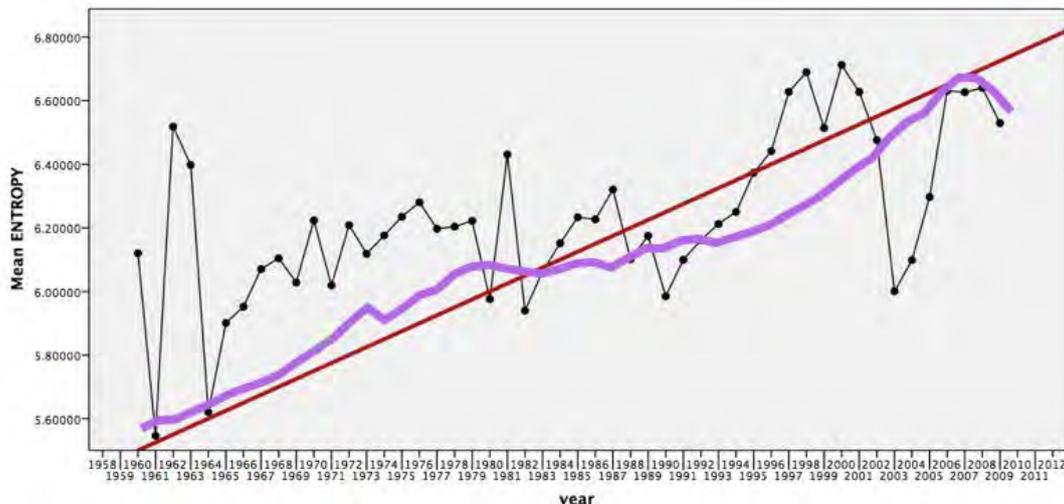

Fig. 2. Mean entropy of album covers' artwork compared to GDP in constant 2000 USD (1960–2010)

In fig. 3 I compare entropy with inflation rate.⁴ There appears to be a tendency for a rise in entropy in periods of low inflation rates, which is compatible with our hypothesis: low inflation rates mean economic security, hence the opportunity to pursue personal goals, and promote individualism vis-à-vis society. In any case, the lack of longitudinal data for the whole period don't allow for a definite thesis on the connection between visual entropy in cultural artifacts and post-materialist or mixed values.⁵

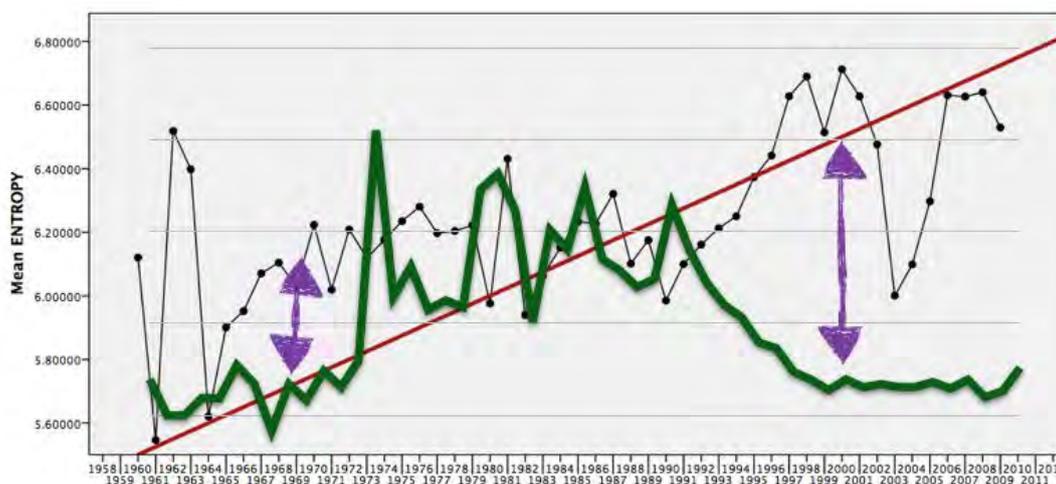

Fig. 3. Mean entropy of album covers' artwork compared to inflation rate (1960-2010)

⁴ Inflation rate data were obtained from the *Trading Economics* website (<http://www.tradingeconomics.com/greece/inflation-cpi>)

⁵ Eurobarometer studies offer a time-series from 1980 (when Greece was accepted in European Union) until 1995 (Schmitt et al. 2008). After 1995 the materialism/postmaterialism questions were asked only sporadically.

5. Conclusion

Music albums' cover artwork is an intriguing cultural and communicational artifact, similar to advertisements as well as all other forms of mass images, appropriate for semiotic research. Album covers are available in digital form, since they are collectible by themselves, as well as since they form part of the metadata used for the digital promotion and sale of music. The digitized covers available to visual researchers are, therefore, much more than any semiotician could hope to see – and hence to analyze. It is exactly this amount of available data that calls upon us to face new challenges in socio-semiotics, cultural semiotics, as well as the semiotics of cultural change.

Our semiotic traditions, used to the analysis of exemplar items rather than huge collections, are not helpful enough to answer such challenges. In this paper I have proposed the search for signs that may be discerned through computer software and be abstractly presented in quantitative terms. These signs have certain communalities with the ones suggested by Groupe μ for the analysis of plastic (non figurative) signs: entropy; mean values for red, green and blue; hue vs. saturation. Actually, taking the first steps in the realm of big visual data, the distinction between iconic and plastic signs is losing importance, while the available toolset allows for the transition from the concrete forms to the abstract quantitative signs.

With the example used in this paper, I have shown that such an approach is possible; that it may be further visualized; and that it allows – *inter alia* – the understanding of the temporal dynamics of visual signs, as well as its co-relation with cultural and social variables.

To be sure, this attempt is still highly experimental, and there is a need for further experimentation with other measures beyond entropy, in order to fully grasp the possibilities of a quantitative visual semiotics.

anna.zapiti@gmail.com

Abstract

Political advertising as a communication process aims in attracting the viewers' attention towards what a candidate or a party has to say with the 'intention of influencing their political attitudes, beliefs and/or behaviors' (Kaid, 2004). In electoral photography the candidate does not only attempt to establish a program with the voters but also a 'personal link' with them, articulated through 'a style of life of which he is at once the product, the example and the bait', heroized through the iconography of his appearance in familiar social settings, gestures and other predetermined set ups (Barthes, 1993). As Capistran (2013) argued, the posed, constructed and photographic image of the candidate in the studio or another controlled environment indicates the power of control by the individual represented. Dumitrescu (2010) identified two communication roles that political posters play; the first is to provide "factual" information about the candidates whilst the second is to present "nonverbal" information through pictures of the candidate, signaling behavioral intent. Political posters can also significantly alter their motivational and persuasive power simply by using images that elicit emotions such as fear or enthusiasm (Brader, 2005). Different feelings and preferences can be elicited through the image of the candidate alone.

The purpose of this study is three-fold: to examine which non-verbal attributes/connotative mechanisms are used by candidates in the construction of their political image; to investigate the linguistic meaning of headlines—isolated and in respect of the candidate's image; and to explore the semiotic characteristics of the typography used in the main headlines. One hundred

and forty seven (n=147) political posters were taken for analysis. These posters came from presidential and parliamentary elections from the 1960s until 2013 in Cyprus. All posters include an image of the candidate. The posters were drawn from the Press and Information Office (PIO) in Cyprus, the archives of different newspapers and magazines and from various advertising agencies that have dealt with these posters. The methodology of content analysis was used and the coding frame developed was based on previous published work.

The data revealed that there are changes in the connotation procedures on the photographic messages of the political candidates as well as in the linguistic meaning and the typography of the headlines used. The study shows that political images, linguistic messages and typography of headlines vary over a period of time and suggest that there are associations of these changes with socio-historical landmarks and events.

1. Introduction

Political posters have a long contribution in the history of political campaigns. Seidman (2008) remarks that “Many memorable election campaigns have helped national parties and their candidates to secure or maintain power” whilst posters, billboards and banners were the primary media of political communication in the nineteenth century and continue to be in importance in many countries today. Political advertising as a communication process aims in attracting the viewers’ attention towards what a candidate or a party has to say with the “intention of influencing their political attitudes, beliefs and/or behaviours” (Kaid 2004). With the appearance of television and the development of internet and social networking today, posters have a declining usage, however the political pose and electoral approach for mass persuasion through visual communication re-adapts its presence and techniques regardless of the medium. Seidman (2008) defines six key elements that affect the design, content, and usage of posters produced in the political realm, being *Technology, Social Attitudes, Education, Legislation, Advertising & Political Marketing* and *Art & Graphic Design*. The current study concentrates on *Art & Graphic Design*, particularly from the perspective of the candidate’s photographic image, the linguistic meaning of the main headline and the typography used in Cypriot elections since independence in 1960.

The pictorial/electoral imagery printing, other than painting or just text, became possible with the invention of lithography in 1796 by the German *Alois Senefelder*. With this printing evolution, not just political, but pictorial posters in general were mass-produced and distributed in much of the Western world.

“In electoral photography the nominee does not only attempt to establish a program with the voters but also a ‘personal link’ with them, articulated through ‘a style of life of which he is at once the product, the example and the bait’, heroized through the iconography of his appearance in familiar social settings, gestures and other predetermined set ups” (Barthes 1993). Interestingly we can observe how *John Kennedy* in the 1960s was evidently careful about his public photographs, paying particular attention in the lighting, his gaze, the background colours and his pose.

2. Investigating the literature review

The political poster is one of the most pervasive or even persistent expressions of political behaviour. For this reason, Dumitrescu (2010) stated that political posters are an important part of the visual battleground of election campaigns around the world and parties and candidates spend significant proportions of their campaigns communication finances on posters. She also identified two communication roles the poster content plays. The first is to provide “factual” information about the candidates. The second is to provide “nonverbal” information through

pictures of the candidate, signalling behavioural intent.

Political posters may promote different messages but they may also produce different emotions. In his study, Brader (2005) found that posters can significantly alter their motivational and persuasive power simply by using images that elicit emotions such as fear or enthusiasm. Specifically, when messages include enthusiasm eliciting images, campaign ads reinforce motivation and loyalty. Therefore, voters exposed to such messages show greater interest in the campaign, are more willing to vote and rely more on pre-existing references to choose a candidate. On the contrary, campaign ads including messages and fear-eliciting images cause a shift in decision-making criteria and changes in political choice. These findings underline the central role of emotions to whether and how a political campaign ad works.

Different feelings and preferences can also be elicited through the image of the candidate alone. Capistran (2013) argued that the posed, constructed and photographic image of the candidate in the studio or another controlled environment indicates the power of control by the individual represented. He conducted a semiotic analysis of the political posters from the pre-campaign period of the Mexican election in 2012 and found that many published images of candidate are of a testimonial type. These photos reinforce an informative rhetoric which is based on the concept of information. Candidates appeared controlled, smiling, safe, with a look of kindness and self-confident gestures which are “favorable” postures. The number of strictly posed photos was reduced while there were many images of candidates making speeches.

In a study investigating 20 years of election in Western Europe, Adams et al. (2006) found that while mainstream parties displayed consistent tendencies to respond to public opinion shifts, there is no evidence that niche parties responded to shifts in public opinion. Additionally, they found that in situations where niche parties moderated their policy positions they were systematically punished at the polls. Such findings suggest the need to analyse the posters of candidates from different political parties in search of the different messages and policy opinion that they express.

3. A brief historic and political background of Cyprus¹

Political advertisements can be an expression of the political and national history of a country, reflecting significant milestones in a nation's history. This can be the case with a country like Cyprus which has a long history of wars and national struggles for liberation, peace and democracy. Cyprus was under the British rule until the 1960 when, after a four-year liberation struggle, the island became independent and was proclaimed a Republic. When in 1963 the President of the Republic proposed some amendments to facilitate the functioning of the state, the Turkish Cypriot community responded with rebellion, the Turkish Cypriot Ministers withdrew from the Council of Ministers and the Turkish Cypriot public servants ceased attending their offices. In 1974, a coup was staged in Cyprus by the military junta, then in power in Greece, for the overthrow of the then President of Cyprus, Archbishop Makarios. Turkey used this pretext to launch an invasion in Cyprus in which the Turkish troops eventually occupied 37% of the island's territory. The Turkish invasion, signified a major change in people's lives since almost 40% of the population became refugees while others were enclaved and then forced to leave through the years.

The elections of 1960 were the first elections in the newly independent country. The elections of 1965 were postponed but the elections of 1973 and 1977 could reflect and reveal how the Turkish invasion changed the political advertising messages. In the following years, Cypri-

¹ More information on the Cyprus history can be retrieved from a relative website of the Press and Information Office in Cyprus (www.aboutcyprus.org.cy) and from the site of the Cyprus National Guard Official site (www.army.gov.cy).

ots attempted to recover economically and emotionally. Therefore in following elections of the 1980s and 1990s, politicians addressed the struggling people of Cyprus for a vote. Additionally, two other major events might have also played a role in the determination of the photographic image, the text and the final product in general of a political poster in the proceeding elections. The first is the acceptance of Cyprus in the European Union. Specifically, on 1 May 2004 Cyprus joined the European Union, together with nine other countries. The EU membership was accompanied by both privileges and obligations that set the formation of a newly acquired national identity; that is the European one. The second major event took place in March 2008, a wall that for decades had stood at the boundary between the Republic of Cyprus and the UN buffer zone was demolished. The wall had cut across *Ledra Street* in the heart of Nicosia and was seen as a strong symbol of the island's 32-year division. On April the 3rd 2008, *Ledra Street* was reopened in the presence of Greek and Turkish Cypriot officials. Since April 2008, a number of crossing points have opened up between the north and the south side of Cyprus bringing the two former communities closer according to some people or further apart, based on others.

Political campaigns through mass media are created for different elections like when presidential or parliamentary may take place in a country. For the present research, political posters/ advertisements from both parliamentary and presidential elections were selected.

4. The current study and research purposes

The current study deals with the analysis of political posters in Cyprus for the past 50 years, since state independence in 1960. The analysis includes not only the photographic image of the candidate but also the general set-up and the feelings that are promoted through the image. The importance of the study of political posters rests on the assumption that they could reveal both the candidate's strategy and the candidate's attempt to make some difference at the polls, in respect of their historic and social context. Having in mind that the ideological messages of a poster are largely hidden and implicit in nature, Barthes (1977) argued that the work of semiotics is important because it can reveal this masked ideological components in the produced collection of signs. For this revelation, he demonstrates the particular areas of focus: a) the denotative/connotative aspects of the image, b) the connotative aspect of the linguistic text in their relationship to their concomitant image, c) the way in which signs have been coded with ideological content and d) the way in which viewers/receivers, because of their cultural knowledge, likely to read or interpret the message. Kress and van Leeuwen (2006) also stated that since images are socially constructed, "the communication requires that participants make their message maximally understandable in a particular context, therefore they choose forms of expression which they believe to be maximally transparent to other participants". In other words, political posters communicate a message through both the image and text, but the interpretation is always affected by the cultural, social and political context and current situation of the country. Therefore, in the present research, political posters from 1960 until 2013 were used and both image and text were analysed in order to examine how ideologies are constructed in different contexts.

The purpose of this study is: a) to examine which non-verbal attributes and connotative mechanisms are used by candidates in the construction of their political image; b) to investigate the linguistic meaning of headlines in political advertisements; and c) to explore the semiotic characteristics of the typography used for the main headline texts.

5. Methodology

One hundred and forty seven (147) political posters, web and print advertisements were taken for analysis. These posters came from presidential and parliamentary elections from the 1960s until today. All posters include an image of the candidate. The posters were drawn from

the *Press and Information Office* (PIO) in Cyprus, the archives of different local newspapers, local magazines and from various advertising agencies that dealt with political campaigns. There was a reduced amount of posters and advertisements from the decades of 1960 and 1970 due to the fact that very few newspapers and printing companies were operated at the time, as well as, for the reason that *Makarios* was simultaneously both, president of the republic and Archbishop of Cyprus. His double role as a religious and political figure made him powerful and popular among people with limited opposition to worry about. As a presidential candidate he did not really have the need for political campaigns to convince his voters (usually the majority of the population) during these first decades.

In terms of the corpus, it is estimated that most of the available material was collected in order to have a comparable number of posters and advertisements from each category to compare. From the rest of the decades, the material was randomly selected.

The posters were analysed using on a coding frame that was developed based on previous published work. The coding frame included variables concerning three major semiotic resources: the analysis of the photographic image, the analysis of the linguistic messages and the analysis of the Typography used for the main headline text. The variables concerning the **photographic image of the candidate** and the general set-up of the poster were the following: (1) *eye contact*, (2) *point of view (low-angle, eye-level, high-angle)*, (3) *point of view (face-to-face, profile)*, (4) *size of photo*, (5) *close-up photo*, (6) *pose impression*, (7) *facial expression*, (8) *objects*, (9) *clothes*, (10) *feelings* and (11) *set-up*. The variables for the **linguistic analysis of the text** were the following: (1) *emphasis*, (2) *discourse*, (3) *image of the candidate*, and in terms of **typography**, (4) *case*, (5) *slope*, (6) *shape*, (7) *weight/value*, (8) *orientation*, (9) *location*, (10) *texture* and (11) *scale*.

Each decade from the 1960s until today is characterised by a major historical event as described in the brief historic and political background of Cyprus. Therefore, the political posters were divided in different periods based on the historical milestones on each decade. The periods were the following: (1) 1960–1973 which is the period before the Turkish invasion, (2) 1974 until 2003 which is the period after the war and (3) from 2004 until the latest elections in 2013 which is the period from the inclusion of Cyprus in the European Union and onwards.

6. Results

Analysis of the image.

A crosstabulation comparing all the variables of the coding frame across different decades was performed. As for the image, significant differences were found concerning *eye contact*, *point of view (face-to-face, profile)*, *pose impression*, *facial expression* and *objects*.

In detail, there were significant differences across time periods concerning *eye contact* of the candidates [$\chi^2(2)=14.33$, $p=0.001$]. Specifically, in the majority of political posters in the period from 1960–1973, the candidates do not have *eye contact* (88.9%) while in the periods from 1974–2003 and from 2004 onwards the majority of candidates have (72.5% and 71.3% respectively).

There were also significant differences across time periods concerning *point of view (face-to-face, profile)* [$\chi^2(4)=31.3$, $p=0.00$]. In detail, in the majority of political posters in the period between 1960–1973, the candidates have a *profile* photo (66.7%) while in the periods from 1974–2003 and from 2004 onwards, most pictures of candidates are taken from the *front* (90.2% and 94.3% respectively).

The analysis also indicated significant differences across time periods concerning the overall *pose impression* [$\chi^2(4)=28.56$, $p=0.00$]. Specifically, in the majority of political posters in the period between 1960 and 1973, the candidate is presented mostly as an *older and experienced man* (66.7%) and in the rest of the cases as a *controlled, self-confident, smiling man* (33.3%). There

are no candidates presented as *young and good looking*. On the other hand, in the periods from 1974–2003 and from 2004 onwards, the majority of the candidates are presented as *controlled, self-confident, smiling men* (92.2% and 72.4% respectively). In the rest of the posters, they are presented as *older and experienced* or as *young and good looking*.

In addition, there were significant differences across time periods concerning *facial expression* of the candidates [$\chi^2(8)=64.68$, $p=0.00$]. In detail, in the majority of political posters in the period from 1960–1973, the majority of candidates have a calm facial expression (66.7%) and in the rest of the cases they are smiling (33.3%). There are no candidates with positive, neutral or sad facial expression. On the other hand, in the periods from 1974–2003 and from 2004 onwards, the majority of the candidates are presented either with a smile or with positive facial expression or less frequently with a neutral expression. In very few instances they are presented as calm or sad.

The *objects* present in the posters were also found to differ across time periods [$\chi^2(6)=40.09$, $p=0.00$]. In particular, in the majority of political posters in the period from 1960–1973, there are no other objects (66.7%). However, in the case where the candidate is the archbishop of Cyprus, he is presented sometimes holding his sceptre (33.3%). Similarly, in the periods from 1974–2003 and from 2004 onwards, the majority of the candidates are presented with no other objects in the picture. Interestingly, only after 2004, the flag of Cyprus and the European Union become present in the posters.

Analysis of text.

Significant differences were found concerning emphasis, discourse, image of the candidate, case, shape, location and scale. In detail, there are significant differences across time periods concerning *emphasis* of the linguistic message [$\chi^2(2)=30.29$, $p=0.00$]. Specifically, all the political posters in the period from 1960–1973 emphasize on ideology. In the period from 1974–2003 the majority of the posters emphasize on ideology (82.4%) and the rest on party affiliation (17.6%). On the contrary, in the period after 2004 until today, the majority of posters emphasize on party affiliation (59.8%) and the rest on ideology (40.2%).

There were also significant differences across time periods concerning *discourse* on the poster [$\chi^2(12)=23.99$, $p=0.02$]. Specifically, in all the political posters in the period from 1960–1973, the discourse emphasizes on ideology. In the period from 1974–2003 the discourse in the majority of the posters emphasizes on ideology (45.1%) and the rest on national security and the war of 1974 (21.6%) and the credibility of the candidate (17.6%). Similarly, in the period after 2004 until today, the discourse in the majority of posters emphasize on ideology (59.8%) and less on national security and the war of 1974 (9.2%) and the credibility of the candidate (12.6%).

The *image of the candidate* through the text was also found to differ [$\chi^2(4)=66.97$, $p=0.00$]. In detail, all the political posters in the period from 1960–1973 represent a strong leader. In the period from 1974–2003, many of the posters present either a knowledgeable (39.2%) or a strong leader (35.3%). On the contrary, in the period after 2004 until today, the majority of posters represent an inspiring leader (74.7%).

Significant differences across time periods were found concerning the headline letterforms in the poster [$\chi^2(2)=7.83$, $p=0.02$]. Specifically, in the majority of political posters in the period from 1960–1973, the text is in capital letters (66.7%). On the contrary, in the periods from 1974–2003 and from 2004 onwards, the text in most posters is in small letters. The shape of the text present in the poster was also found to differ [$\chi^2(6)=45.19$, $p=0.00$]. Particularly, in the majority of political posters in the period from 1960–1973, the shape of the text is serif (66.7%). In the rest of the posters, the sans-serif shape is used and there is no use of rounded shape of text or script. On the contrary, in the periods from 1974–2003 and from 2004 onwards, the text in most posters is sans-serif shape. There are also posters using script shaped or rounded shaped text.

There were also significant differences across time periods concerning the placement of the text present in the poster [$\chi^2(12)=21.55$, $p=0.045$]. Specifically, in all the political posters of the period from 1960–1973, the text is near the candidate. On the contrary, in the majority of the posters of in the periods from 1974–2003 and from 2004 onwards, the text is again near the candidate but there are also instances where the text is either in the top or the bottom of the poster or somewhere away from the candidate.

Finally, the emphasis on the text and the picture [$\chi^2(4)=21.70$, $p=0.00$] was found to differ across decades. It is interesting that only in the period from 1974 until 2003, there is more emphasis on the text than the picture of the candidate in the majority of the posters.

7. Discussion

The current study had three levels of analysis and research. First, to examine which non-verbal attributes/connotative mechanisms are used by candidates in the construction of their political photographic image, second to investigate the linguistic aspects of headlines in political advertisements and third to examine which semiotic dimensions characterise the typography of the main headline texts.

For the first level of analysis, the results indicated that after the Turkish invasion in 1974, candidates have *eye contact* with the viewers as well as pose with *frontal* portraits (point of view). This representation of where do the eyes look is often associated with the idea of demand (Kress & Van Leeuwen, 2006). After the 1974 war and the entry of Cyprus in the European Union in 2004, the candidates are looking at their voters attempting/demanding to develop a relationship of engagement, in equal 'visual terms' with their viewers/voters. In the period from 1960–1973, the candidates are *profile* photographed, look *older and experienced* with *calm facial expressions*, offering their profiles to be 'looked-at', voters are not being part of their gaze, the candidates are there to be admired. During these first decades, *Makarios* as archbishop of Cyprus was obliged to have a holy and religious photographic image (usually with a sceptre, an *object* to remind his sacred role) which inevitably was reflected and used for defining a divine/holy presidential portrayal as well. On the other hand, in the periods from 1974–2003 and from 2004 onwards, the majority of the candidates are presented either with a *smile* or with *positive facial expression*. It is evident that the Turkish invasion on the island in 1974 and the 2004 European Union entry were critical points changing the ways that politicians constructed their image on electoral campaigns. In general, and after 1974, the photographic image of candidates though its representation, becomes friendlier, approachable and vernacular, obviously on an attempt to gain the citizens' trust – and consequently their votes – via 'equalising' their photographic profile and visually pose at the same level with them. Maybe this approach attempts to give the impression that candidates are part of the voters, and being like them, they would understand and share similar problems and needs. Additionally, after 2004, the European flag is also evident on most of the campaigns, reminding the voters of the candidates' 'commitment' to develop a new European identity for the people of Cyprus, a change under a European perspective.

For the second level of analysis, thus in respect of the linguistic message, it is observed that the period from 1960–1973 *emphasizes* on ideology. In the period from 1974–2003 the majority of the posters emphasize on ideology and the rest on party affiliation whilst interestingly, in the period after 2004 until today, the majority emphasize on party affiliation and the rest on ideology. Party affiliation is a very popular approach of attracting voters in Cyprus and it is interesting to observe that this emphasis was put aside after the 1974 war, a period that ideology seems to have been more important for the re-construction of a divided nation.

In terms of *discourse*, all the political posters in the period from 1960–1973 emphasize on ideology. In the period from 1974–2003 the discourse in the majority of the posters emphasizes

mainly on ideology, then on national security, the war of 1974 and the credibility of the candidate. In the period after 2004 until today, still the discourse in the majority of posters emphasize on ideology, however less on national security, the war of 1974 and the credibility of the candidate. This might be due to the fact that even until now, on-going political negotiations are failing to provide any solution for the unification of the island and candidates seem to give up in using these arguments in their campaigns, especially with Cyprus being theoretically under the official security of the European Union.

Additionally, for *the image of the candidate* through the text, all the posters in the period from 1960–1973 were found to represent a strong leader, in the period from 1974–2003 many of the posters describe either a knowledgeable or a strong leader whilst in the period after 2004 until today, the majority of posters designate an inspiring leader. The findings could be interpreted in respect of the historical context of Cyprus. The state independence was established in 1960 where a leader had to be strong to provide the foundations and start the nation, whilst after the war invasion in 1974 the candidates are knowledgeable and strong leaders, thus people who would have the understanding, awareness and strength to find a solution for the divided nation. After Cyprus joined the European Union, the portrayal of inspiring leaders in political advertisements is usually what is related and expected with the European philosophy, which are people who could foresee opportunities and perspectives that open under the European umbrella.

In the final level of analysis it is interesting to see how typography compares with the linguistic meaning, the image and the historic context of the advertisements. In particular, before 1974 the writing/letterforms appear to be imposing, loud and aggressive whereas after the war, typography calms down and becomes more friendly and personal. This seems to match and support the photographic message as well as the linguistic text, where campaigns become ‘friendlier’ and ‘polite’ after the invasion of 1974 a conclusion that reflects very well what Williamson (2002) describes that, “[w]e can only understand what advertisements mean by finding out how they mean, and analyzing the way in which they work”

COGNITIVE SEMIOTICS

NEUROSEMIOSIS – AN EXPLANAT OF CONSCIOUSNESS

Karl Gfesser
Universität Stuttgart, Germany
(kgfesser@web.de)

Abstract

How does mind come about? Or more precisely, since long existent, how does mind reveal itself from matter – from the biotic, complex and highly organized matter of the brain? In trying to answer this question, philosophers get entangled in subtly differentiated hypotheses such as the identity *of* mind and matter, causality *through* matter, correlation *to* matter, representation *of* matter, reduction *to* matter, emergence *from* matter, supervenience *on* matter – mind understood here as consciousness and matter then as the brain, even though both terms correctly apply only in their processuality. The idea of a *condition*, used in this context, remains conceptually unclear and is not applicable.

In this paper, I will try to identify, as clearly as possible, what kind the processes under discussion are. To avoid misinterpretations, I will try my best to shun inappropriate metaphors, analogies and pleonasms. Epistemological curiosity – an instinct, by the way, whose neurological exploration is still pending – is pressing for further research, even though some claim it is a futile endeavor: we are denied neurological access to our consciousness, they say, since the brain is structured as an organ of survival and not made to reach self-awareness. I do not lay claim to bridging this gap of cognition, neither do I intend to avoid the problem out of resignation. However, no inappropriate *explanans* shall be added to the *explanandum*, but such an *explanans* shall be hypostatized, which will allow a conclusive *explanat*. Neurosemiosis should be readily comprehensible in terms of meta- and object language in order to make clear what the object under discussion is. I will make the bold assumption that the human brain is a semiotic system. For this reason, the descriptive object language shall be *semiotically* oriented, the controlling

meta language shall be *semiotic*; if both were to coincide, the object, the neuronal process and the resulting process of consciousness could not be grasped. In particular, I will investigate the issue of free will, contested by some brain researchers, because without willful, conscious intentionality, we could not conceive of a self-aware personality, without which we could not explain cognitively and, ultimately, we would not understand reason, which is the epitome of all that.

It is certainly difficult to define what constitutes consciousness without using twisted metaphors that all too often turn out to be pleonasm. The use of possessive, instrumental, local and directive prepositions (in the example of the hypotheses cited above), probably unavoidable, gives a hint how normal language – in other situations so helpful – can be misleading, as it insinuates that the relation of the brain to mind were instrumental, the relation of consciousness to the brain were spatial. And the research of neuroscientists in turn has not reached beyond results dealing with perception – namely, vision, audition, gustation, olfaction and tactility –, in addition to interoception such as thirst and hunger, pain and pleasure, as well as proprioception, self-perception in time and space, not to forget affections such as fear, aggression, emotional attachment. The greatest enigma, however, we have not yet solved: apperception and self-aware cognition. Philosophers and cognitive scientists as well as brain- and neuroscientists have some problems in describing, or rather circumscribing, neuronal and cognitive processes and the connection between the two. There is monistic agreement about this connection that is only questioned by a few persistent dualists. It goes without saying that any circumscription of a process is not the process itself.

Neurological researchers, in describing their work – which ultimately is the activity of their own brain – cannot avoid using so-called natural language. If language is natural, it points to its origin, to the nature of man who has created this language both as part of nature and through conflict with nature and with himself and his own kind. In trying to understand brain activity, we apply a measure that comes from this very activity of the brain itself. We presuppose hypotheses and make experimental use of equipment with the aim to confirm those hypotheses according to a given theory – just as cerebral activity, consciously or unconsciously, brings about mental activity, which is also formed by language and therefore may be understood in semiotic terms, since natural language is the sign system all other sign systems are derived from. Our aim is to trace the genesis of semiosis.

Semiosis owns its genesis to the primary sense of sight and to the intention to handle and make something, at first by hand, later through the use of tools and then machines and nowadays with technology enabling access to the nano range. To intend something, to see, to illustrate, to depict, imagine, treat, represent, reflect on, realize, understand, conclude, reach, discuss, negotiate are examples of performative verbs referring to possibility, reality, causality, finality, intentionality, activity, communicativity.

The genesis of semiosis (Gfesser 2004) also goes back to the intentional impulse as well as to the explorative drive of man, in systemic unity of brain, body and the outside world. “[...] the brain’s architecture is [...] dynamically coupled with the systems in which it is *embodied* and the environment in which it is *embedded*.” (Welshon 2011: 263) This also applies to the semiosis of cognition. (Gfesser 1997)

Those systems are the organs of the human body, not least the peripheral and the central nervous system of which the brain is a part. This is the most complex of all systems, consisting of 10^{10} to 10^{12} neurons, each connected to, “on average 7,000” other neurons, some with “as many as 100,000 connections”, 10^{14} connections in bit/sec. The number of synapses in the human brain varies “between 60 and 500 trillion in adults and approaching perhaps 1,000 trillion – a quadrillion – in prepubescent children.” (Welshon 2011: 331)

The brain's components are manifold: from the bigger parts, the midbrain, hindbrain and forebrain only the latter will be mentioned, composed of the cortical cerebrum consisting of the prefrontal, frontal, temporal, parietal, occipital, and cingulate cortex, the subcortical cerebrum consisting of the corpus callosum, claustrum, basal ganglia, the limbic system consisting of nucleus accumbens and amygdala, the subcerebral system consisting of pituitary, hypothalamus, epithalamus, and thalamus. Welshon declares: (2011: 324–26):

Finally, there is the *neocortex*, or, as it is also called, *isocortex*. These terms refer to the phylogenetically young and structurally complex cortex that constitutes 90 per cent of all human cortex. [...] Within the category of neocortex, functional subdivisions are usually introduced. First, we can subdivide between *idiotypic cortex* and *homotypic cortex* or *association cortex*. Idiotypic areas include primary motor cortex, primary somatosensory cortex, primary visual cortex and primary auditory cortex. Association cortex constitutes the largest region of the human brain.

If one part of the brain is able to be the core of consciousness then it may be this region because “there are *unimodal* or *modal-specific* zones, *heteromodal* [...] *higher-order* zones and *supramodal higher-order* zones.” (Welshon 2011: 326) This is the region where special functions interact and create loops. (Harth 1995: 70–73) Those creative loops will be able to culminate in consciousness. Harth assumes: (1995: 145):

Consciousness is like a wedge driven between the *whence* and the *hence* [...] where intentionality, volition, and creativity is spawned. The sources that feed into these loops may be sensory inputs that then are modified by the system. [...] Other sources are concepts, nascent ideas, originating at higher cognitive levels, for example, through associations, that then generate images. Finally, [...] the cerebral dynamics may be affected by fluctuations of neural activity [...]. [...] these fluctuations contain bits of old memories and associations of different strengths, the faintest ones blending into and becoming part of the neural background noise. Any one of these may be admitted into self-referent loops and, once selected, will be amplified and lead to further elaboration and imagery.

The grammatic concepts of *subjunctive II* – if it would have happened – and *future perfect* – it will have happened – may serve to illustrate what is meant by the whence and the hence: consciousness, being here and now, nonetheless is switching from the present into the past, transmitting the past into the present or future by hypothesizing now that, which already would have been done or will be done. Consciousness is meant as an indivisible but discernible mental or psychic process, an instant mode of sensitive, appetitive, self-aware, emotional, intuitional, intentional, perceptual, experiential, cognitive moment.

The development of the brain from *hominid* to *homo sapiens sapiens*, knowing and self-aware man, occurred through the tools-creating use of the hands and the cognition-guiding use of language, through conscious attention and directed effort in the cingulate cortex, in alternation with thinking and decision-making in the prefrontal cortex and emotional and episodic weighting of these processes in the limbic system. First and foremost, this development is due to the behavior of humans in their environment: *locomotion* accompanied by *emotion*, *extension*

condensed to *intention*. Once the *existing external* object was abstracted to an *imagined internal* object, it could be linguistically externalized and thus be communicated. This perspective throws some light on the opaque origin of consciousness.

Compared to the development of the *hominid* to *homo erectus* who lived on a somewhat animal level for millions of years, the development of human consciousness took a very short time, about 200,000 years. Once the process had started, the use of the hands, now communicable through language, accelerated – even though we have to assume that language is not of genuinely communicative but rather imaginative origin. *Similar* perceptions evoked *analog* imagination that called for designations to allow repeated use, it called for a repertoire of individual signs that could be shared supraindividually and thus serve for communication. Physically, this was made possible through the lowering of the larynx and through an enlarged pharynx that provided space and resonance for articulated sounds.

Consciousness is *individually embodied, ecologically embedded, and socially distributed*, (Gfesser 1997: 147–148; Walter 2014: 30–32) based on sentience in *iconic* similarity, observation in *indexical* identity and meaning in *symbolic* interpretation. *Iconic-indexical* denoting progressed to the point of *symbolic* denoting. (Peirce 1960: CP 2.247–2.249) People communicated an idea by pointing at something and thus denoting it, which found expression in the grammatical function of verb, subject and object. This is to be found in all languages analyzed for this structure and reveals the unity behind multiplicity.

Grammatical functions as such are semiotic functions stemming from neuronal functions. Within these neuronal causes, I would like to differentiate between a *causa efficiens*, an efficient cause, and a *causa finalis*, a final cause, which acts back on the efficient cause. The final cause is intentional, the efficient cause is neuronal in nature. The intention activates dynamic neuronal patterns thereby ascertaining itself. The frequently used expressions supervenience and emergence, however, are functionally unclear expressions referring to their logical complement, namely subvenience and substance, which in both cases is nothing but the brain itself. Materially, these expressions explain nothing.

Materially, the brain is an efficient cause, just like the human organism as a whole. For this reason, it is an error in judgement for brain researchers – who confine themselves to the examination of the brain and, besides, are only able to examine smaller parts of the brain, due to technological limitations, – to make general statements about human abilities. The brain is part of the whole, but it doesn't stand for the whole. Neuronal semiosis commences in the peripheral nervous system, not in the cerebral system, even though it culminates there in the neocortex. "The neocortex records patterns in a hierarchy" that it retrieves "autoassociatively". (Hawkins 2006: 88) Hierarchy here means the six layers of the neocortex. Within these layers, the neurons form patterns, i.e. a collective neuronal activity, (Hawkins 2006: 136) but the neurons also interact between the layers of the above named regions of the cortex in an ascending and descending manner.

The patterns of the neocortex, which may be considered a *causa formalis*, a formal cause, offer a prediction for an intended neuronal activity. "Prediction is [...] the primary function of the neocortex and the basis for intelligence". (Hawkins 2006: 112) "Prediction is the application of invariant memory sequences on new situations. Therefore, all cortical predictions are predictions by analogy", (2006: 222) allowing for intentional and imaginative recourse. Foucault speaks metaphorically of a "murmuring of similarities", an "always possible recourse of imagination". (1971: 104) Johnson states: "...any adequate account of meaning and rationality must give a central place to embodied and imaginative structures of understanding by which we grasp our world." (1987: XIII)

Neuronal interaction occurs through dendrites and axons. Dendrites receive signals. Ax-

ons, if within an electrical readiness potential lasting about a millisecond, informally known as spikes, send signals to other neurons by secreting chemical neurotransmitters at synapses. “The number of possible patterns that can exist on only one thousand axons is larger than the number of all molecules in the universe.” (Hawkins 2006: 163) Harth calls the descending and ascending neuronal interaction between the layers of the cortex “the loop”. The loop is “self-referent” and “is to be accomplished by an optimization process [...]” (1995: 107) Werth explains this self-reference as physical-psychoic intereffect: “certain neuronal processes bring about feelings,” but it is also the other way round, “feelings bring about neuronal processes.” (2010: 151) “This could be called the complementarity principle of neurobiological phenomena and feelings.” (2010: 152) It would be futile “to look for a consciousness independent from sensory perception, thoughts and emotions. Their entirety make up consciousness.” (2010: 86)

Consciousness in its entirety is produced by a cerebral vibration of 40 Hertz, a “temporal structuring of brain activity, thus the creation of simultaneity everywhere in the brain.” (Pöppel 1982: 183) Pöppel deduces “that all activities that occur within a temporal frame in different regions of the brain are the experience of perception *itself*.” Roth declares: “In terms of its cellular components and intrinsic synaptic structure, the cortex is very homogenous [...]” (1996: 106)

The meta language of brain research is chemical, physical, cybernetic, biological, but also metaphysical: there are verbs used like to react, to cause, to determine, to signal, to inform, to correspond, to stimulate, to effect, to fire, to embody, to influence, to mirror, to model. Janich urges brain researchers “to relate *descriptions* of neuronal processes to *descriptions* of people’s verbal and cognitive performances.” (2009: 74) The point here is that brain researchers take sentences of observation about some brain activities as fact, and assume they are using an object language, although they are caught in an arbitrary meta language without having defined its “normative basis”. (2009: 179) An object language in turn requires operationalization so that “an explanandum – a phenomenon to be explained – is sufficiently defined.” (2009: 179)

With regard to the models of brain researchers, Janich urges to make a distinction between “a model of” and “a model for”. “The former should be taken as a partial model of the structure of an object, the latter as a partial model of its function or functions. It must be possible to describe both in the form of ‘X is model of/for Y in relation to criteria C.’” Epistemologically, this concerns the question “whether nature provides a structure to the model or whether the model presets or imposes a structure or a function on nature.” (2009: 165–166)

To make a decision for the one or the other above-mentioned model resides with the individual brain researcher. After all, the ones doing the research are the brain researchers themselves, and not just their brains. One such researcher, for example, wants to make us believe that the self or the ego has vanished: “In reality [...], a concept such as ‘the’ self does not exist.” (Metzinger 2011: 23) That is an assumption due to over-determined, over-interpreted studies of cerebral action patterns that are merely isolated, local and barely regional in scope. The concept of the self or the ego eludes this type of studies because it cannot be mereologically defined, and is physiologically not perceivable.

Feyerabend does not think mereologically, i.e. not *pars pro toto*, in noting: “[...] the world is a projection of the brain, which in turn is part of the world [...]” But “the totality of world-brain is lacking the resources required to know itself.” (1997:137) Likewise, McGinn (1996: 72) believes that the brain can neither make its phylogenetic origin nor its ontogenetic development an object of examination – which is inconsistent, even if it may be true. “Who can be so smart, for evolutionary reasons, to consider mankind, for evolutionary reasons, too dumb for true self-awareness?” (Janich 2009: 78) Nørretranders notes succinctly: “Since consciousness is a primary entity that is exclusively measured through conscious experience, we have to face the fact that the only criteria for consciousness is itself. [...] *Conscious is only the conscious mind*.” (1994: 321)

Now, what about Libet's well-known and repeatedly reconstructed experiment, which showed that the decision to move a hand only becomes conscious after "an average of about 350 ms" (1983: 623) and thus, at the very first, is not a conscious and therefore not a deliberate decision? Libet et al. state: (1983: 635–636):

It is clear that neuronal processes that precede a self-initiated voluntary action, as reflected in the readiness-potential, generally begin substantially *before* the reported appearance of conscious intention to perform that specific act. This temporal difference of several hundreds of milliseconds appeared fairly consistently regardless of which of the available criteria for onset of RP or for the time of awareness are adopted.

Experiments of this kind are concerned with actions, according to Janich, (2009: 160) and not with behavior or reflexes. "But it goes without saying that acting cannot be subject of experimentation for the very fact that it is not sheer, natural behavior." Acting yields personal experience. And "*experience* can be defined as *what has befallen a person in acting*. A person acting experiences success or failure of his actions." (Janich 2009: 149) We learn from experience, which in turn will influence our future actions. Logically and practically, an action cannot be repeated. This does not fully apply to the study participants in Libet's experiment. They only followed instructions and behaved accordingly, they were not truly performing volitional actions.

Nørretranders remarks this about Libet's experiments on readiness potential: "It is true that consciousness sets in only *after* the brain has become active, but on the other hand, it does set in *before* the hand starts moving." (1994: 351) "0.2 seconds pass from the conscious experience of the decision to its execution. [...] The conscious mind has enough time for a veto before the decision is put into action." (1994: 351) Libet's test persons "could interrupt themselves. Thus they had free will. *The conscious mind cannot begin the action, but it can decide not to perform it.*" (1994: 351–352) A person putting in a veto is able to announce it, which means "that a willful decision becomes a conscious willful decision through the fact that a person making a decision is mentally able to predict how he or she is going to behave [...]" (Werth 2010: 182) It seems that consciousness needs a certain time for reflection. Libet et al. admit: (1983: 640–641):

The absence of any larger meaning in the simple quick flexion of hand and fingers, and the possibility of performing with capriciously whimsical timings, appear to exclude external psychological or other factors of controlling agents. [...] There could be a conscious 'veto' that aborts the performance even of the type of 'spontaneous' self-initiated act under study here. This remains possible because reportable conscious intention, even though it appeared distinctly later than onset of RP, did appear a substantial time (about 150 to 200 ms) before the beginning of the movement as signaled by the EMG.

There is a "neural voting" by different kinds of synapses. "*Excitatory* synapses say 'yes' because they make electrical current flow *into* the receiving neuron, which tends to 'excite' spiking. *Inhibitory* synapses say 'no' because they make current flow *out* of the neuron, which tends to 'inhibit' spiking." (Seung 2012: 55–56) Seung calls readiness potentials action potentials. "In axons, electrical signals are brief pulses known as *action potentials*, each lasting about a millisecond. [...] Action potentials are informally known as 'spikes', owing to their pointy appearance [...]. When a neuron spikes, it is said to be 'active.'" (2012: 48)

Inhibition is crucial to the operation of the nervous system. Intelligent behavior is not just a matter of making appropriate responses to stimuli. Sometimes, it's even more important to *not* do something – not reach for a doughnut when you're on a diet, or not drink another glass of wine at the office holiday party. It's far from clear how these examples of psychological inhibition are related to inhibitory synapses, but it's at least plausible that there's some sort of connection. (Seung 2012: 56)

From Libet's experiments with only a few probands, Metzinger, among other authors, concludes that humans cannot have free will. One of "the most stupid arguments for free will is: 'I *do know* that I'm free because I experience myself as free!'" Metzinger, however, wants to make us believe that the notion of free will is a delusion, based on the incongruous argument that the world we experience "full of colorful objects" is only a world consisting of "mixed wave-lengths of the most diverse kind". (2009: 191–192) Apart from the fact that benevolent and malicious actions have corresponding effects or consequences, Metzinger's comparison, by equating psychic spontaneity with physical receptivity, is nothing but a category error. Besides, he contradicts himself by postulating the "unconditional will to self-awareness, to truthfulness" and a "will to clarity" (2009: 337) or by stating: "But whatever is *available* for *volitional* attention is also that, which we consciously experience." (2009: 73)

To know to be able to want something, to not be able to want something, to be supposed to want something, in other words to know about the possibility of volition as well as about its limitation and obligation ascertains us of our existence. According to Kant

the will [...] is a faculty either to produce objects corresponding to ideas, or to determine ourselves to the effecting of such objects (whether the physical power is sufficient or not); that is to determine our causality. [...] Now, here there comes in a notion of causality justified by the critique of the pure reason, although not capable of being presented empirically, viz., that of freedom; [...] the law of causality from freedom, that is, with a pure practical principle. (2012-2013: 14–16) Practical principles [...] are subjective, or maxims, when the condition is regarded by the subject as valid only for his own will, but are objective, or practical laws, when the condition is recognized as objective, that is, valid for the will of every rational being. (2012–2013: 16)

Clearly, any act of volition, any willful decision is biographically conditioned. An unconditional will is nobody's will, no will at all. Will cannot be defined as such, but only in the predominant personality persisting – nonetheless experientially, cognitively and mentally changing – in the connectome, that is "the totality of connections between the neurons in a nervous system". (Seung 2012: XIII) Even if a decision commences on the subliminal level, its effect is supraliminal, since the limen is both border and connection at the same time. Peirce remarks: (1958: CP 8.311):

I cannot admit the *will* is free in any appreciable measure [...]. [...] chance can only amount to much in a state of things closely approximating to unstable equilibrium. Now in the act of willing there is no such state of things. The freedom lies in the *choice* which long antecedes the will. *There*, a state of nearly instable equilibrium is found.

Peirce, not a neuroscientist but above all a semiotician, states after semiotic and epistemological, but also psychological studies: (1960: CP 1.112):

The observation of facts has now taught us that the ego is a mere wave in the soul, a superficial and small feature, that the soul may contain several personalities and is as complex as the brain itself, and that the facilities, while not exactly definable and not absolutely fixed, are as real as are the different convolutions of the cortex.

Peirce's different convolutions of the brain, called connectomes by neuroscientist Seung, also contain the complexity of the soul, of the ego, of the self, of consciousness, personal identity – whatever modalities of mind one presupposes in neurophysiological studies. “[...] neuronal connectomes will vary greatly across individuals and will be strongly influenced by experiences. These are the connectomes we must study if we want to understand human uniqueness. And we should examine them for traces of the past, for what could be more integral to our uniqueness than our own memory?” (Seung 2012: 184) “The problem is that the doctrine's central quantity – the connectome – has been unobservable.” (Seung 2012: 132)

The reason is that the “brain contains 100 billion neurons, a fact that has overwhelmed even the most fearless explorers.” (Seung 2012: XIX) Neurons spread out to other neurons by branches. “A branch of a neuron, called a *neurite*, can extend from one side of the brain to the other, yet can also narrow to 0.1 micrometer in diameter. These dimensions differ by a factor of one *million*.” (Seung 2012: 41) Contact between neurons is achieved through the synapses and through communicating neurotransmitters. “More than one hundred neurotransmitters have been discovered so far”, notes Seung. (2012: 43–44) “Axons send signals to other neurons by secreting neurotransmitters at synapses.” (2012: 48) “The brain secretes thoughts!” (2012: 45)

“One important property of a synapse is its strength, its weight in the vote conducted by a neuron when ‘deciding’ when to spike. It is known that synapses can strengthen and weaken; you can think of such changes as *reweighting*.” (Seung 2012: 77–78) “Synapses can also be created and eliminated, a phenomenon I'll call *reconnection*.” (2012: 78) “Reconnection provides added capacity for information storage, compared with reweighting alone.” (2012: 90) “It might seem that synapses are [...] generated ‘on demand’ only if needed for cell assemblies or synaptic chains. But in fact synapses are created randomly, and then the unnecessary ones are eliminated.” (2012: 89) “We know for sure that reweighting and reconnection happen in the brain. Whether these phenomena create cell assemblies and synaptic chains is unclear, however.” (2012: 93)

It is plausible to view the cerebral reweighting and reconnecting as the balancing principle of reason. Reason judges the validity of principles. And it is preceded by an effort of the will to fathom those principles. Reason is the pursuit of knowledge, the mental desire to understand that goes back to a child's bustling curiosity. “The connectome is where nature meets nurture.” (Seung 2012: 95) Herder speaks of the thoughtfulness of man, which is “the moderation of all his powers”, the “reason” of man. “*Man has been put in the state of thoughtfulness, which is his property, and this thoughtfulness (reflection) freely asserting its influence has invented language.*” (1901: 45–47) “Man shows reflection when the power of his soul is so free that it can create a wave in the ocean of his feelings that goes through all his senses, create ONE wave, if I may call it that, stop it, direct his attention to it and be conscious that it be attentive.” (Herder 1901: 47) Hegel speculates dialectically: “The *understanding determines*, and holds the determination fixed. *Reason* is negative and *dialectical*, since it dissolves the determinations of the understanding into nothing, it is *positive*, since it generates the *universal*, and comprehends the particular

therein.” (Hegel 2010: 10)

Let me come to a semiotic assessment. I would claim that semiosis begins right in the neuronal system, sensually fed, of course. There is only a difference concerning the phylogenetic and ontogenetic origin of semiosis, because much of the ability for semiosis was phylogenetically developed over many generations but, from an ontogenetical perspective, is still innate. Not being a neuroscientist, my explanation of neurosemiosis is in *semiotic* meta language and in *semiosically* oriented object language. In support of my argument, I mentioned some persuasive approaches and insights in the field of brain research, mainly certain zones in the association cortex, namely the unimodal or modal-specific zones for reception, the heteromodal zones for perception, the higher-order and supramodal higher-order zones for apperception, further the creative loops and their self-reference, their selections and amplifications, the hierarchy of the six layers of the neocortex and their patterns, the ability of prediction, the ascending and descending neuronal processes, finally the reconnection and reweighting of neurons.

Semiotically speaking, according to Peirce, a sign is the relation of the quality, the object and the interpretant. (Peirce 1960: CP 2.243–2.253) The external sign relation consists of the physic-energetic quality, the external object, the external interpretant, which is an individual’s mind. The internal sign relation is the sign-internal quality, the sign-internal object, and the sign-internal interpretant. If semiosis originates in neuronal processes, neuronal processes and sign internal processes of the sign-internal quality, the sign-internal object and the sign-internal interpretant are a *complement* of each other, in such a way that the sign-internal quality is the spiking of neurons as “an actual existent”, (Peirce 1960: 2.243) the sign internal object are the neuronal patterns and loops, the sign internal interpretant is the connectome. There is no gap of explanation. Having said that, we are switching from *semiotical* terminology to *semiosical* terminology: the *explanandum*, i.e. the sign process, is *complementary* to the *explanans*, the neuronal process; they are not identical because they are different in nature, one is mental, the other biotic. The *explanat* belongs to the concept of *neurosemiosis*, which is both a *neuronal* and *semiosical* synchronic process, the ascending and descending loop in the hierarchy of the six layers of the neocortex.

Lacking a criterion for the differentiation of *neuronal* and *semiosical* processes, which would be a third category, namely a *complementary neuronal-semiosical* object language, I have to confine my explanation to *semiotical* meta language. I see similar concepts among a number of different authors. It seems to me that there is a relation between the concepts of sign processes discussed by Bense (1983: 44, 109) such as *generation*, *degeneration*, and *superisation* of signs and certain neuronal processes such as *connection* and *reconnection*, *weighting* and *reweighting* mentioned by Seung, and the ideas of selection, creative loops, self-reference, optimization, amplification mentioned by Harth, and finally the idea of prediction mentioned by Hawkins und Werth.

I see a link between connection and reconnection and generation and degeneration, between supramodal higher-order zones, selection and loops, and superisation, between weighting and reweighting of neurons within interactive patterns of cell assemblies or synaptic chains, and the starting point of consciousness. Weighting and reweighting is crucial for prediction and decision making. Decisions may not always be conscious, nonetheless, they are volitional. Decision-making includes deliberation, and deliberation implies intention and understanding. According to Hegel, sometimes it may be necessary to negate what we have understood because understanding is not always reasonable.

Reason as the epitome of the conscious mind, particularly amplified and optimized cognition, may be what Peirce meant by defining the “*ultimate* logical interpretant”, which “is of a general application [...] [...] a *habit-change*; meaning by a habit-change a modification of a per-

son's tendencies towards action, resulting from previous experiences or from previous exertions of his will or acts, or from a complex of both kinds of cause." (Peirce 1960: CP 5.476)

EXISTENTIAL SEMIOTICS

COMPOSING GESTURE-TOPICS: A SEMIOTIC APPROACH TO VILLA-LOBOS' AFRICAN FOLK DANCES

Cleisson Melo
Universidade Federal da Bahia, Brazil
son.bass@gmail.com; cleisson.melo@helsinki.fi

Abstract

One of the most important Brazilian composers, Heitor Villa-Lobos has developed a remarkable creative and exuberant language. Understanding his style, ideology, technique, strategies, and so on, remains a challenge. This paper is concerned to offer a reconsideration about Villa-Lobos' music and its relationship with the Brazilian musical hybridism to identify the use of the Brazilian nationalistic elements as a step to realize his compositional ideology.

An existential semiotics-based analytical approach should be a powerful means to highlight Villa-Lobos' compositional ideology, especially to explore of the mechanics of composition and expression in a particular genre known as "dance", in relation to specific Brazilian national and nationalist creative features emerging from his particular creative processes which allows identify cultural-musical signs into the Brazilian orchestral music. To demonstrate it, this paper is trying to portray his approach of the use of representative components in his musical gestures writing as sound movements provided with meanings through cultural experience, via the analysis of the first movement of *Danças características Africanas* (African Folk Dances). This music was one of the first attempts to conduct to the "musical miscegenation" in the way to building the "*alma brasileira*" (Brazilian soul) as the Brazilian musical language of concert.

1. Introduction

One of the most important Brazilian composers, Heitor Villa-Lobos (1887–1959), developed a remarkable creative and exuberant language. In general, his music is associated with the emerging nationalism of Brazil in the turn of the 20th century. Nevertheless, understanding his

style, ideology, technique, and strategies remains a challenge.

Villa-Lobos lived in Paris for a few years during the 1920's, his time in Paris provided him a close experience with European modernism and composers. His Brazilian culturally mixed experience associated with the styles and fashions in Europe in those days was significant to the rise of his personal style. Certainly this distinct view of "different" approaches of modernisms gave him tools to influence the modern Brazilian musical language through that cultural miscegenation.

Villa-Lobos' involvement with popular music and folklore of Brazil lent him unaccountable melodies, rhythms, sounds combinations, and so on. This involvement can be clearly noticed in many of his works. This cultural/musical hybridism seems to be relevant to his compositional attitude, since he was engaged with Brazilian modernism and representation of national elements.

Consequently, the strengthening of Brazil's national borders set off discussions about nationalism, national culture, and identities. So, deriving from the diverse social processes that established the roots of Brazilian music, there was a "demand for new theories and critical tools that could cover more subtlety aspects in different contexts" (David 2006: 243). Brazil's diverse soundscape is the framework that fomented the search for the *ethos* of the Brazilian musical aesthetics.

However, some questions need to be addressed. What legitimizes a Brazilian musical aesthetic? Does the compositional process adopted by Villa-Lobos follow a formal aesthetic or set of rules? Does the national imaginary (and symbolic negotiation of it) follow a unique ideological form within the compositional process? Is there a way to keep a "central signification" (Debrun 1990: 39) in Brazilian musical discourse? Regardless of the uncertainty suggested by these questions, it is difficult to deny that there are sound traces in Brazilian music that help identify it as Brazilian musical language (signs).

Identifying national markers in music is certainly a complex endeavor. Following the proposition by Paulo Salles (2013), "national" can be defined as "marked", while "no-national" or "universal" can be classified as "unmarked". So, "precisely in this asymmetry lies much of this embarrassment with correlating 'non-nationalism' to the Villa-Lobos style, with trying to understand his peculiar borrowings of modernist European gestures through the bias of Brazilian modernism. It is worth pointing out that this difficulty is not inconsiderable when somebody tries to define what is 'national' in music" (Salles 2013: 685–686).

On the other hand, dances represent an important cultural component in Brazil. In Brazilian folklore, dancing is directly linked with tradition and culture. As an essential element of folklore, it could be understood as a strong expression of a nation and its culture. In particular, research about Brazilian orchestral dances holds great promise. Yet until now a critical study of this repertoire has been minimal. Thus, to investigate Villa-Lobos' dances should clarify his "musical miscegenation" as his way to building the *alma brasileira* (Brazilian Soul), i.e. the Brazilian musical language.

An analytical approach based on existential semiotics shows the processes, strategies, and ideology of Villa-Lobos, especially if one explores the mechanics of composition and expression. However, applying this approach to specific Brazilian national or nationalist features – emerging from his particular creative processes – will allow us to identify cultural-musical signs in the Brazilian orchestral music. Thus, this paper aims to portray Villa-Lobos' gestural writing as the construction of representative elements and meanings through *Danças Características Africanas* (African Folk Dances), focusing in the first movement of it.

2. African Folk Dances and Brazilian Music Galaxies

Danças Características Africanas was originally written for piano solo between 1914 and 1915,

and orchestrated by Villa-Lobos in 1916. This work is one of the first steps of Villa-Lobos to develop his own style. According to Villa-Lobos, melodic material was taken from a community of Africans and Indians – *Índios Caripunas* from Mato Grosso, the west-central region of Brazil.

This piece has three movements. They are nominated as 1) *Farrapós*, subtitled as Indigenous Dance no.1 – Young People's Dance; 2) *Kankukus*, subtitled as Indigenous Dance no. 2 – Elder's Dance; and 3) *Kankikis*, subtitled as Indigenous Dance No.3 – Children's Dance.

The piece was first performed at the *Semana de Arte Moderna* (The Modern Art Week) in 1922. That international event held in São Paulo was extremely relevant in outlining Brazilian language of modernism, which included literature, plastic arts, lectures, music, and poems. Villa-Lobos has used an octet version of that music. Despite contrary criticism, African Folk Dances has had an impact because of hybridism and non-conventional language. With no doubt, African Folk Dances marks the beginning of Villa-Lobos' disruption with the "conventional" style in the sense that it develops his own creative style.

As it is well known, Brazilian music is based in three distinct influences; African, European, and Native Indigenous. First of all, we must consider those influences, through an imagery dimension of three distinct galaxies. This viewpoint by Paulo Costa Lima (2011) gives us a wide and deep perspective of this "kaleidoscope of matches and mismatches, small and big bump" (Lima 2011: n.p.). The "fusion" process was not established in order to melt one in another, but in the way to administer tensions among them in the same space, i.e. universe. So, "the gradual emergence of something different, perhaps a kind of synthesis that the discourse on national attempts systematically to capture from the 19th century" (Lima 2011: n.p.).

In addition, this tension administration involves a power relationship. Considering the "cultural power" of European colonizer, the competition for space (and symbolic forces) puts the other two galaxies at a disadvantage. The European galaxy had the power – the enslavement of black people and elimination of indigenous societies. On the other hand, we should consider that these "gravitational pull" happened on Brazilian universe. Considering that the African cultural presence has made Brazil as a society, or in other words, it was developed in the Brazilian universe, African cultural presence cannot be considered something external, but an important element in the rise of Brazilian culture.

Thus, despite the colonizing power, all attempts of representations will bump to the African galaxy. At the same time we have a paradox; the desire of the colonized in being like the colonizer. This otherness negation is a (probably necessary) paradox in the construction of a collective ethic; based on the combined overview of all interests.

However, to understand African Folk Dances in this context and the framework demonstrated above gives us a different, wide, and deep perception of the distinct elements approached by Villa-Lobos, which we will discuss later.

3. Musical Gesture

Studies around musical gesture have grown during the last decades and issues involving it are not new. There are many approaches to musical gesture (Lidov 1987; Hatten 2004; Souza 2004, 2009; Gritten 2006; Iazzetta 2007; Kühn 2011; Zbikowski 2011) and, no matter the context, there is no formula or closed units to be applied. Research about musical gesture is not systematic, but it is significant to the development of musical signification grammar. In this sense, semiotics applied to musical gesture has been extremely beneficial to draw an analytical tool.

Considering the connection with movement, we should avoid generic associations with physical gestures or tied to a formal function in music, such as opening and closing gestures (Chaplin 1998). On the other hand, gesture is more than movement, "but a movement which can express something" (Iazzetta 1997: 03). Following this viewpoint, we can point out the stud-

ies of Zbikowski, Köhl, and Greimas as noteworthy contributions to the approach of this paper.

Zbikowski (2011) has developed his metaphor and music theory of communication-based gesture comparing physical gestures accompanied by speech with the musical grammar. Likewise, Köhl points to “gestalt perception, motor movement and mental imagery” (Köhl 2011: 125). As a result, these approaches place us in a position to understand gesture as a directionality agent. In the music context, gesture is a conductor of the expression of the composer. In other words, in the compositional field, gesture is a strong manipulation attitude, even if we consider temporality, signification, narrative, continuity, and so on. In this way, we can claim that gesture is a means to clarify compositional attitude through musical narrative. It could directly correlate with cultural experience.

On the other hand, Greimas (1987) demonstrates a distinction between natural and cultural elements in a semiotic system through gestural system. His approach points out to gesture as “substance” of body movement. Not so far from the music context, gestural sense lies in the perception of directionality; an idea of intention.

At the same manner that natural gesture – a natural phenomenon, as a motor motion – is based on physical movement; learn, develop, and transmit it is a social-cultural phenomenon. In this sense, the transformation of natural gesture into cultural gesture can provide us different typologies of culture – typology of socialized gesticulation, especially if one wants to explore a specific culture or composer.

According to Greimas, the signification of the word *meaning* is understood as referencing or direction – referencing as code of expression and code of content, and the latter as intentionality. In his viewpoint, intentionality establishes a relation between “the itinerary covered and its end points” (Greimas 1987: 27). Thus, it could be applied in the music context as well, approaching composer’s intention and compositional thought. Therefore, it is possible to realize gesture as a directional element of intention of composer within his cultural experience, i.e. a temporal construction of directionality.

This temporal construction manipulated through the continuum can be “modalized”. It allows gesture to bear and convey meaning and semantic gesture in modal categories can create a particular sense effects in the musical discourse. These modalities act on the value of object in sense to “affect the modal existence of the subject” (Fiorin 2007: 04). Furthermore, to understand that the value applied to an object/sign is in its representative value and also in its relation to other sign/object could provide a web of connections in a musical work. Those connections, based on the values applied to a sign, offer coherence and directionality to the musical flow.

In this manner, gesture as a sign may be relevant to the structures of production of values. It can be understood as representative values used by composers. Compositional attitude of composer reflects, in this way, representations of socio-cultural experience in discourse. Thus, one can say that representative values seem to be fragmented. Nonetheless, from this strategic manipulation and segmentation of the continuum emerges the notion of intentionality, which increase the significant character of gestural syntagma. On the other hand, based on the modality semiotic concepts, these apparently fragmented ideas are elements of narrative tied to the form of music and production of values.

As production of values, musical gesture can be significant in the process of figuring composer’s identity embedded of ideology and attitudes. In the same manner, the values produced are fundamental in the determination of discourse modalities.

Even considering that gestural units cannot constitute a signifying system, as linguistic system is, what determines the identity of an object is its value and the opposition relation maintained with other objects. Thus, according to Greimas gesture is incorporated into the communication process and transformed into autonomous codes. Therefore, it reacquires mythical contents es-

establishing a “functional organization and narrative, which control the musical discourse, from the music compression as mythical communication” (Souza 2009: 297).

4. Villa-Lobos and Existential Semiotics

Despite the great number of distinct analytical approaches to Villa-Lobos' works, understand his style, strategies, and compositional process still a challenge. Besides, it is very difficult to portray a wide framework of Villa-Lobos' work. His musical language is not systematic, but it is probably connected to his expressive impulse, cultural experience and personality.

Considering that music semiotics can embrace a wide range of approaches, existential semiotics opened a new paradigm in the analytical studies of signification and communication. “Semiotics is in flux” (Tarasti 2012: 71), studying the sign in movement and flux gives us new possibilities to understand compositional attitude and process. Knowledge provided by existential semiotics opens new horizons to demonstrate Villa-Lobos' gestural and compositional process/attitude, especially through cultural experience and ideology.

As known, the existential semiotics combines *Moi/Soi* (individual and collective subjectivities). “It portrays semiosis not only as a movement of the collective Hegelian spirit” (Tarasti 2012: 29), but even musical gesture, energy, process, attitude, ideology, and so on. Following modalities concepts as processual concepts, analyzing Villa-Lobos' works based on existential semiotics could provide significant tools to understand Villa-Lobos style and process from another viewpoint. In other words, it is possible to reveal some new clues about Villa-Lobos compositional process in the building of the Brazilian soul.

Thus, in the Z-model (figure 1), M1 is primary kinetic energy, the corporeality, desire, body; M2 is identity, personality, habit; S2 is social rules, practices, topics; and S1 is values, norms, general codes.

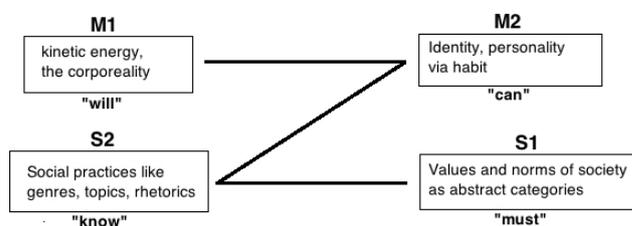

Fig. 1: Tarasti's Z-model – *Moi/Soi*.

Applying it to Villa-Lobos, M1 is his primary corporeal rhythmic and kinetic experience, phenomena, elements, his basic rhythmic entities; M2 is all the primal rhythms and gestures as developed into his personal manners and habits; S2 is genres, topics, and so on, representing the rhythmic social experience in Brazil – in this cases dances; and S1 is Villa-Lobos' aesthetic – rhythm as one of the basic elements, slow-fast, and so on.

With regard to disclose the compositional attitude/process, a compositional theory probably is a good way to that. Lima (2011b) has investigated Lindembergue Cardoso's¹ (1939–1989) work and pointed out to the articulation of a compositional theory through his composition teaching process. Based on Cardoso's notes, Lima shows four points of his compositional practice: “compose what”; “with what”; “for what”; and “why?”. According to Cardoso, that process is in order to place students to face their choices. This theory (process) exemplifies the compos-

¹ Lindembergue Cardoso (1939–1989) was born in Bahia/Brazil. He was one of founders of *Grupo de Compositores da Bahia* (Bahia Composers Group) – important movement in 1960's and 1970's, which was concerned to musical education and disseminates contemporary music. Cardoso composed a great number of music in distinct genres and developed an important approach about teaching composition.

ing ways (“with what”) based on creative process (“what”), dimension (“for what”), and indefinitions/answers (“why”) (Lima 2011b). Crossing this theory and existential semiotics should provide tools and means to demonstrate compositional attitude, gestural, and process (figure 2).

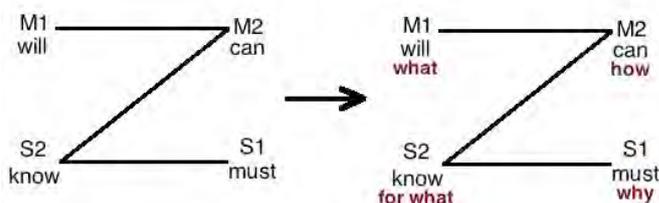

Fig. 2: Z-model and compositional theory.

Considering the simultaneity of events in music (sound), communication between *Moi* and *Soi* happens in different dimensions and directions. Through the theoretical framework demonstrated above, this intersection (IS) (figure 3) should be understood, in this case, as Villa-Lobos’ compositional ideology. In other words, horizontal and vertical aspects of music, divided in distinct layers and dimensions, could be evidenced in order to reveal some aspects of Villa-Lobos compositional process.

Fig. 3: Moi-Soi – communication/intersection.

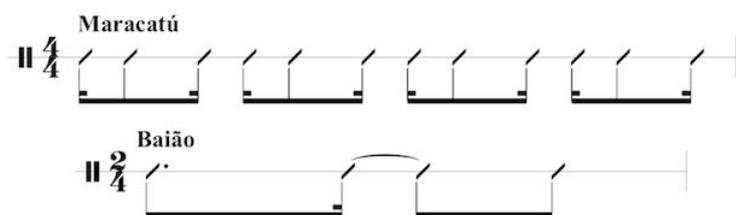

5. Analyzing

A very expressive gesture is presented in the opening of this piece (example 1). This textural gesture carries a communicative and semantic load through the range of the orchestra. It was articulated in order to keep enough energy in this short time. The energy accumulated is directed to reinforce the beginning of the theme. It provides a powerful communication and semantic load through manipulation of continuum. This gesture illustrates Villa-Lobos’ compositional strategy (attitude) – directionality and expression. An idea of directionality and intension is very clear, reinforcing the beginning of theme – since theme stars with just one note. In a linguistic-narrative way it could be seen as a pointing gesture. Villa-Lobos is intentionally pointing and directing to reinforce the theme through this textural gesture. Thus, Villa-Lobos’ gestural attitude is strongly communicative and expressive – personal style.

Example 1: African Folk Dances, 1st Mov. mm. 01–09.

A quick check throughout the score of African Folk Dances, the first thing one can notice is the rhythm. The emphatic rhythm, and strategies of repetitions evoke the communality sense to this piece. The principle of communality, strategies of repetitions, and construction of temporality are reflected on the careful treatment of the emphatic rhythm. One can say music is “time architectures”, and actually it is (Lima 2011a). Villa-Lobos used it perfectly, approaching the rhythm in a widely way more than simply beats or patterns, covering the whole of music – constructions of temporality.

Example 2 shows African-rooted rhythms present in this music. They carry influences of Brazilian popular music – *maracatú* and *baião*. It reflects Villa-Lobos personal experience and identity.

Example 2: Rhythms: Maracatú and baião.

Thus, an african-based rhythmic construction keeps traces of communality, especially through strategic repetitions. *Moi 1*, the kinetic, the corporeality is embodied by those rhythmic strategies. This supposedly rhythmic symmetry reflects the representative communality tied to Villa-Lobos identity and personality (*Moi 2*). The “primal rhythms” and gestures are developed into his personal manners and experiences. The strategy of repetition adopted by Villa-Lobos could be quite predictable, but on the other hand it keeps the communality and sometimes it contrasts with harmony. This compositional attitude is demonstrated by example 3. This gesture is a clear demonstration of Villa-Lobos’ intention of using rhythmic repetition as compositional strategy in the construction of his discourse. Villa-Lobos is using his personal experience to denote the African environment and communality in this music. At the same time it sounds very Brazilian.

The image shows a musical score for four staves. The top staff is in treble clef with a 2/4 time signature, starting at measure 25. It features a melodic line with dynamics *p*, *mf*, and *sf*. The second and third staves are in bass clef with a 2/4 time signature, featuring a rhythmic accompaniment with dynamics *ff* and *p*. The fourth staff is in bass clef with a 2/4 time signature, featuring a harmonic accompaniment with dynamics *p* and *mf*. The score includes various musical notations such as slurs, accents, and dynamic markings.

Example 3: African Folk Dances, 1st Mov. mm. 25–28.

Social experience of Villa-Lobos (*Soi2*) is represented by this “popular influence” and in the superposition of different layers of rhythms and gestures. It results a rich Brazilian rhythm with African influence in the main plan.

This rhetorical representation is evidenced in example 4. The melodic material (2nd staff) is reaffirmed by repletion. *Baião* rhythmic figure is in the percussion section. The triple figure, in

this context (3 against 4 or 2), expresses the African genre and topic into this music. Nonetheless, this figure is not in the piano score, this insertion of “new material” suggests that Villa-Lobos’ compositional attitude was intentionally influenced by his social experience. The values represented are tied to the musical narrative and Villa-Lobos’ social and cultural experience. The elements of musical gesture are significant in the compositional process embedded of his ideology and attitude. Thus, the mythical load works to organize the narrative and establish a communicative musical discourse.

At the same time, the representation of the indigenous is demonstrated by apparent simplicity of thematic material (primitive aspects). Villa-Lobos strategically uses the indigenous element represented by “primitive aspects/elements”. Taking into account the Brazilian mix culture (galaxies), example 4 is a good demonstration of the balance among those “galaxies”. This representation is strongly supported by Villa-Lobos’ social-cultural and personal experience (*Moi2-Soi2*) and conducted by his personal style (*Soi1*).

One significant aspect to be considered is the representation through different layers. It is a good demonstration of intersection of *Moi-Soi*. It indicates Villa-Lobos’ intentional discourse in the sense of balancing those “gravitational pulls” among the galaxies of Brazilian universe.

Example 4: African Folk Dances, 1st Mov. mm. 34–36.

In this blended *Moi* and *Soi*, the apparent triumph of *Moi* has been shown by the seduction of the rhythmic appeal, the emancipation of the rhythm. The rebellion of *Moi* against *Soi* is controlled breaking tonal expectations and delaying resolutions. Harmony acts dynamically as answer and question. Villa-Lobos uses some modal modifications and especially the whole-tone scale to expand and delay the resolution, breaking the staticity dominant-tonic.

Example 5 shows the whole-tone scale, procrastinating resolution and expanding the tonality. It breaks the “predictability” of the rhythm and the dominant-tonic resolution. This staticity of non-resolution harmony over the communal aspects of the rhythm introduces unpredictable elements into this music.

Example 5: African Folk Dances, 1st Mov. mm. 102–105.

This distinguished texture is relevant to the discourse of this music. The gesture is turning the sign in another communicative direction. It is indexing the communicative and representative energy to lead to other musical material and draw the attention of the listener. The musical gesture is carrying enough energy to communication and meaning.

However, that gesture works in order to balance internal forces through tonal and rhythmic expectation breaking. At the same time, that communicative-narrative gesture highlights the coherence of Villa-Lobos' compositional and choosing process. The linearity within the continuum leads to the corporeality embodied by those rhythmic strategies. The approximation of subjectivity and objectivity of this gesture narrows the narrative regarding to musical making.

6. Concluding remarks

Understand Villa-Lobos' style still being a complex endeavor. Thus, "the notion of identity followed by Villa-Lobos would not be an essence to be discovered, but the construction of a sense" (Souza 2010: 196). In this sense, this paper attempted to show, in parallel with the musical grammar, gesture as a compositional strategy; part of the composer store of intonations. In the same manner, faced with different analytical approaches to Villa-Lobos' work, existential semiotics could be extremely significant to reveal "new points" about his music and style.

Through the theoretical framework demonstrated above, in "the light" of Tarasti's existential semiotics, it could be possible develop an analytical tool to track Villa-Lobos' compositional process, attitude, and personal style. Probably, identify a specific style would not be possible, but a unique style in some pieces. In other words, this analytical approach could show some peculiar aesthetic and style of Villa-Lobos in African Folk Dances.

TOWARDS A UNIFIED CONCEPTION OF THE LINGUISTIC SELF WITHIN THE FRAMEWORK OF SEMIOTIC PHENOMENOLOGY

Elżbieta Magdalena Wąsik
Adam Mickiewicz University in Poznań, Poland
wasik@wa.amu.edu.pl

Abstract

This paper focuses on the human self as a member of a society and an active participant of observable interpersonal and assumable intersubjective collectivities in relation to its linguistic and communicative properties. Making use of the notion of the self originating in the philosophical works of Charles Sanders Peirce (1839–1914), William James (1842–1910) and George Herbert Mead (1863–1931), it opts for explaining the nature of self-consciousness in terms of the duality of its manifestations in the mind. Accordingly, it treats the human self as (1) the subject (or the *I* who experiences, thinks, and speaks), and (2) the object of his or her own experiences, thoughts and utterances (or the *me* as a physical person). By the way, attention will be paid to the fact that, regarding the specificity of particular languages, the distinction between the mental subject and the physical person expressible in English does not make sense in the same way, for example, in Spanish, Portuguese or Italian where one speaks rather about twofold qualities of an ego, i.e., corporeal-empirical and subjective-rational. Thus, with regard to sending or receiving and understanding or interpreting activities of communication participants, one refers to intercorporeal and inter-subjective relationships among them. To end with, one must emphasize that the notion of the self as such is not fully mutually translatable from one language into another and has different connotations, for example, in English, German and Polish.

All in all, the aim of this paper is to report on steps of its author's reasoning which allowed her to propose the notion of the linguistic self approachable predominantly, if not exclusively,

from the viewpoint of the significative-communicative acts performed by humans in their life-worlds. Thus, the paper will expound on selected philosophical outlooks on man and his mental endowment responsible for the emergence of language. In particular, the subject of deliberations will constitute such terms as conceptual and methodological tools as (1) the ecology of organisms from biology, (2) existence and transcendence from phenomenology, (3) the distinction between the physical and logical domains from human linguistics, and (4) forms of beings of the subject and modalities of their expression in verbal and nonverbal means from existential semiotics.

1. Introductory remarks

This paper discusses foundations of a positivistic conception of the human individual from the perspective of self-oriented studies. It focuses on the self in relation to its linguistic and communicative properties as a member of society and an active participant of observable interpersonal and assumable intersubjective collectivities. Making use of the notion coming from philosophy and psychology, it explains the consciousness of the self in terms of the duality of its manifestations in the mind. Accordingly, it treats the human self as: (1) a mental subject, i.e., the *I* as an internally conceivable experiencing agent who formulates and interprets his thoughts in sign patterns, (2) a physical person, i.e., the *Me* as an externally observable object of experience who sends and receives its messages through sign practices.

The aim of this paper is to convey a report on reasoning steps which has allowed the author to propose the notion of the linguistic self approachable from the viewpoint of its significative-communicative acts performed in the domains of its everyday life. In expounding on selected outlooks on the species-characteristic endowments of man responsible for the emergence of language, it exposes particularly the notions of (1) ecology derived from biology, (2) existence and transcendence – from phenomenology, (3) physical and logical domains of communication – from human linguistics, and (4) forms of beings of the subject and modalities of their expression in verbal and nonverbal means from existential semiotics.

2. On the linguistic faculty of humans

Whenever issues of the relationships between language and man, language and thought, and of the approachability of language in social interactions are under consideration, it is right to note that the emergence of the linguistic faculties of humans goes hand in hand with their intellectual and emotional growth. This ascertainment clearly follows from scientific evidence provided, *inter alia*, by such contemporary scholars and researchers as especially Tomasello (1999, 2003, 2008), Hauser, Chomsky, and Fitch (2002), Jackendoff (2002), Jackendoff, Pinker (2005), Pinker (1994, 2002), Pinker, Jackendoff (2005) and others, regardless of to what degree they acknowledge genes or the environment to be decisive factors in the development of language. To be precise, some psychic, cognitive and interpersonal abilities in conjunction with language skills cause that human individuals are aware of their own knowledge, beliefs, attitudes, preferred values, desires, goals and intentions. Moreover, as it results from arguments set forth by respective authors, it is exactly thanks to linguistic abilities that human individuals, on the one hand, realize the non-identity of their own mental states with the mental states of others, and, on the other, are capable of sharing intentional states with others as well as ascribing their mental states to other individuals.

Taking up the topic of the human self in the context of the study of language and communication, it is worthwhile remembering that language may fulfill manifold roles in relation to a human individual. For example, Joseph A. DeVito, an American scholar whose books on interpersonal communication have appeared since 1970s, maintained, with reference to func-

tions of language distinguished by Roman Jakobson (1960), that languages, acquired through social interaction allow human individuals to develop speaking skills and that their use results not exclusively from pure communicative matters but is conditioned by culture. DeVito (1976: 34–36) pointed out that human communication, when looking from the point of view of higher needs of its participants, serves to stimulate thoughts, to provoke questions, to entertain others, to reinforce or to change attitudes and to change the behavior of others. It is thus understandable that human beings, distinguished by their capacity for acquiring and using natural languages try to understand and influence their environment, for example, in the domains of philosophy, religion, art and science. In fact, symbolic communication constitutes a prerequisite for the emergence of society based on shared norms and values where individuals realize their roles in the domains of everyday life.

Against the background of statements characterizing language as a human faculty, theoretical distinctions and concepts, which have paved the way to the crystallization of the notion of the linguistic self, deserve a more detailed explanation. They have been elaborated by representatives of disciplines focusing on man and his broadly understood conditionings, such as ecology, studying interactions of living organisms with each other and with their environments, phenomenology, interested in the nature of human consciousness and experience, human linguistics, treating language as a relational property of communicating individuals and existential semiotics dealing with semiotic processes of human subjects who cope with their being in the world through the rational acts of consciousness.

3. The ecology of biological organisms vs. human ecology

Interests in mutual relationships between communicating individuals and their environments bring to mind the ecological way of reasoning rooted in the naturalist heritage of Ernst (Heinrich Philipp August) Haeckel ([1866]1988). As has been pointed out by Wąsik, E. (2010: 75), the term *ecology* referred initially, according to this German biologist and philosopher of evolution, to the studies of the relationships existing between organisms and their environments. Subsequently, it became popular in the domain of sociological studies concerned with the spacing and interdependence of people and institutions. The idea of “human ecology”, initiated by Robert Ezra Park and Ernest Watson Burgess (1921), was propagated by Amos H. Hawley (1950). It should be added that the word *ecology* connoted also the care for endangered species or for the purity of the environment in which living systems function. And more importantly, in the 1970s practitioners of linguistic studies, especially Einar Haugen (1972), put into use the term *ecology of language* with reference to a neutral understanding of the German term *Ökologie* coined in 1866, which has been further elaborated, e.g., by Wąsik, Z. (1993a, 1993b) and Wąsik, E. (1999a, 1999b) (see more Wąsik 2010: 75–76).

The notion of the ecology of language has been defined in Wąsik, E. (2010: 75–79) as a domain dealing with extrasystemic conditionings of language or extralinguistic properties of languages spoken and understood in human communication. As it turned out, specifications of the so-called ecological variables which determine the functioning of languages in societies led ultimately to interests in their speakers. According to Haugen (1972), the real ecology of language constitute minds of monolingual or multilingual individuals interacting with each other as members of particular speech communities. Thus, as has been stated by Wąsik, E. (2010: 76), languages depend on people who realize their communicational tasks speaking them. Therefore, external conditionings of verbal forms of communication are factors taken into account by representatives of contact linguistics, sociolinguistics, discourse analysis and other domains of study. The assumption that the crucial part of the ecology of language constitutes the ecology of language bearers is thus equal to the statement that the only active subjects in linguistic communication are humans as organisms, mental subjects and agents in social encounters.

4. Transcendence and existence as key concepts of phenomenology

Since conscious states of human minds experienced from the first-person perspective are decisive for human action, a way to understand psychological aspects of human communication is to refer to phenomenology concerned with philosophical studies of consciousness. One has to mention that it is things as they appear in human experience, or ways of how human individuals experience things and the meanings of them which have been called phenomena in keeping with the distinction made by Immanuel Kant (1781) between *noumenon*, i.e., ‘the thing-in-itself’ existing beyond human cognition and *phenomenon*, i.e., ‘the-thing-for-us’ existing as appearances of cognized reality. It was, however, Georg Wilhelm Friedrich Hegel (1773/1807) who first had applied the term *phenomenology* to describe the nature of experiential reality in his *Phenomenology of spirit* (rendered also as *Phenomenology of mind*), with reference to the distinction made by Kant (cf. Phenomenology online 2014). From among representatives of phenomenology in the 20th century, one has to enumerate here especially Edmund Husserl, the author of *Logical investigations* (1913/1900) and *Ideas pertaining to a pure phenomenology and to a phenomenological philosophy* (1913), Martin Heidegger, the author of, *inter alia*, *Being and time* (1927), Maurice Merleau-Ponty (1908–1961), the promoter of embodied cognition and the author of *Phenomenology of perception* (1945/1944), Jean-Paul Sartre (1905–1980), the author of *The transcendence of the ego* (1936–1937), and *Being and nothingness* (1943).

These philosophers paid attention to conscious experiences of human individuals, realized by senses from a subjective viewpoint. They tried to get insight into subjective experiences, sensual perceptions, thinking and feeling of humans. What results from the phenomenological approach to man in which the intentional attitude is an inseparable component of experiencing, all human experiences are directed toward things in the world. Consciousness, being always the consciousness of an object, even if the object does not exist in reality, is, according to the proponents of phenomenology, always intentional.

The notions of transcendence and existence refer to two ways of practicing phenomenology. The transcendental phenomenology, concerned with knowledge and cognition, must be characterized as phenomenology of consciousness. It exposed the notion of the transcendental ego, in the consciousness of whom and thanks to consciousness, the being of things was made possible. The notion of transcendence in the study of phenomena was referred, just by Husserl, to the method which he called eidetic reduction. By its means, eidetic or invariant aspects of phenomena as appearances of things should be explained and described with reference to the intentional structure of consciousness of an individual. He postulated an explication of how the meanings of things were constituted by consciousness in consciousness through procedures of reduction and constitution of meaning of which phenomenological reflection consists. While the transcendental reduction amounted to withdrawal from the natural attitude and from the everyday world toward the intersubjective level of the transcendental ego, the constitution of meaning amounted to the return to the world from consciousness as it shows itself in consciousness.

Admittedly, even though Husserl initially insisted upon describing acts of creating the meaning of things performed at the ideal level of a transcendental ego, phenomenology has exposed immediate experience as a source of knowledge and appreciated the role of the human body in shaping mental representations. While this initial phenomenological inquiry of Husserl was the search for transcendental essences and a description of the way how phenomena are constituted in and by consciousness, existential phenomenology was concerned with being and experiences lived by human individuals in their life world. The turn toward existential aspects of experiencing was observed in the philosophy of Heidegger and Merleau-Ponty, but also Husserl opted for including the notion of the life world of everyday experience in the phenomenological consid-

erations in his last work *The crisis of the European sciences* (1970[1956{1935–1936}]). Heidegger and Sartre believed that human individuals create their own values and determine the meanings for their life through acts of consciousness, subscribed, however, to the idea of the primacy of existence before consciousness. They argued that existence cannot be reduced to consciousness of it, and moreover, that there are also such aspects of existence, or being-in-the-world of which an individual is not conscious.

5. The physical and logical domains of human communication

The terms *physical domain* and *logical domain* borrowed from human linguistics promoted by Victor H. Yngve (1996), an American physicist and linguist, are useful for estimating the agency role of communication participants. In accordance with Yngve's view, what is accessible in the real world is not the language as an abstract system of lexical items but only the people who communicate with each other. Therefore, researchers should depart from the concrete manifestation forms of the linguistic properties of communicating individuals, while studying how they assemble into discursive communities through the realization of shared tasks (as stated in Wąsik, E. 2000 and 2003) as constitutive aspects of human ecosystems formed in the natural and socio-cultural domains of human life (cf. also Wąsik, E. 2010: 75).

Hence, the distinction between the physical domain and the logical domain of communication, including observable and inferable facts as extraorganismic and intraorganismic properties of human individuals, allows practitioners of linguistic studies to apprehend investigative consequences that result from their application (see Wąsik, E. 2010: 91–99; especially 93–94). On the one hand, there are objective facts empirically available through direct testing in actual speech acts, which belong to the physical domain, such as the communication participants as concrete persons, the physical sound waves linking them as speakers and hearers, physical objects and other parts of surroundings utilized by them as relevant for the realization of their tasks. And, on the other hand, there are mentally assumed tasks and the knowledge about the referential value of communicational means they use, which belong to the logical domain being grasped through inferences based on reasoning only. Moreover, human individuals are able to communicate about the nature of things and states of affairs being remote in time and space, which do not constitute parts of their proximate surrounding, or about conceived or imagined facts and this way to transcend or to exceed beyond the boundaries of their current experience.

6. Forms of beings of the subject and modalities of their expression in verbal and nonverbal means as basic concepts of existential semiotics

The nature of the significative-communicative activity of human individuals is explained within the theoretical framework of existential semiotics postulated by Eero Tarasti (cf., *inter alia*, 2000, 2009, 2011 and 2012). Existential semiotics assumes that four forms of being of a subject or stages in its development from the individual corporeal ego, through the individual observer's mental ego and the conceptually potential social ego to the actually role-oriented social ego, are pivotal and decisive for semiotic processes (cf., e.g., Tarasti 2011, especially: 328–329). Respective forms of being are, in Tarasti's model, (1) *Being-in-myself*, the bodily ego, (2) *Being-for-myself*, the ego discovering his/her identity and corporeality via habits, (3) *Being-in-itself*, the ego actualizing or not his/her norms, ideas and values through acts of transcendence while performing his/her institutional roles in socially established practices, and (4) *Being-for-itself*, the ego implementing or realizing his/her norms, ideas and values through the conduct in his/her universe of existence.

Subjective forms of being are manifested in the communicative behavior of human individuals. During their significative activity triggering the creation of verbal signs, values, which are

transcendental, are transformed through the modalities of their expression, indispensable for articulating their positions towards existential reality. Through their utterances in verbal communication, human individuals articulate their attitudes, desires or expectations in volitional, epistemic, deontic and obligational modalities consciously or unconsciously, deliberately or pointless, directly or indirectly. These modalities of verbal expression are also accompanied by gestures and facial movements, prosody, pitch, volume, intonation, etc. One must stress, however, that sign processes appear in the minds of human individuals in consequence of their psychological states. At first the products of these sign-processes have a significative value for their originators and afterwards they may be interpreted to their recipients.

To explain the social behaviors of people including their verbal products, in terms of existential semiotics, it is essential to remember that the acts of human consciousness precede and determine the creation of signs which constitute the representations of internal awareness of the individual's mind pertaining to his/her own subjective states. In view to the fact that human individuals constantly shape themselves through their significative-communicative activity, the subject-oriented semiotics should investigate language along with other semiotic means, such as clothes, dance and music, etc. knowing that the signs convey information about bodily, psychological and socio-cultural conditionings of their creators.

7. On the concept of the self in the study of human communication

The examination of the forms of being of human individuals on the basis of their signs is a complement to how to approach the communicating self from the point of view of its activity. Thus, it should be noted that the concept of the self as such, widespread in philosophy and psychology, which presupposes that a human individual is simultaneously an exceptional and irreplaceable acting subject and the object of his/her own experience who stands in relationships with other individuals and other living beings while establishing and sustaining meaningful contacts with their social and natural environments, had been adopted by American theoreticians of communication already starting from the 1960s. In accordance with definitions delivered by American philosophers of pragmatism, as especially William James (1890 and [1892]1961/2001) and George Herbert Mead (1934), the concept of the self presupposes, if one relies particularly on their particular stances that thinking processes of an individual consist in internal conversations, in which the *I*, i.e., the self as a subject, responds to the *Me*, i.e., the self as an object of experience. By the way, it must be stressed, however, that, due to specificity of particular languages, the distinction between a subjective mental *I* and an objective physical *Me*, expressible in English or French, does not occur in the same way, for example, in Spanish, Portuguese or Italian. In some languages, one has to speak about the twofold qualities of an *ego*, i.e., corporeal-empirical and subjective-rational. Thus, with regard to sending or receiving and understanding or interpreting activities of communication participants, one refers to intercorporeal and inter-subjective relationships among them. One must emphasize that the notion of the self as such is not fully translatable from one language into another and has different connotations, for example, in English, German and Polish.

Alluding to the notion of the self, communication scientists working in the intellectual climate of the American pragmatism (cf., e.g., Barker 1977: 111–132) have formulated general statements pertaining to communicating selves. Basing on their views, one can say that different parts of the self of an individual are activated in the course of communication. Recognizing him- or herself as being separate from the environment but having common properties with other members of the group, an individual behaves stimulated by feelings of which and the stimuli of which he/she is usually aware, and which are discernible by others. Repetitive behaviors, called habits, of which individuals are predominantly unaware, are activated automatically;

they relate to the public and private spheres of the selves. Moreover, reactions of communicators to particular situations reflect their values, i.e., moral or ethical judgments of things being sometimes sources of conflict within an individual and barrier between individuals, their attitudes, i.e., learned tendencies to react positively or negatively to objects or situations, as well as their beliefs, opinions and prejudices, since individuals act according to what they accept as true. The communicative behavior of individuals must be, therefore, considered as resultant from all these factors and dependencies between them, which are not always perceptible by other communication participants or researchers.

8. Concluding remarks

Communicating individuals function within their physical and social environments both, in the physical dimension, as concrete persons who send and receive messages as observable meaning bearers and, in the logical dimension, as mental subjects who generate and interpret messages as meaningful and understandable. Accordingly, the personal *Me* of the self appears to outsiders as an empirically accessible object and the subjective *I* only as an rationally assumable agent. A clue to the self, both a physical person and a mental subject constitutes both verbal and nonverbal signs, but only verbal signs allow to probe into existential problems in the best way, as far as all kinds of signs can ultimately be translated into the signs of natural languages. Languages provide for human subjects a base for expressing the content of their experience at the level of vocabulary and grammar while reflecting their inner thoughts and emotions and helping to describe their own forms of being. To sum up, the obvious truth that natural languages contribute to the formation of linguistic communities, in which the individual selves live, and to determine the ways of their living as social selves in their world of everyday life constructed, shaped and modelled collectively through communication, undoubtedly justifies to use notion of the linguistic self.

SIGNS AND EXISTENCE: THE EXISTENTIAL SEMIOTICS OF EERO TARASTI BETWEEN EXISTENTIALISM, SEMIOTICS AND PHILOSOPHICAL ANTHROPOLOGY

Roberto Mastroianni
University of Turin, Italy
roberto.mastroianni@gmail.com

Abstract

The existential semiotics of Eero Tarasti proposes to explain which dynamics come into play in “states before signs are formed,” or in “existential situations,” in which mankind and the signs are positioned, before they crystallize into forms that can be analysed, classified and studied. This research project is presented as a: *Epistemological choices*; a *new theory of the subject*; a *new aesthetic perspective* and a *new existentialism perspective*. This lectured presents a panoramic vision on the relationship between *signs, existence and transcendence*, which developed as a result of constant philosophizing to establish an “existential clarification” of semiotics. The theory of Tarasti selects existentialism as a philosophic *koiné* and does so by confronting the thinkers responsible for making it famous and identifiable (Kierkegaard, Sartre, Jaspers...) and proposes a semiotic point of view on: the existential condition of humankind”; the “existential states in which the subject and the signs are collocated before being ‘immersed’”; the “relationship of the subject with ‘otherness’ and the world”; and the “ethical and political components of human existence.” *Existential semiotics* can be considered a species of *semiotic existentialism*: a semiotic theory which examines the relationship between existence, possibility, the conditions of existence and semiotic processes. There are various existentialist forms, origins and structures, which can be divided into two broad categories: *ontological existentialism* (Heidegger, Maritain...) and *anthropological existentialism* (Sartre, Levinas...). The highest form of *ontological existentialism* is that which is rooted in the Heideggerian tradition, which stems from *Sein und Zeit* and which refers to the imperfect parallelism between two couples of concepts, such as “existential/existentiell” and “ontic/ontological.” For Heideggerism and post-Heideggerism, “existentialism is the theory of the various possible modes of being, considered

abstractly as pure and neutral *a priori*, indistinct and indifferent to any kind of concrete distinction, even if by nature they also always represent concrete and distinct modes, which constitute the *a priori* foundation of the possibility of concrete, ontic decisions (*existentiell*). Every concrete relationship of the individual is *existential* [...] ... a concrete aspect of their being, conditioned and ontologically motivated [...] by the existentialism of being” (Pareyson, 1950: 219). From this perspective, the concrete problems encountered by the individual in daily life would be “*existentiell*,” while the specific problems of reflecting upon, and serving, existence itself would be “*existential*.” Existential thought could thus only be carried out inside an existence. Its roots would therefore be profoundly “*existentiell*” (Heidegger, 1977 and Pareyson, 1950: 185). Tarasti thus chooses to make his own “extended version” of existentialism: a vision which has more in common with the French-style *anthropological existentialism* rooted in the teachings of Levinas (transcendence) and Sartre (the situation of humankind). The lecturer proposes a philosophical, Semiotic and Anthropological vision on the relationship between “sign” and “existence” in relation to the “existential situation,” which precedes the *formation of signs*, the semiotic construction of the subject.

1. Existential semiotics

In recent years, Eero Tarasti has devoted a good deal of his intellectual energy to trying to outline “existential semiotics.” He does this in order to explain which dynamics come into play in “states before signs are formed,” or in “existential situations,” in which mankind and the signs are positioned, before they crystallize into forms that can be analyzed, classified and studied.

What binds the various versions and the author’s research together is the relationship between *signs, subjects and transcendence*, which developed as a result of constant philosophizing to establish an “existential clarification” of semiotics. In his efforts to produce a new semiotic theory, Tarasti’s choice of field is sound. He selects existentialism as a philosophic *koiné* and does so by confronting the thinkers responsible for making it famous and identifiable (Kierkegaard, Sartre, Jaspers...). The author could therefore seem to be renouncing his own semiotic vocation in order to devote himself to a broader form of philosophic research. This is in part true, but only in part, as this work can be fully incorporated into philosophic contemplations of the status of signs and language and the philosophic tradition of story-telling without seeking to abandon, however, the “sign doctrine,” which is a form of linguistic philosophy.

Tarasti’s theoretical challenge is, therefore, to produce a new “general theory of semiotics,” that will be able to correlate existential issues, by questioning how signs and their meanings are established. These issues include: “the existential condition of humankind,” the “existential states in which the subject and the signs are collocated before being ‘immersed;’” the “relationship of the subject with ‘otherness’ and the world,” and the “ethical and political components of human existence.”

For Tarasti, “reality is made up of *energy fields* governed by specific laws,” of which both the subject and the signs are parts. These are the “situations in which the sign is manifested, given that it is always in relation to a specific, existential situation” (Tarasti, 2009). This perspective expresses a preference for a vision of existence indebted to anthropological readings of existentialism, which are widespread in the French sphere (Levinas, 1998). It rejects post-Heideggerian ontology, presenting existential semiotics as an advanced, but still incomplete, attempt to correlate a possible semiotic reading of the existential condition of humankind in the world, its ethical dimension and the emersion of sign systems, which give meaning to the anthroposphere, and their temporal and spatial dimensions.

2. Semiotic Existentialism: ontological existentialism or anthropological existentialism?

Existential semiotics selects existentialism like *Koiné*. Tarasti refers to existentialist writers. He uses the same vocabulary and discusses issues which are both existentialist and *existentiell*.

At this point, it is fundamental to understand the type of existentialism Tarasti chooses and which he correlates to semiotic traditions. He does so after developing a “general theory of purpose and meaning” that can correlate “existential states of being” to those which precede the appearance of signs and systems of meaning.

From this point of view, existential semiotics are like a “third generation of semiotics” that seeks to surpass both ‘classical semiotics’ (Peirce, Greimas, Sebeok..) and “second generation” semiotics (Eco, Barthes, Kristeva ...).

“First generation semiotics” put forward general theories of purpose and meaning, which served as a backdrop to semiotics of the “second generation,” which sought to elaborate operative semiotic theories, making less complete reference to the texts, sign systems and meanings. “Third generation semiotics” discusses the problem of formulating a new semiotic theory that can correlate the emersion of signs with the nature of the subject, temporality and human spatiality.

Existential semiotics can be considered a species of *semiotic existentialism*: a semiotic theory which examines the relationship between existence, possibility, the conditions of existence and semiotic processes. It is thus necessary to identify the forms and characters of the existentialist calling of Tarasti’s semiotics.

There are various existentialist forms, origins and structures, which can be divided into two broad categories: *ontological existentialism* (Heidegger, Maritain...) and *anthropological existentialism* (Sartre, Levinas...).

The highest form of *ontological existentialism* is that which is rooted in the Heideggerian tradition, which stems from *Sein und Zeit* and which refers to the imperfect parallelism between two couples of concepts, such as “existential/existentiell” and “ontic/ontological”. For Heideggerism and post-Heideggerism, “existentialism is the theory of the various possible modes of being, considered abstractly as pure and neutral *a priori*, indistinct and indifferent to any kind of concrete distinction, even if by nature they also always represent concrete and distinct modes, which constitute the *a priori* foundation of the possibility of concrete, ontic decisions (*existentiell*). Every concrete relationship of the individual is *existential* [...] ... a concrete aspect of their being, conditioned and ontologically motivated [...] by the existentialism of being” (Pareyson, 1950: 219). From this perspective, the concrete problems encountered by the individual in daily life would be “existentiell,” while the specific problems of reflecting upon, and serving, existence itself would be “existential.” Existential thought could thus only be carried out inside an existence. Its roots would therefore be profoundly “existentiell.” (Heidegger, 1977 and Pareyson, 1950: 185). Existential semiotics does not make this distinction itself. Instead, it tends to merge with the broader “existential condition.” As he does not discuss this distinction openly, Tarasti finds himself handling the notion of the “existential condition” imprecisely, in our opinion, not putting forward a “rigid definition” of it. Instead, a “broad version” is loyal to the *post-Sartrean slogan* (“existence precedes the essence”) in which existentialism, as a cultural movement, has long been recognized.

Tarasti thus chooses to make his own “extended version” of existentialism: a vision which has more in common with the French-style *anthropological existentialism* rooted in the teachings of Levinas (transcendence) and Sartre (the situation of humankind).

3. The Subject, Otherness and the Existential Condition

The subject is one of the central themes of Tarasti’s theories. It is analysed in relation to the existential condition which characterizes it, the construction of identity and the otherness, to which transcendence always tends guide the subject.

From this perspective, the relationship between “sign” and “subject” is analysed in relation to the “existential situation,” which precedes the *formation of signs*, the semiotic construction of the subject,” *otherness and the world*. From this point of view, the subject and the semiotic process

are both part of an existential situation which defies the logic of the “equal exchange of pieces of information” and which embraces a more dynamic, open form of semiosis, in which the “subject and the “world” are subjected to constant construction and deconstruction processes.

From this point of view, “existential semiotics” resembles the “interpretive semiotics” of Peirce. It recognizes the subject as a chain of signs and interpretations and the production process as an open semiotic process (*infinite semiosis*). At the same time, this new semiotic theory distances itself from that of Peirce, in terms of its existential, ethical and political interest and its intuitive, informal character.

From this perspective, the sign, the formation of meaning, the construction of the subject and of the method are inserted into a dynamic process which produces identity in relation to otherness. The otherness is a fundamental element of Tarasti’s theory: the “subject” is formed in relation to “otherness” in a type of open, interpretive semiotic process, which displaces the centre of semiotic activity in dialogue between inter-related subjects. The code of this relationship is determined by the existential situation, so it becomes important to understand these states in which signs emerge and codes are formalized. Attention to the spaces in discourse (spaces produced by semiotic practices referred to as discourses) makes existential semiotics a semiotics of communication, which focuses upon the anthropological, existential spatiality produced by meaning processes.

This type of semiotics thus refuses the idea that “communication” is an “equal exchange of pieces of information.” It refuses the “engineering-style model of communication” (issuer, recipient, message, code, channel), instead opting for an “idea of “communicative community”-style communication (language/spatiality/united by communications and speakers who produce a community).

Tarasti refers to the space of discourse/dialogue in the semiotic process as the semiotic construction of the *subject, the world and otherness* – the “existential condition.” He thereby attributes an ulterior meaning to Sartre’s concept of the “existential situation.”

For the author, the “existential condition” represents the totality of “conditions which *precede* the formation of signs; the so-called *pre-signs*” (Tarasti, 2009: 22).

From this perspective, the sign “always appears in relation to a given situation [...] I mean, the situation in which the sign shows itself as its determined, concrete, spatial-temporal position.” In addition, “the sign can be placed in any type of existential relationship with the situation itself. It can negate or affirm it” (Tarasti, 2009: 23). This layout is wedded to an anthropological vision of existentialism, a French-style vision which refers back to Sartre and Levinas.

The “in-situation” sign (as in Sartre) and this “situation” assume a socio-historic and, in some respects, a political tone...Transcendence (as in Levinas) is crucial to constructing the subject, otherness, the world and human relationships. This set-up (as in Levinas) has strong ethical components and recognises the central element of the anthropological dimension in the dialogue.

The rejection of Heidegger’s ontological existentialism thus opts in favour of the application of a French matrix, of anthropological existentialism.

But the refusal of Heideggerism and of his results does not end here. It is not limited to the rejection of a “strict definition” of the term “existential.” In fact, according to Tarasti, the term *Dasein* has been given a “broader” meaning. It has stopped meaning the condition of an individual *being flung* (the *Dasein/to be* Heideggerian *here*) into the world and has become the term with which an “existential phase” is designated, with the socio-historic characteristics from which signs extensively emerge.

From this point of view, transcendence is the desire to surpass realist acceptance of the world as it is and to move towards a political, ethical and planned reality of *subjectivity in semiotic relations with the world*.

4. Existential Semiotics or Existential Hermeneutics

A structure (such as Tarasti's), which recognises the relationship between *the subject, otherness, the signs and transcendence*, as based upon *language/dialogue/discourse* and the *refusal to realistically accept reality*, is like many philosophic, hermeneutic and dialogic structures (such as hermeneutic philosophy, the dialogism of Bakhtin, the thinking of Buber and Gadamer...).

Tarasti's work is ambitious and very interesting, perhaps precisely because it creates short-circuits between philosophy and semiotics, which find more fertile ground on which to express themselves in the triad of *subject, sign and transcendence*.

This perspective should be more explicit in Tarasti's theories. Let us hope it becomes so in a subsequent phase. The author should make the value of *dialogue/discourse* more explicit in the semiotic theory he is developing.

Tarasti, like Gadamer, Arendt *et alia* considers language to be distinct from contemporary semiotics (Volli, 2002 and Volli, 2007). He recognizes it as "*in-between*" the people who speak it. For this reason, the "existential space," or the "existential situation which precedes the establishment of signs," is essentially a spatiality in *dialogue/discourse*.

This perspective would benefit from being developed until extreme philosophic consequences are reached, but Tarasti is not doing this for the time being. If he were to expand his research to cover the relationship between *language, existence, otherness and transcendence*, contemporary Hermeneutic philosophy (Gadamer) would be fused with ontological existentialism (Heidegger) and it is not clear why this is not being done.

In Tarasti's mind, transcendence is an unshakable need for the otherness of the subject. This theory owes much to the theories of Levinas. This concession creates a checkmate situation for a theory of meaning that is too easy. It is based upon an "equal exchange of information," and is evolving into a more complex theory of communication. But Tarasti stops here and does not examine the "existential situation" to an adequate degree, if doing so means embracing ontological existentialism. He should recognise (as Heidegger says): that the *Dasein* is positioned on a linguistic axis; that language is the "opening" through which humankind and the world end up being positioned; that transcendence is an element of existence; and that being (from the Latin term *ex-sistere*, to be outside) is an ontological aspect of humankind. In this way, *existential semiotics* might embrace Post-Heideggerian contemporary thought and intense *dialogism*.

Tarasti's theory on *dialogue/discourse* much resembles Bakhtin's theory of polyphony and is very similar to existential hermeneutics (Heidegger, Gadamer...).

For this reason, the author's refusal of Heidegger's thoughts is difficult to understand. Heidegger's theory on *Dasein* is, in fact, based on a notion of being thrown away, which characterises existence like *ex-sistere* (to be outside and to go beyond reality towards possibility). This idea of transcendence, together with the centrality of *dialogue/discourse* could become the presupposed theory of semiotics, which specializes in otherness, the subject and existence. In this way, semiotics, which seeks to correlate the existential situations that precede the formation of meaning and signs, can find an ally, and not an enemy, in philosophic hermeneutics. This is because Heidegger's being always exists in a situation and location. He or she is not a transcendental subject, but the "human being who has been disposed of" (*Geworfenheit*), a finished, concrete being, who is historically situated, a single, complete existence which corresponds to a certain emotional state and collection of prejudices.

In addition, all the Heideggerian speculation on whether the charter of the sign is "usable" might open up a semiotics that is attentive to the ethical implications of the human condition and to its relationship with otherness, which cannot be reduced to a field of research like an "existential project" that "makes sense" within an ontological opening, made up of language and signs.

This new theory of semiotics with its fruitful intuitions could be strengthened by a more care-

ful investigation of the “worldiness of the world”, which is a “character of the very being” that is constituted through the usability of things and their meaning in our lives. This is because, in the world, mankind (which Tarasti refers to as “the subject”) always organizes itself in relation to its options, inserting them into projects and assuming them as instruments. The character of “postponement” (*aliquid pro aliquod*) of the sign (§17 in *Sein und Zeit*), as a built-in, non-accidental nature, will perhaps be researched in greater depth and thus strengthen the Bakhtinian dialogism of existential semiotics.

For Tarasti, this will probably be the fertile path that will lead to further innovative thinking and which will better reconcile certain perspectives of existential semiotics with post-Heideggerian and post-Gadamerian philosophic hermeneutics.

A SOLIPSISTIC PARADIGM OF NEW SEMIOTICS IN THE LIGHT OF EXISTENTIAL PHENOMENOLOGY AND ANTHROPOLOGICAL LINGUISTICS

Zdzisław Wąsik
Adam Mickiewicz University in Poznań, Poland
zdzis.wasik@gmail.com

Abstract

The subject matter of this lecture will constitute a phenomenological and linguistic typology of significative-communicative properties of man as a semiotic animal embedded in its ecological surrounding of living and non-living as well as natural and artificial systems. Focusing on the semiotic self as an investigative object, new semiotic studies following the solipsistic anthropocentrism are counterpoised to traditional semiotic studies governed by the rules of collective semiocentrism. Instead of dealing with sign- and referent-related properties of communicational products, practitioners of new semiotics are interested in the dynamic properties of human individuals on account of their sign- or meaning-processing activities. This lecture will investigate the difference between animals and humans as to the nature of their subjective universes on the basis of existential phenomenology, philosophy of biology, and biological semiotics. Furthermore, it will take a look on the defining characteristics of speech derivable from the contrast between the verbal and non-verbal means of animal and human communication from the perspective of anthropological linguistics.

Having compared the subjective states of organisms with respect to the absence or presence of intentionality, slave or master relationships, closeness and openness of their environments, existential phenomenologists have argued that animals are bound in totality to their subjective universe and humans may transcend it by going to another kind of reality. As conscious individuals humans are endowed with free will allowing them to change and to shape their world of everyday life. Animal organisms have been described as behaving instinctively and human organisms as comporting themselves with reflection and stance-taking. Semiotically inclined phenomenologists have applied the sign- and meaning-processing-oriented approach to ponder

the existential modes of animals and humans in terms of their being in the world as immanence and being for the world as transcendence. Immanent subjects are regarded as existing in their environments and transcendent subjects as being able to go beyond their universe of life. Additional divergence between animals and humans have been observed in their ego-related awareness of corporeality or intercorporeality and subjectivity or intersubjectivity status and in their conscious awareness of the meaning of being alive and the ability of taking stand to the existence in the surrounding or existing for the surrounding. Considering the organism's relations to the world they live in, it is the matter of becoming in the world and becoming of the world as a result of these relations. Important are relationships of organisms to their environment in terms of how they affect it or how they are affected by it. Organisms differ, therefore, in the potential networks of affective relationships with their environments. In another context of scientific reflections, representatives of anthropological linguistics have derived the species-specific properties of animals and humans, with regard to their communicative means, from: immutability or interchangeability of sender-receiver roles, innateness or experientiality in generational acquisition and transmission, naturalness or conventionality of origin, constancy or variability and stability or changeability, boundedness or displacement ability in time and space, instinctiveness or intentionality, globality and continuity or segmentability and discreteness of patterning, etc.

1. Introductory remarks

The subject matter of this article constitutes a typology of significative-communicative properties of man as a semiotic animal embedded in its ecological surroundings of natural and artificial systems. With the focus on the self as an object of new semiotic studies, the solipsistic anthropocentrism is counterpoised here to the domain of traditional semiotic studies governed by the rules of collective semiocentrism. Instead of dealing with sign- and referent-related properties of communicational products, the article pays attention to the dynamic properties of human individuals on account of their sign- or meaning-processing activities while exposing the differences and similarities between *Umwelt* and *Lebenswelt* as the subjective universes of animals and humans on the basis of existential phenomenology, philosophy of biology and biological semiotics. Furthermore, it takes a look on the defining characteristics of speech derivable from the contrast between the verbal and non-verbal means of animal and human communication in the light of anthropological linguistics.

2. The subjective universe of organisms in the light of phenomenology

The first subpart of this article deals with phenomenological interpretations of differences or similarities between animal and human environments, confronting the notions of *Umwelt* and *Lebenswelt*. The term *Umwelt* 'surrounding world' applied to the subjective world of animal organisms by Jakob von Uexküll since 1909 (cf. 1921[1909]), is parallel to the term *Funktionskreis(e)* 'functional circle(s)', which was added in the second edition of *Umwelt und Innenwelt der Tiere* in 1921, and subsequently also to *Umweltröhre(n)* 'environmental pipe(s)', introduced along with the superordinated term *Umwelttunnel* 'environmental tunnel' slightly later by Uexküll in the second edition of his *Theoretische Biologie* (1928[1920]), cf. Uexküll (1926[1920]). *Umwelt* metaphorically modelled as a "soap bubble" refers to a particular environment of an animal acting at in a "functional circle" (*Funktionskreis*) of medium, food, enemy or sex (cf. Uexküll 1982[1940]: 59–60, especially 71), and *Umweltröhren* (cf. Uexküll 1928: 70, 108) illustrate a sequence of all environmental circles that the individual organism has to pass in a stroll throughout its whole life (cf. Uexküll 1957[1934]).

2.1. Perceptual markers of subjective significance in the universe of animal organisms

Having studied the behavior of animal organisms entering into relationships with other objects from their environment, Uexküll noted that animals, from unicellular microorganisms to

hominids, as living objects endowed with the so-called *Ich-Ton* (i.e., a property of subjectivity, rendered in the English translation of original German terms signifying musical tones by ‘ego-quality’), are capable of discerning meaning from environmental signals. Such meaning is attributable to objects, which possess qualities of being significant for the satisfaction of needs of a cognizing subject, as, e.g., *Weg-Ton* ‘path-quality’, *Wurf-Ton* ‘throw-quality’, *Trink-Ton* ‘drinking-quality’, *Fress-Ton* ‘eating-quality’, *Sitz-Ton* ‘sitting-quality’, *Hindernis-Ton* ‘obstacle-quality’, *Kletter-Ton* ‘climbing quality’, etc. (cf. Uexküll 1982: 27–31).

2.2. The life-world of humans as an investigative object of mundane phenomenology

Another kind of a subjective universe was proposed in phenomenology under the label of *Lebenswelt* describing the pre-given world in which humans live by Edmund Husserl (mainly 1970[1956{1935–1936}], cf., *inter alia*, also 1970[1913/1900/], 1970[1913/1901/], 1970[1913], and especially 2008/1916–1937/). The spherical dimension of human surroundings is visible in Edmund Husserl’s depiction: “In whatever way we may be conscious of the world as universal horizon, as coherent universe of existing objects, we, each ‘I-the-man’ and all of us together, belong to the world as living with one another in the world; and the world is our world, valid for our consciousness as existing precisely through this ‘living together.’” (1970[1956]1935–1936}: 108). This term “life-world”, coming from mundane phenomenology as the translation from the German original by Alfred Schütz and Thomas Luckmann (1973 [1975]), was abandoned by representatives of social constructivism Peter Berger and Thomas Luckmann (1966/1967) in favor of “the reality of everyday life”.

2.3. Ontological-ethological interpretations of the relationships of organisms to their natural environments

How the patterns of these relations that animals have to their *Umwelt* and humans to their *Lebenswelt* or, in general, that organisms have to their natural environments, are interpreted in existential phenomenology is shown on the basis of a comparative study on Jakob von Uexküll’s, Martin Heidegger’s, Maurice Merleau-Ponty’s, and Gilles Deleuze’s onto-ethologies done by Brett Buchanan (1975). In Buchanan’s opinion (1975: 5, 39–114,) contemporary biologists would be disappointed from Heidegger’s division of the beings in the world, in which, for example, the stone has no world, the animal is a captive of the world and the human – a world-forming being.

For Heidegger (1962[1927], 1995[1983]) the existence in the world, named after the German term *Dasein* (*da-sein* ‘being-there’), is a property of humans only. He describes behavior (*Benehmen*) of animals and their *Umwelt* in terms of restrictedness and functional boundedness in comparison to the comportment (*Verhalten*) of human *Dasein*, which is free and unbound in its opening to the world. Animals are admitted to have relations with things through the outward extension of their body, but they are said to lack an access to the things in themselves and to the being of these beings because they cannot transcend their captivity by things.

Recapitulating the position of Merleau-Ponty in his writings, Buchanan (1975) notices that Merleau-Ponty (1943/1938/[1983/1963/], 1945/1944/[1962], 1968[1964]) does not distinguish between various kinds of the world in which organisms live. For him the “environment”, “ambiance,” “entourage,” or “milieu” is a relational structure of organism’s behavior, whereas the organism is to be seen as a functional whole determined by perceptions of its experiencing body. Behavior forms thus a relational enclosure to such an extent that the organism is structurally united with its world.

In Deleuze’s (1992[1968], 1990[1969], 1988[1981/1970/]) philosophy of affections, elaborated after Benedict Spinoza (1883[1677]) and extended in cooperation with Félix Guattari (cf. Deleuze & Guattari 1987[1980]), important are relationships of organisms to their environment how they affect it or how they are affected by incoming stimuli. Organisms are said to differ in potential networks of affective relationships with their social, cultural and natural environments.

3. The theoretical stance of existential semiotics toward the being forms of human individuals

In the second subpart, a search for the roots of existential semiotics launched as a conceptual and methodological framework by Eero Tarasti (2000, 2009, 2011, 2012) starts with rethinking the layouts of human-centered semiotics in the light of philosophers who paid attention to “existence” and “transcendence”. Therefore, it goes back to Georg Wilhelm Friedrich Hegel (1777/1807/[1793/1807/]), who characterized his approach to reality as phenomenology while alluding to Immanuel Kant (1724[1724]), but who, unlike Kant, expressed his conviction that phenomena constitute a sufficient basis for a universal science of being.

3.1. Modes of human existence: Being in itself and being for itself

The main emphasis is put on Hegel’s categories of *an-sich-sein* ‘being-in-itself’ and *für-sich-sein* ‘being-for-itself’, which subsequently turned into subjective and objective being in the philosophy of Søren Kierkegaard (1813[1813]) when he spoke about an individual as an observer of him- or herself or the observed one who was a subject or such an individual who was what he/she was because he/she had become like it. Jean-Paul Sartre (1905/1980/[1905–1980], 1956 [1956]), a skeptical reader of Hegel and Kierkegaard in line, translated Hegelian concepts with *être-en-soi* and *être-pour-soi*. For Sartre, the being as such becomes aware of itself through an act of negation and, when becoming an observer of itself, it shifts its attention into the position of being for itself. Having noticed a lack in its reality, this being begins with the first act of transcendence when it strives to fulfil what it lacks.

3.2. Modality acts of self-awareness in personal and subjective spheres of individual and social manifestation forms

Hegelian concepts of *an-sich-sein* and *für-sich-sein*, have been changed into *an-mir-sein* ‘being-in-myself’ and *für-mich-sein* ‘being-for-myself’ by Jacques Fontanille (2004). Following his contribution to somatic semiotics, one can detach the individual objective and subjective from social objective and subjective being forms of human body (*soma*) in a new phenomenological sense (*séma*), i.e., *être-en-moi* and *être-en-soi* from *être-pour-moi* and *être-pour-soi*.

Fontanille’s distinctions have influenced Tarasti (cf. 2011: 328–329) to classify the corporeal and mental, individual and social modes of human existence and transcendence into four modality acts of self-awareness, having been reconstituted here in a cohesive description as follows: (1) *an-mir-sein* – *être-en-moi* – ‘being-in-myself’, in which an individual is willing to appreciate his/her/its existential bodily self-worth; I represents bodily ego of human self which appears as kinetic energy, expressions of needs, wants or desires through gestures and intonations; (2) *für-mich-sein* – *être-pour-moi* – ‘being-for-myself’, in which the individual can reflect upon him-/her-/it-self while transcending to the position of an “observer”; the attitude of an “observer” shifting, for the lack of his, her or its existence, to the transcendental acts of an ego discovering his, her or its existential identity; (3) *an-sich-sein* – *être-en-soi* – ‘being-in-itself’, in which an individual transcends to probable chances, conveyed by purely conceptual and virtual norms, ideas, and values, which he/she/it must either actualize or not actualize in society; (4) *für-sich-sein* – *être-pour-soi* – ‘being-for-itself’, in which an individual refers to an actual role as realized by the conduct in his/hers/its world of existence, which are determined by aforementioned norms, ideas, and values.

Summarizing postmodern thought on semiotic phenomenology, one can consider the existence modes of animal and human subjects in terms of their being in the world as immanence and being for the world as transcendence. Immanent subjects are viewed as existing in their environments and transcendent subjects as being able to go beyond their universe of life.

4. Semiotic universals of language in animal and human communication

The subject matter of the third subpart constitutes the author’s (Zdzisław Wąsik 2007, and

2014: 65–78) classificatory elaborations and extensions of Charles Hockett's (1959a[1958], 1959b, 1960a, 1960b, 1966[1963]), Stuart Altmann's (1962), Hockett's and Altmann's (1968), as well as Charles Osgood's (1980) approaches to defining characteristics of speech derivable from the contrast between verbal and non-verbal means of communication in the universe of animals and humans. Accordingly, semiotic universals of language have been divided into four groups: (I) form and structure of language; (II) substances of codes and channels of communication; (III) cognitive faculties and communicational abilities of human beings across cultures and generations; (IV) relationships between the signifying and signified sides of verbal means as well as between verbal means and their users (see Wąsik (2014: 72–73).

4.1. Structural-systemic set of semiotic universals of language

Group I embraces systemic properties of language making up domain of linguistics studies, such as: *semantic referentiality* where the semantic function of verbal signs results from their reference to reality and the relation between signs and their referents always repeats in a similar way although always in new contexts; *conventional arbitrariness* – the relationship between verbal signs and their referents is not natural by origin but depends upon the social usage and customs conditioned by free and non-motivated choices; *discrete distinctiveness* – verbal means are not continuous and global but articulated and segmented as mutually distinguishable and replaceable contextual entities, units or constructions; *double articulateness* – verbal means can be divided into the smallest meaningful text elements (morphemes) and smallest diacritic text elements (phonemes); *morphological duality* – verbal means can be divided into two classes of signs, grammatical and lexical morphemes; *bipartite significance* – verbal means as constituents of predication frames can be divided, on the syntactic level, into sentences and word phrases that realize, on the logical and semantic level, both the function of propositions and concepts; *functional and compositional hierarchicality* – on the subordinating level, text elements of lower order function within entities, units or constructions of higher order, as phonemes, morphemes, semantemes, words, phrases, sentences, utterances, discourses and texts, and, on the superordinating level, text elements of higher order consist at least of one entity, unit or construction of lower order, as text, discourse, utterance, sentence, phrase, word, semanteme, morpheme, and phoneme; *binary isomorphism of text structures* – segmental text structures, as syllable, stem, word, phrase, clause, sentence, are isomorphous as to their binary forms consisting of a constitutive component and an accessory component; for a syllable, the constitutive component is a vowel or semivowel, for a stem – a lexical morpheme, for a word – a stem, for a phrase – a determined word, for a clause – verbal phrase, for a sentence – the main clause; accessory, in turn, for a syllable is a consonant, for a stem – a derivational affix, for a word – an inflectional ending, for a phrase – a determining word, for a clause – a nominal phrase, for a sentence – a subordinated clause; *syntagmatic integrativity and paradigmatic commutability* – verbal signs can create entities, units and constructions appearing as segments and/or suprasegmental features; *combinatorial-productive openness* – the system of language functions as an open system, so that its users have the opportunity to produce an infinite number of signs from a finite number of simple elements and phraseological constructions.

The specification of characteristic features of language that belong to the domain of linguistics can lead to the formulation of its semiotic definition when language is confronted with other systems of understanding on the basis of searching for the *genus proximum* of the linguistic sign among the other semiotic objects. Examined on the syntagmatic level of utterances and locutions, both simple signs and composed signs are regarded as complex signs of higher order as to their global meaning, where the sum of their components does not equal the sum of their partial meanings. All meaningful forms as simple signs or composed signs are considered as members of the same paradigm when they replace each other within the same context of locutions and/or utterances.

4.2. Phonic realization of linguistic texts in speech as non-systemic properties of language

Non-systemic properties of language constituting group II should be relegated to the interest of physical acoustics. The object of study is reduced here to non-systemic properties of speech sounds, as follows: *vocal-auditory*, verbal signs have a phonic character, they are emitted through the vocal tract and received by ear; *centrifugal transmission and directional reception* – sound waves expand in all directions, but they are received from that direction in which the listener finds himself; *evanescence in time* – phonic substances of speech sounds due to physical laws are transitory and volatile; *linear integration over time* – receivers apprehend sound waves as a sequence of segments arranged in a line (cf. Wąsik 2014: 74–75).

4.3. Extrasystemic properties of language as an investigative object of the neighboring disciplines of linguistics

Groups III and IV, in turn, pertain to extrasystemic properties of language studied by human-centered semiotics. Group III has been précised in the following order: *interchangeability of sender-receiver roles* stating that the communicating individual who can be both a sender and a receiver of his or her signs and the signs of other individuals can produce, perceive and reproduce their own or foreign signs as many times as they want; *complete (total) feedback* – the sender, while speaking, can not only simultaneously perceive reactions of others, but he or she can also react to the form and content of what they emit him- or her-self, which also gives them the possibility of controlling and/or correcting their errors; *cultural transmission* – languages are not genetically inherited, but generationally transferred through education and participation in culture; *creativity, learnability and forgetability* – as far as speech faculties can be inherited, every representative of the species *homo sapiens*, understood also as *homo animal symbolicum*, can not only acquire every language but also create his or her own linguistic system or forget a given language, which they have learned; *translatability* – the feature of learnability implies also the feature of translatability of every language learned by users as a second, third or fourth, and so forth, language; *conventionally determined changeability in time and variability in space* – bearers of a given language, as members of communicative communities, can contribute, on the basis of social agreement or contacts between different languages or their different varieties, not only to the formation of new but also to mixed languages or their new functional and stylistic varieties as well as new expressions and utterances never heard before in a given language, etc.

Group IV encompasses: *specialization* stating that language has developed to perform various semantic and non-semantic functions; *contextuality* – the meanings of verbal means specify themselves in dependence of environments; *translocation* (displacement) – users of a given language may speak about things remote in time and space; *metadesignation* – a language may serve to speak about the language as an object of reality; *prevarication* – the extralingual reality of verbal signs can be both true and false, observed and inferred, as well as imagined and real, and the like; *pragmaticity* – linguistic utterances can be interpreted directly according to their locutionary meaning or indirectly as exerting an impact upon receivers due to their illocutionary force; *intentionality* – senders can deliberately manipulate with a sense of utterances; *transparency or opacity* – the meaning of expressions are either overt or covert when their receivers understand them immediately or interpret them only through paraphrases; *gestalticity* – verbal means possess a producer-oriented recognizable shape; *fossilization* (lexicalization) – verbal signs strive to become independent from their derivational meanings, motivation or etymology (see Wąsik 2014: 74–75).

Among the most relevant species-specific properties of animals and humans in communication, distinguished in the research on the semiotic universals of language, the following pair of oppositions might be distinguished: immutability vs. interchangeability of sender-receiver roles, innateness vs. experientiality in generational acquisition and transmission; naturalness of signaling means vs. conventionality of origin, constancy or variability and stability or change-

ability of language; boundedness vs. displacement facility in time and space; instinctiveness vs. intentionality; globality vs. continuity or segmentability and discreteness of patterning, etc.

5. Conclusions

To end with, it may be noticed that the ideas of transcendence, displacement, openness and metadesignation, as distinctive properties of humanity, are common for philosophers, psychologists, semioticians and linguists. What is important in the enumeration of differential characteristics of humans in comparison to animals are the convictions of philosophers pertaining, *inter alia*, to the awareness of being alive and taking stand to the existence in the surrounding and to existing for the surrounding, the endowments with the free will allowing to change and to shape the world of everyday life as well as to becoming in the world and becoming of the world as a result of organismic and interorganismic interrelationships.

FOR A SOCIOSEMIOTICS: CENTRIFUGAL AND CENTRIPETAL FORCES

Anti Randviir
University of Tartu, Estonia
randviir@ut.ee

Abstract

The emergence of sociosemiotics in the second half of the 20th century was of a controversial nature. It came along in the process of specialisation in the social and humanitarian sciences, accompanied by the discovery of new research areas and objects, oftentimes of *ad hoc* essence. Due to relatively specific studies, the paradigm of sociosemiotics did not appear in clear theoretical structure, nor was it featured by fine boundaries. It was characteristic that understanding this vague area was even echoed in terminology – sometimes this new land was and is being called social semiotics, sometimes sociosemiotics. Yet there are some decisive and essential arguments for preferring the latter.

On the other hand, search for the roots of sociosemiotics takes us back to the end of the 19th and the beginning of the 20th century. There we can find movements in the study of man, culture and society that were driven by aspiration for a holistic paradigm. The pragmaticist context of the birth of modern semiotics set up a completely novel understanding how to study meaningful phenomena and was defined by the pragmatic dimension of semiotics. This understanding was shared by ground-breaking works that formed ground for the birth of several disciplines individual disciplines during later years. Yet the foundation of psychology, cultural anthropology, sociology, philology was the same essentially semiotic soil.

The introduction of sociosemiotics is an example of the logic of disciplinary evolution in the course of formation, separation, joining and re-formation of research areas characterised by terms as multi-, poly-, cross-, inter-, transdisciplinarity. In the context of sociosemiotics as a possibility to again join together the semiological and the semiotic trends, it seems important to understand the fundamental need to study man, culture, society and environment from a coher-

ent and holistic perspective. That, at the beginning of the 21st century, leads us back to certain fundamental scholarly principles the held a century ago.

1. Conversion or dispersion?

The emergence of sociosemiotics in the second half of the 20th century was of a controversial nature. It came along in the process of specialisation in the social and humanitarian sciences, accompanied by the discovery of new research areas and objects, oftentimes of *ad hoc* essence. Due to relatively specific studies, the paradigm of sociosemiotics did not appear in clear theoretical structure, nor was it featured by fine boundaries. It was characteristic that understanding this vague area was even echoed in terminology – sometimes this new land was and is being called social semiotics, sometimes sociosemiotics. Yet there are some decisive and essential arguments for preferring the latter. ‘Social semiotics’ has its historical roots in rather characteristic and circumstantial issues that pertain more to the level of the policy of scholarship than the latter itself. First, during decades following World War II, ‘social issues’ came to the front in at least two aspects. On the one hand, quests for handling societies and creating stabile and manageable social systems obtained a sharpened status. Another aspect was connected with these practical problems of handling social organisations – an overall inclination towards the so-called leftist ideologies (e.g. Marxism, ‘socialist’ tendencies that were switched into scholarship) as opposed to those that were associated with the social collapse of previous ‘world order’ that had led to the disastrous events of World War II.

‘Social semiotics’ seems to have appeared as a combination of these two major points. Here we can draw an illustrative example that is explanatory in several aspects. The study of subcultures – that oftentimes is associated with social semiotics – has been considered as a hijacking of the notion of culture, and turning it into a *device* for displacing the ‘social’ as a source of explanation (Jenks 2005: 133). Tremendous problems and consequences arise from here. Subcultures, taking up a logical trail, appear as life-styles or ways of life instead of referring to certain social groups that have to do with class division. For example, consider a thin pneumatic mucky Liverpool boy dressed in rugs playing with mates alike with him in a backyard of a grey apartment house. His situation might have been explained in social, societal and sociological terms: having been born into a specific primary group, he found himself in an inescapable vicious circle that pre-determined his further life-cycle. From the viewpoint of post-war culture studies (especially, for example the Birmingham Centre for Contemporary Cultural Studies) that introduced the notion of subcultures as it is mostly comprehended today, that boy was to be treated a member of a subculture who had chosen his way of life according to his free will. That, of course, was in a suitable coherence with the concurrent governmental policy and practical actions (or inactions) concerning social matters. Furthermore, ‘subcultures’ became into a cliché to designate ‘reparable young white male youth’ (Jenks 2005: 135).

We can see immense and tragic consequences that follow from this example and how this example characterises the emergence and several trends in ‘social semiotics, if we put the previous sentence into other words. Namely: subcultures lost their status as a ‘blank object’ of study, and became into a conventional symbol or a symbolic notion agreed by default to stand for a more-or-less specific societal congregation that was based on voluntary membership and followed a common way of life. It is self-evident that the totality of societal issues and practical problems were much more demanding to map than to just hide them behind the notion of ‘culture’. The latter became a ‘spin-off-term’ stolen from traditional fields concerned with the study of culture (cultural anthropology, cultural psychology, semiotics, theory of culture), and was thrown out there to stand guard in front of societal issues that were simply covered by it. Alike tendencies can be seen also in connection with semiotics, and unfortunately in connection with ‘social se-

miotics' as an area formed of case studies based on similar backbones of spun (not to say hijacked or stolen) terms of semiotics. On the one hand we can witness how specific semiotic or semiological terms have been ruthlessly taken out of the context of semiotics in order to bring charm to, for example of gender, media, fashion, and so on. This is not to say those would not appear as analysable in semiotic terms, but sporadic application of semiotic terms has not benefitted the relevant application nor made semiotics more comprehensible for a wider range of researchers and readers. As a most frequent example, we can even name the 'signifier' and the 'signified' – terms seeming easily graspable and elegantly applicable. However, it has been exactly drawing them out of the semiotic context that has taken them to purely material and materialistic level. The latter has nearly nothing to do with the original Saussurean paradigm and suchlike misinterpretation (the signifier as the word 'tree' and the signified as the real object we can chop for firewood) has no explanatory value in the studies and fields they have been deported to. Rather, one of the few side-effects has been the gradual misinterpretation of semiotics and semiology in general, and associating them with the very concrete structuralist methodology.

From another angle, 'social semiotics' as studying, for example advertising, mass media or gender, points to a different misleading way of building up pseudo-disciplines and misinterpreting the so-to-speak parent disciplines. These are often created on the basis of case studies. This, in turn means that they frequently lack of systematic research methodology and rely on the insight of a concrete scholar and are thus determined rather to the status of ideological exclamations than scholarship proper. (A good example here concerns again the issue of subcultures as related to core cultures.)

2. Major premises of sociosemiotics

On the other hand, search for the roots of sociosemiotics takes us back to the end of the 19th and the beginning of the 20th century. There we can find movements in the study of man, culture and society that were driven by aspiration for a holistic paradigm. The pragmaticist context of the birth of modern semiotics set up a completely novel understanding how to study meaningful phenomena and was defined by the pragmatic dimension of semiotics. This understanding was shared by ground-breaking works that formed ground for the birth of several disciplines individual disciplines during later years. Yet the foundation of psychology, cultural anthropology, sociology, philology was the same essentially semiotic soil.

The introduction of sociosemiotics is an example of the logic of disciplinary evolution in the course of formation, separation, joining and re-formation of research areas characterised by terms as multi-, poly-, cross-, inter-, transdisciplinarity. In the context of sociosemiotics as a possibility to again join together the semiological and the semiotic trends, it seems important to understand the fundamental need to study man, culture, society and environment from a coherent and holistic perspective. That, at the beginning of the 21st century, leads us back to certain fundamental scholarly principles the held a century ago and can be seen as major (not all premises of contemporary sociosemiotics as well:

Linguistics	Ethnoscience
<p>Premise 1: Language is a conceptual code underlying speech behaviour. Corollary: The primary goal of linguistic description is a grammar – a structural description of the linguistic code.</p>	<p>Premise 1: Culture is a conceptual code underlying social behaviour. Corollary: The primary goal of ethnographic description is a “cultural grammar” – a structural description of the cultural code.</p>
<p>Premise 2: Each language must be studied as a unique structural universe. Corollary A: A language must be described in terms of its own distinctive elements and principles of order (within the framework of the linguist's metalanguage and his theory of linguistic structure). Corollary B: Linguistic codes and the grammars that describe them are by their nature not amenable to structural comparison.</p>	<p>Premise 2: Each culture must be studied as a unique structural universe. Corollary A: A culture must be described in “emic” terms; that is, in terms of its own distinctive elements and principles of order. Corollary B: Cultural codes and cultural grammars are by their nature not amenable to structural comparison.</p>
<p>Premise 3: The structure of a language can be discovered by applying systematic and explicit procedures to a corpus of evidence. Corollary A: The evidence supporting a grammatical description is a potentially public, finite corpus of data to which an explicit set of analytical procedures has been applied. Corollary B: A grammar is thus testable (to see if it accounts for the data) and amenable to alternative analyses.</p>	<p>Premise 3: The structure of a cultural code can (or must) be discovered by applying systematic and explicit inductive procedures to a corpus of evidence. Corollary A: The evidence supporting an ethnographic description is a potentially public, finite corpus of data to which an explicit set of analytical procedures has been applied. Corollary B: An ethnography is thus testable (to see if it accounts for the data) and amenable to alternative analyses.</p>
<p>Premise 4: Since the linguistic code is mainly unconscious, the data for grammatical analysis must consist of speech behaviour, not informants' statements about the code.</p>	<p>Premise 4: Form 1: The primary data of ethnographic analysis consist of informants' statements about the code and records of their speech behaviour. Form 2: All available data, including behavioural records, the ethnographer's intuitions/and speech behaviour, provide evidence from which an underlying cultural code can be inferred, and against which descriptions can be tested.</p>

Table 1: R. Keesing's comparison of linguistics and ethnoscience (Keesing 1972: 301).

From this very open outline of the study of culture and social behaviour, at least two kinds of

observations follow. On the one hand, as said, the study of sociocultural systems must engage the pragmatic dimension. Here lies an advantage of cultural anthropology as compared with cultural semiotics that inclined, or at least is accused in inclination towards structuralism. The pragmatic dimension of social and cultural phenomena means that suchlike studies by their nature belong to social sciences proper: next to the researcher and the object of study, there must always be involved a third party in the face of the informant or the user of meaningful phenomena analysed. It does not mean that the informant must necessarily be embodied in a physical human shape – the party providing the researcher with the possibility of ‘reality check’ can also be formed by a textual body as a corpus of evidence. On the other hand, if we view cultures as semiotic systems, then they coincide with sociocultural systems that have been defined by R.M. Keesing as systems that “[...] represent the social realizations or enactments of ideational designs-for-living in particular environments” (Keesing 1974: 82). This exactly the standpoint of contemporary sociosemiotics: we cannot and must not approach isolated semiotic phenomena in their artificially isolated environments, but have to keep always in mind the complex ‘man-culture-society-environment’.

Perhaps at this point we should recall that alongside with the emergence of the society and the ‘Self’ as its unit, in parallel there came into being contemporary macrosemiotic research units called ‘cultural codes’ by Keesing that seem by now halted at the notion of the semiosphere. Interestingly, Keesing’s ideas about the study of culture coincide not only with the pragmaticist ideas of dimensions of semiotic study, but also with the Saussurean semiological principles that led Saussure to the formulation of semiology as a part of social or general psychology. Talking about the centripetal forces that have led to contemporary sociosemiotics, we should probably remind that alongside with the pragmaticist and the semiological manifests, at approximately the same time, there emerged similar proposals by Vilfredo Pareto (1935) who designed much of contemporary societal studies under the title of sociology or general sociology with very similar principles as Saussure’s semiology and Peirce’s logic or semiotics. The same tendencies could be detected in cultural psychology and anthropology. These views share understanding of human environments as (semiotically) constructed or at least as mediated by signs and available through signs. Simultaneously have these views taken us to conceptions of the research object of social sciences and humanities as a whole. In different studies there have been applied various expressions for signifying the holistic network of suchlike research objects that condition each other and are mutually connected. Yet their contents and methodological logic for the analysis of man, culture, society and environment is alike, if not practically the same. We can recall, for example, of the following: ‘social world’ (Schutz 1967), ‘social system’ (Parsons 1952), ‘culture’ (Kluckhohn 1961), ‘*Lebenswelt*’ (Garfinkel 1967), ‘mundane reason’ (Pollner 1987), ‘semiotic reality’ (Merrell 1992), or even ‘semiotic Self’ (Wiley 1994) or ‘signifying order’ (Danesi 1998).

While oftentimes, and surprisingly in the context of semiotics itself, these notions lack concrete instructions for concrete communities, Keesing represents culturo-anthropological view offering quite clear understanding and suggests, as numerous other scholars of culture and society, that at the study of meaning-based communities, we must concentrate at issues pertaining both to perception, cognition and articulation. Alike research programs have been put forth by several authors and disciplines, beginning from grounds for contemporary sociocultural analysis as represented in the hypothesis of linguistic relativity or in principles of ethnomethodology; in semiotics perhaps most straight-forwardly in the seven major strategic points of the signifying order (Danesi and Perron 1999). These points also fit together with another major source for the formation and formulation of sociosemiotics: the systems theory which reached, in the semiotic context, its high tide in the face of J.Ruesch’s *Semiotic Approaches to Human Relations* – probably the most holistic and monolithic contribution not only to semiotics and psychology,

but for all social sciences and humanities published already in the 1970s (Ruesch 1972).

Whereas social semiotics in its centrifugal influences could be associated with the analysis of quite concrete types of objects (gender, media, etc.), then the actual holistic nature of the study of culture and society shows that in the course of socialisation, all societal structures become functional on the metalevel. Ideological tendencies that cast light at specific developments or phenomena in culture and society (feminism, the emergence of 'new species' as transvestites, accentuating or underemphasizing differences between races, social groups, gender roles) may, and in fact have, led to insularised and isolated areas of research. The sociosemiotic understanding of the analysis of culture and society calls for – and reminds of – the need for holistic and complex study perspective that would aim at transdisciplinarity.

Cooperation between people forming a society can be described through institutions mediating their interaction, and by the more-or-less commonly consented goals of teamwork. The aims of societal interaction influence the structure of institutions and their mutual relationships. It is important that besides treating societal organisations as institutions, we should have an alike attitude towards sociocultural sign systems. Suchlike a view would probably also help to understand how social situations conjoin social groups diachronically too, and to see how the semiotisation of the world is arranged via diverse communities of competence (linguistic, communicative, cultural, semiotic competence). From these considerations we comprehend the centripetal forces that are at work at the formation of a transdisciplinary paradigm centred at sociosemiotics as aiming to study sociocultural systems as complexes formed of man, culture, society and environment.

REVELIO! A (SOCIO-)SEMIOTIC READING OF THE HARRY POTTER SAGA

Gloria Withalm
University of Applied Arts Vienna, Austria
gloria.withalm@uni-ak.ac.at

Abstract

Though it's already seventeen years that Harry Potter and the Philosopher's Stone appeared, the first novel of the Harry Potter saga concluded by Harry Potter and the Deathly Hallows in 2007, the craze about the Boy Wizard has a bit decreased but is by far not over: in 2012 the Leavesden Studio near London (where all eight movies were made) opened as the Warner Bros. Studio Tour London and J.K. Rowling started her interactive website Pottermore; since 2010 fans can visit Hogsmeade and Hogwarts School of Witchcraft and Wizardry at the Orlando, FL theme park Wizarding World of Harry Potter which has just got a second part depicting Diagon Alley; and in 2016 the first part of a new trilogy dealing with the author of *Fantastic Beasts and Where to Find Them* will hit the movie theaters all over the world.

It is already seventeen years that *Harry Potter and the Philosopher's Stone* (Rowling 1997) appeared: the first novel of the Harry Potter saga concluded with *Harry Potter and the Deathly Hallows* in 2007.¹ The craze about the Boy Wizard has decreased slightly, but is by far from over. Books appear in new editions; all the films are constantly aired on television; ever new DVD and Blu-ray boxes appear on the market; and there are various activities connected to Harry Potter (from conferences to websites) – enough to keep older fans on track and attract ever new fan generations.

¹ A brief summary of the saga: Surrey, England in the early 1990s. An eleven-year-old orphaned boy, raised by his maternal aunt and her husband, is told that he is a wizard and will receive his education at Hogwarts School of Witchcraft and Wizardry, somewhere up north in Scotland. Already in his first year he is confronted by Voldemort, the wizard who has murdered Harry's parents, but failed to kill the little boy. Over the next years the boy and his friends, in particular Ron and Hermione, continue to fight the Dark Lord, until, at the end of the seventh and last book, Harry is finally victorious and during a duel Voldemort dies of his own Killing Curse.

Reading the books, watching the movies and buying collectibles is definitely not confined to young adults, the original primary target group, nor is all that done just for fun, as the long list of books and articles analyzing the texts and the phenomenon demonstrates. Authors – and even a few scientists are among them – come from the entire spectrum of the humanities. However, there are so far not too many semiotically oriented papers.

In this essay, I will attempt to read the texts from three different canons (the novels, subsequent writings by J.K. Rowling in print and online, and the movies), from a socio-semiotic perspective inspired by the work of Ferruccio Rossi-Landi. I will focus on the character of magical performance which can be examined in view of his concepts of materiality, signs and bodies. Unfortunately, other questions touching a more comprehensive (socio-)semiotic analysis can only be briefly mentioned; the same goes for topics obviously related to specific sign systems like runes and divination as well as the strong intertextual and intratextual relations presented in the saga.

1. From one *Philosopher's Stone* to three *Deathly Hallows*: a brief introduction to the Harry Potter universe, the “Potterverse”

There are the seven books (*Harry Potter and the Philosopher's Stone*, ...*Chamber of Secrets*, ...*Prisoner of Azkaban*, ...*Goblet of Fire*, ...*Order of the Phoenix*, ...*Half-Blood Prince*, ...*Deathly Hallows*; Rowling 2004a–e, 2006, 2008a) published in ever new editions both in the UK and in the US, not to mention the translations appearing in more than 70 languages plus the three smaller books (*Quidditch Through the Ages*, *Fantastic Beasts and Where to Find Them* and *The Tales of Beedle the Bard*; Rowling 2001a, 2001b, 2008c) and a sort of prequel of approximately 800 words (Rowling 2008b). There are eight movies (Columbus 2001, 2002, Cuarón 2004, Newell 2005, Yates 2007, 2009, 2010, 2011); and rumor has it that in 2016 the first installment of a new trilogy will be released focusing on the *Fantastic Beasts and Where to Find Them* and its “author” Newt Scamander. In 2012 Rowling launched the *Pottermore* website with a chapter by chapter presentation of the books and tons of additional background texts (as of December 2014, the last three chapters of book five plus books six and seven are not yet online).

Since 2010 fans can visit (a reconstruction of the film architecture of) Hogsmeade and the Hogwarts School of Witchcraft and Wizardry at the Florida theme park The Wizarding World of Harry Potter. It has recently opened a Diagon Alley part (Diagon Alley is a famous street in the Harry Potter stories). In July 2014 another theme park opened as part of the Universal Studios Japan in Osaka; a third one in Los Angeles is under construction. The Leavesden Studios near London (where all eight movies were made) opened their sets in 2012 for the Warner Bros. Studio Tour London, and since 2009 a Harry Potter exhibition is touring the world. Last but not least, there is the massive merchandising, both in shops and online, offering e.g. replicas of wands, scarfs in the colors of the four houses, bookmarks, etc. Since December 2012 even in King's Cross Station there is a Platform 9¾, the train platform where Harry and his cohorts leave from for Hogwarts.

2. A first closer look on the saga from a semiotic view point

There aren't too many semiotic papers in the strictest sense on the series², but a lot has been written in closely related or overlapping areas. First and foremost, there are a number of analyses on the narrative structure. John Granger, perhaps the most important Harry Potter pundit, has published a discussion of the ring composition in each individual book and with regard to the

² In the 2011 Annual Meeting of the Semiotic Society of America, a panel dealt with the topic “Factual Fiction: A Structural Analysis of *Harry Potter*”. The four papers presented appeared also in the proceedings: Ellis 2012, Estep 2012, St. Dennis 2012, Williamson 2012.

whole series (2010).

Another aspect of the books that has been widely discussed is the overall intertextuality, both in the narrower sense of alluding to other literary texts, and in the broader sense of references to history, culture, and, above all, mythology. J.K. Rowling revived the genre of the English boarding school novel – to name just the most prominent example: *Tom Brown's School Days* (Hughes 1857; cf. Granger 2009 ch.3) – and fused it with other genres. On the level of particular writers, scholars have found parallels to both C.S. Lewis and J.R.R. Tolkien. When it comes to cultural and historical references, we may look at actual persons, like Nicolas Flamel, the French medieval alchemist, whom Rowling remodeled to be part of her universe. And there are all the mythical creatures, from basilisks or centaurs to unicorns and werewolves.

Moreover, we find also intratextual relations, like the two stones that figure prominently in the series: the Philosopher's Stone in the first novel, used to create an Elixir of Life (which “will make the drinker immortal”, Rowling 2004a: 149), and the Resurrection Stone introduced in the final book (Rowling 2008a), which can bring back a shadowy version of dead persons. There are many more examples that can easily be recognized. One of them may even count as part of the above mentioned chiasmic structure. When Harry, Ron and Hermione try to secure the *Philosopher's Stone* towards the end of the first book, they are suddenly entangled by a magic plant that almost chokes them:

‘Devil's Snare, Devil's Snare ... What did Professor Sprout say? It likes the dark and the damp –’
 ‘So light a fire!’ Harry choked.
 ‘Yes – of course – but there's no wood!’ Hermione cried, wringing her hands.
 ‘HAVE YOU GONE MAD?’ Ron bellowed. ‘ARE YOU A WITCH OR NOT?’
 ‘Oh, right!’ said Hermione, and she whipped out her wand, waved it, muttered something and sent a jet of the same bluebell flames she had used on Snape at the plant [...]
 ‘Yeah,’ said Ron, [...] – “there's no wood”, *honestly*.’
 (Rowling 2004a: 299)

Close to the end of the *Deathly Hallows* book, the trio is again harassed by a plant, this time the Whomping Willow that guards the secret entrance to the Shrieking Shack: one has to push a knot on the trunk to immobilize it, as Hermione's cat Crookshanks did in the *Prisoner of Azkaban* (Rowlings 2004c: 362). This time Ron doesn't know what to do:

Panting and gasping Harry slowed down, [...] peering through the darkness towards its thick trunk, trying to see the single knot in the bark of the old tree that would paralyse it. Ron and Hermione caught up, Hermione so out of breath she could not speak.
 ‘How – how're we going to get in?’ panted Ron. ‘I can – see the place – if we just had – Crookshanks again –’
 ‘Crookshanks?’ wheezed Hermione, bent double, clutching her chest. ‘*Are you a wizard, or what?*’
 ‘Oh – right – yeah –’
 Ron looked around, then directed his wand at a twig on the ground and said, ‘*Wingardium Leviosa!*’ The twig flew up from the ground, [...]. It jabbed at a place near the roots and at once, the writhing tree became still.
 (Rowling 2008a: 713–714)

Socio-semiotic aspects of the saga focus, of course, on the societal make-up of the wizarding world and the political situation there. In this context, a lot has been said on the stratification of the society, including the position of non-human magical beings like the house-elves, or on the increasing rigor ending in the final installment in a fascist system.

Another topic would be the organization of the school community and the rituals that structure the year at Hogwarts. One of them is the start-of-term banquet with delicious food, preceded by allocating the first-year students to one of the four houses (Gryffindor, Hufflepuff, Ravenclaw, and Slytherin). However, contrary to an ordinary school, in Hogwarts this task is carried out by the Sorting Hat who reads the mind and personality of the child with regard to the characteristics related to the four houses. Among the other festivities in Hogwarts (and in wizarding families in general) we find Halloween, and Christmas at Hogwarts is celebrated with those students that stay in the castle over the holidays. In both cases, all well known elements and decorations are present, except maybe that the wizard crackers, i.e. the magic version of Christmas crackers, sometimes contain “a rear-admiral’s hat and several live, white mice” (Rowling 2004a: 220).

The skill of mind reading is not confined to the Sorting Hat: among wizards the respective technique is called *Legilimancy*. However, there are still more decoding processes present in the series. At least three practices described in the novels are akin to *interpretive reading*: one is divination in its various forms, from stargazing, as done by the centaurs, to the methods Professor Trelawney is teaching: palmistry; and seeing the future in tea leaves or by looking into a crystal ball. Hermione, who considers divination to be “very woolly” (Rowling 2004c: 122), likes other courses better: *Arithmancy*, a form of divination based on numbers, and translating texts written in ancient runes.

3. Magical (sign) processes

“*Revelio*” – the first word in the title of this essay refers to a spell, one of the major magic processes we encounter in the written and filmic texts. Casting spells is a typical topos in stories about witchcraft. However, spells in the Harry Potter saga have specific features that can be discussed in terms of the semiotic theory developed by the Italian semiotician and philosopher Ferruccio Rossi-Landi. The way Rowling meticulously describes the procedures and the effects presupposes that magic processes in general and spells in particular have always had both semiotic and material qualities simultaneously.

In the middle of the first chapter of the *Philosopher’s Stone* (“The Boy Who Lived”), we are confronted for the first time with magic when Dumbledore arrives at Privet Drive in Little Whinging, Surrey. Already since early morning a strange cat is sitting on a wall:

For some reason, the sight of the cat seemed to amuse him [Dumbledore]. He chuckled and muttered, ‘I should have known.’

He had found what he was looking for in his inside pocket. It seemed to be a silver cigarette lighter. He flicked it open, held it up in the air and clicked it. The nearest street lamp went out with a little pop. He clicked it again – the next lamp flickered into darkness. (Rowling 2004a: 15)

In the film version of the scene, the lights are actually whooshing from the lamps into the device. But there is even more in this scene, though we are allowed a closer look at the very process only later on. Dumbledore

set off down the street towards number four, where he sat down on the wall next to the cat. He didn't look at it, but after a moment he spoke to it.

'Fancy seeing you here, Professor McGonagall.'

He turned to smile at the tabby, but it had gone. Instead he was smiling at a rather severe-looking woman who was wearing square glasses exactly the shape of the markings the cat had had around its eyes. (Rowling 2004a: 16)

Explanation: Minerva McGonagall is an *Animagus*: she can change into an animal at will. In the movie *Harry Potter and the Philosopher's Stone* (Columbus 2001), we can watch how she does it. When Ron and Harry are late for their very first Transfiguration class, the desk is empty except for a cat. Satisfied that they escaped a reprimand, Ron panted, "Whew! We made it! Can you imagine the look on McGonagall's face if we were late?" A split second later he realized how wrong he was: with an elegant leap the cat turned instantly into Professor McGonagall.³

4. Rossi-Landi on "Signs and Bodies"

These last two examples showed two different magic processes which both involved very material effects. Let us now consult Rossi-Landi's semiotic theories. Forty years ago, Ferruccio Rossi-Landi wrote a paper titled "Signs and Bodies", which he presented at the first Congress of the International Association for Semiotic Studies in Milan in June 1974. Later on the text appeared in the proceedings, edited by Chatman, Eco and Klinkenberg (Rossi-Landi 1979; 1992b).

In this relatively short text he proceeds from five propositions concerning the relation between signs and bodies, and since the paper is not widely known, I will present some central quotes:

A, All signs are bodies;

B, Not all bodies are signs;

C, All bodies can be signs.

And

D, Signs are not bodies;

E, All bodies are signs. (Rossi-Landi 1992b: 271)

Rossi-Landi formulates his main working hypothesis as such: whereas D and E belong to idealistic semiotics, the propositions A to C form "the basic model of materialistic semiotics" (Rossi-Landi 1992b: 272). He continues by further discussing the intricate relation:

According to this hypothesis, materialistic semiotics starts with bodies, and by realizing that bodies can be *or not be* signs, comes to consider signs as a subclass of bodies-in-general (Rossi-Landi 1992b: 272).

Rossi-Landi also makes a remark here that is of importance for our understanding of particular sign and material operations:

³ In the novel, McGonagall demonstrates transfiguration by changing "her desk into a pig and back again." (Rowling 2004a: 147)

As speakers of at least one natural language, we all distinguish between “signs” and “bodies” to some extent. [...] All we need to add at this stage is that ‘bodies’ in the widest sense must refer to *all conditions of matter, including energy*, and that ‘signs’ stands for semiosis in general. (Rossi-Landi 1992b: 272; my emphasis)

Later in the text Rossi-Landi argues against “Semiotical Panlogism”:

Bodies, and not signs only, are the world’s furniture. Bodies are to be met both outside of signs and within signs themselves. Interpreters are bodies with needs, desires, illnesses, etc., and not only bodies capable of using signs. [...] If you kill a man, you kill a man, and not only an interpreter. Social life, while being entirely covered by sign systems up to the point that without signs it wouldn’t be social and, possibly, it wouldn’t even be life, consists also of something else. (Rossi-Landi 1992b: 275)

Rossi-Landi concludes by asking for several lines of investigation that he actually carried out himself over the next decade, starting with his “Theory of Sign Residues” in which he further elaborates the specific materiality involved in semiosis.⁴ Without conducting an in-depth discussion of his semiotic models, I’d nevertheless like to mention at least one aspect that is related to the matter–sign relation. The most comprehensive concept in Rossi-Landian socio-semiotics is *Social Reproduction* – “the sum total of all processes by means of which a community or society survives, grows bigger, or, at least, continues to exist.” (Rossi-Landi 1985: 175)

Viewed in their totality, there are several different processes that act within social reproduction. The basic one, summarized in the *Schema of Social Reproduction* (Rossi-Landi 1975: 65; 1985: 38), is the cycle of *production – exchange – consumption*, composed of “three indissolubly correlated moments” which social reproduction “always comprehends in a constitutive way” (Rossi-Landi 1975: 65). The moment of exchange, conceived in a twofold way, is at the very center of the schema. It is *simultaneously* both external material exchange, and sign exchange, which is in itself the reduplication of the entire cycle and comprehends again “three indissolubly correlated moments”: sign production, sign exchange and sign consumption.

1. External material **production** which, although *it uses signs*, produces not signs but bodies.

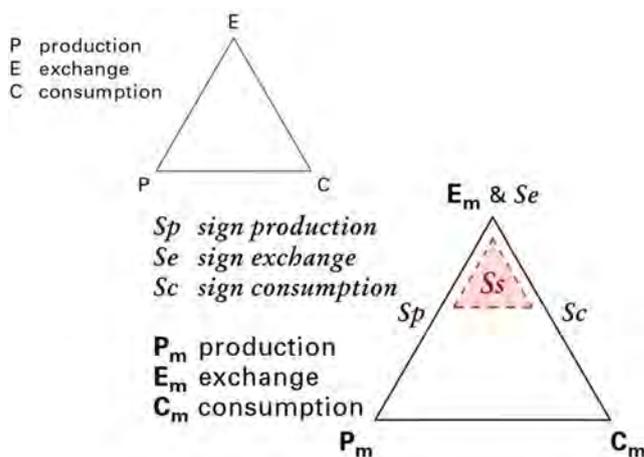

2. EXCHANGE, which is always, at the same time and constitutively,

{	external material EXCHANGE, that is, the process of exchanging not signs but bodies;						
{	sign EXCHANGE, that is, communication, including as such within it: <table style="border: none; margin-left: 20px;"> <tr> <td style="font-size: 3em; vertical-align: middle;">{</td> <td style="padding-left: 10px;">sign production,</td> </tr> <tr> <td style="font-size: 3em; vertical-align: middle;">}</td> <td style="padding-left: 10px;">sign EXCHANGE in the strict sense, and</td> </tr> <tr> <td style="font-size: 3em; vertical-align: middle;">}</td> <td style="padding-left: 10px;">sign consumption.</td> </tr> </table>	{	sign production ,	}	sign EXCHANGE in the strict sense, and	}	sign consumption.
{	sign production ,						
}	sign EXCHANGE in the strict sense, and						
}	sign consumption.						

3. External material **consumption**, which, even when *it uses signs*, consumes not signs but bodies.

⁴ In his last lecture in Bari in April 1985, Rossi-Landi came back once more to the topic of signs and their residues (Rossi-Landi 1988).

When switching from the verbalized schema (which already includes a spatial presentation of the internal relations) to a diagrammatic form, the most adequate configuration seems to be the triad. Proceeding from the basic triad P–E–C, the two different moments of exchange can be visualized by reduplicating the triad of sign production, sign exchange and sign consumption within the major point of exchange.

5. The semiotics of spells and other magic practices

Analyzing magical processes as described and depicted in the Harry Potter saga in the light of these concepts reveals them to be excellent examples of the sign-body duality. Magical sign processes are *always simultaneously and in a constitutive way* material and sign processes. The semiotic elements and the material elements are indissolubly correlated.

Sign production in the process of magic is always and at the same time the production of something material in the strict sense, hence the semiotics of Rossi-Landi is the appropriate background theory. Magical processes are part and parcel of the Potterverse. Though, according to Rowling, the ability to do magic is innate; it is not confined to wizard/witch families and can occur also in “Muggle-born” children (i.e. of non-magical parents).

Since spells are definitely the central magic procedures, my examples come from this domain. In general, a spell consists of an *incantation* (vocalized or non-verbal, that is, only mentally represented) mostly together with a specific *movement* of the *wand*; the *intent* to cast the spell;⁵ and the *effect/result*. (Maybe it’s too far-fetched, but this triadic structure of spells seems to be akin to certain models of signs or semioses.) Based on the books, we find several classifications of spells, like transfiguration, charm, jinx, hex or curse (cf. <http://harrypotter.wikia.com/wiki/Spell>). For our purpose I propose another simplified way of arranging spells, or acts of magic in general, into two major categories, differentiating between:

- (i) the materiality of the magic process; and
- (ii) the materiality of the result.

The first category comprises both the corporeal quality of the process itself, and whatever emanates from the wand when a spell is cast. The second category touches the actual changes of the target of the act of magic. Beginning with the second category, we have already witnessed, in Ron Weasley’s words (Columbus 2001) one “bloody brilliant” act of magic, the auto-transfiguration of an Animagus. Transfiguration is one of the major subjects taught at Hogwarts, at

⁵ After Bellatrix has killed his godfather Sirius Black in the *Order of the Phoenix*, Harry tries to cast a *Cruciatus* curse on Bellatrix that fails to produce the proper effect. She claims to know why: “You need to *mean* them, Potter! You need to really want to cause pain – to enjoy it” (Rowling 2004e: 891).

one point in the *Chamber of Secrets* movie we are allowed a closer look at the spell and wand movement involved when Professor McGonagall demonstrates how an animal is turned into a water goblet (Columbus 2002).⁶

Even if they are not capable of changing into an animal, wizards and witches can disguise themselves as objects, as is the case with Horace Slughorn early in the *Half-Blood Prince* where he appears to be an armchair. Yet he can't fool Dumbledore:

And without warning, Dumbledore swooped, plunging the tip of his wand into the seat of the overstuffed armchair, which yelled, 'Ouch!' 'Good evening, Horace,' said Dumbledore, straightening up again. Harry's jaw dropped. Where a split second before there had been an armchair, there now crouched an enormously fat, bald old man who was massaging his lower belly and squinting up at Dumbledore with an aggrieved and watery eye. 'There was no need to stick the wand in that hard,' he said gruffly, clambering to his feet. 'It hurt.' (Rowling 2006: 81)

In the wizarding world even memories appear in material form as silvery-white gossamer-like threads. Just like files from a hard disk, they can be extracted from the brain, stored away in vials, and later on, be poured into the Pensieve and revisited:

Then, very slowly, Slughorn put his hand in his pocket and pulled out his wand. He put his other hand inside his cloak and took out a small, empty bottle. Still looking into Harry's eyes, Slughorn touched the tip of his wand to his temple and withdrew it, so that a long, silver thread of memory came away too, clinging to the wand-tip. Longer and longer the memory stretched until it broke and swung, silvery bright, from the wand. Slughorn lowered it into the bottle where it coiled, then spread, swirling like gas. He corked the bottle with a trembling hand and then passed it across the table to Harry. (Rowling 2006: 580)

Now to the first category. The books are full of vivid descriptions of the corporeal aspect of spells. You "aim" and "shoot" a spell at somebody; if you do not "dodge" or "leap aside" to avoid the spell, it will "hit" you – and you will experience or even suffer the result: from a mere tickle (*Rictusempra*) to confusion (*Confundo*); losing the own wand (*Expelliarmus*); being unable to move (*Impedimenta* or *Petrificus Totalus*); being stunned and unconscious (*Stupefy*); feeling unbearable pain (the *Cruciatus* curse); or in the worst case: dying (*Avada Kedavra*).

The spell can also result in more or less massive (temporary or permanent) visible and tangible changes of the body or the targeted object: objects can be raised into the air (*Wingardium Leviosa*); caused to explode in flames (*Confringo*); made bigger (*Engorgio*) or smaller (*Reductio*); or made to vanish completely (*Evanescio*). Among the spells causing body alterations we find: *Furnunculus* (to produce boils and pimples); *Episkey* (to heal minor injuries like a broken toe or nose); a vomiting slugs hex; a stinging hex which swells the face beyond recognition; and the *Sectumsempra* curse that slashes a person, resulting in deep, mostly incurable wounds (only

⁶ In the book, the children have to turn a beetle into a button. (Rowling 2004b: 105)

Snape knows an incantation to heal them; cf. Rowling 2006: 618). However, since the casted spell itself has a corporeal quality, you can “block”, “repel” or “deflect” a spell. It can “rebound” on a wall and “bounce back” or hit an object and smash it.

The tip is the most important part of the wand, as many different objects can emerge from or shoot out of it: *Lumos* lights the tip of the wand; *Aguamenti* produces a jet of water (Rowling 2004d: 394; 2006: 714); when two persons make an *Unbreakable Vow*, a “thin tongue of brilliant flame” shoots from the wand of the person casting the spell, “making a fine, glowing chain” around the hands of those engaged in the vow (Rowling 2006: 49). The wand can also be used for decoration purposes: “Hermione made purple and gold streamers erupt from the end of her wand and drape themselves artistically over the trees and bushes” (Rowling 2008a: 133); when the incantation *Orchideous* is spoken, a “bunch of flowers burst from the wand tip” (Rowling 2004d: 338); and both in the last book and in the movie, Hermione conjures a wreath of Christmas roses when they visit the grave of Harry’s parents (Rowling 2008a: 365).⁷ The tip of the wand can be used in a less amiable way, as with the *Incarcerous* spell: ropes fly out of the wand and tie up the targeted person (e.g. Rowling 2004e: 826; 2008a: 187).

In one particular case, something extremely powerful erupts from the tip: the Patronus of the witch or wizard who casts the spell. Everyone has his or her own unique Patronus, a silvery shining guardian-being who shields a person against Dementors. Harry learns how to produce a Patronus in his private lessons with Remus Lupin in the *Prisoner of Azkaban*, and later on he teaches his friends in the *Order of the Phoenix*. The most common effect, however, is a flash or jet of light shooting from the wand. When in the first book, Harry finally finds his own, personal wand, “a stream of red and gold sparks shot from the end like a firework” (Rowling 2004a: 96). The light jets come in different colors for different spells: silver (*Rictusempra*), red (*Expelliarmus* or *Stupefy*), or, when the Killing Curse is performed, green.

Having a corporeal quality themselves, spells can collide in mid-air, which happens several times throughout the series. The most spectacular collision of light jets, however, appears in the final battle between Voldemort and Harry when they both cast their respective spells:

‘*Avada Kedavra!*’

‘*Expelliarmus!*’

The bang was like a cannon-blast and the golden flames that erupted between them, at the dead centre of the circle they had been treading, marked the point where the spells collided. Harry saw Voldemort’s green jet meet his own spell, saw the Elder Wand fly high [...]. And Harry, with the unerring skill of the Seeker, caught the wand in his free hand as Voldemort fell backwards, arms splayed, the slit pupils of the scarlet eyes rolling upwards. Tom Riddle hit the floor with a mundane finality, his body feeble and shrunken, the white hands empty, the snake-like face vacant and unknowing. Voldemort was dead, killed by his own rebounding curse, and Harry stood with two wands in his hand, staring down at his enemy’s shell. (Rowling 2008a: 814–815)

6. Semio-magic epilogue

Those who know Rossi-Landian semiotics may consider it odd to refer to a materialist sign theory to talk about a children’s book dealing with the wizarding world. However, for the pur-

⁷ However, when it comes to conjuring, the items a witch or a wizard can produce are somehow limited by *Gamp’s Law of Elemental Transfiguration* which contains five *Principal Exceptions*, such as food (Rowling 2008a: 325) and, as is evident by the existence of the vaults at Gringott’s (the bank in the wizarding world), money.

pose of recalling Rossi-Landi's discussion of the interrelation between signs and bodies, I hope that choosing such well-known and loved literature to analyze has helped to raise awareness of a topic vital to semiotics. The material aspects of sign processes are often neglected, but have to be taken into account, in order to avoid the idealistic trap. Why not do so with the help of literary examples? After all – to end with one of the last sentences spoken by the great wizard Dumbledore in the film *Harry Potter and Deathly Hallows Part 2* (Yates 2011) – “Words are, in my not so humble opinion, our most inexhaustible source of magic.”

SOCIAL CONSTRUCTION AND IDEOLOGY IN ANIMATION FILMS

Maria Katsaridou
Aristotle University of Thessaloniki, Greece
mkatsaridou@gmail.com

Abstract

This paper is part of a research on social semiotics and ideology in animation films, which is grounded on the theories of Saussure and Greimas and Courtés. Animation, apart from being a complex semiotic system per se, also hosts under the term “animation film” many different forms of animation, such as cel animation, stop motion animation, computer generated animation, and others. These forms are related to different methods of production, technology, techniques, geographic allotment of production and socio-economic conditions. The aim of this paper is to evince through examples from animation films that even though the meaning is produced within the semiotic system of the animation film, it is related and connected to production, material culture and thus society.

1. Introduction

This essay is part of a research in animation films which is grounded on the theories of Greimas and Saussure. There are many different forms of animation and they are related to different methods of production, technology, techniques, geographic allotment of production and socio-economic conditions. The research covers the period from 1995 to 2009 which is a period of continuous change in the animation industry and in film production methods in general. These changes are affecting the semiotic system of animation films. The aim of this essay is to show through examples from animation films that the production of meaning is linked to social conditions and material production methods since “The semiotic systems are produced by the exo-semiotic process of material production” (Lagopoulos 1986: 236) and thus, in order to study the production of meaning and ideology in animation films there is a need for connecting the semiotic system with its material production and society.

2. From animation production to the production of meaning

Whether cinema was invented in 1889 by Charles-Émile Reynaud and his Theatre Optique or in 1895 by the Lumière brothers, cinema from its early years was identified with live action films while animation films were associated with the visual effects of Georges Méliès. This dichotomy resulted in the devaluation of animation as a cinematic form and was grounded in the demand for “realism” and the misconception that live action films “depict reality” while animation films are “products of the imagination” and thus, “not real”. The false belief that the cinematic sign has a referent in the natural world led to the assumption that animation is not cinema but something “other”. In our days due to the rapid and continuous technological progress, the change in production methods and the massive use of animation and visual effects in live action film production that led to the consequent merging of the cinematic forms, we have realized more profoundly that all cinema is constructed, mediated and manipulated and so it is difficult to claim that any cinematic sign has a natural referent outside the semiotic system. The above is consistent with Saussure’s principle of arbitrariness in which is clearly stated that in every sign the connection between the signifier and the signified is arbitrary and the sign has no referent outside the semiotic system.

Many media and animation theorists like Lev Manovich (2001), Alan Cholodenko (1991, 2008), and Alexander Alexeief (1994) support the position that there is no difference between animation and live action films and that “film per se is a form of animation”. (Cholodenko 1991: 22–23, 2008: 10) or as Alexeief expresses it: “Anyhow, it is legitimate to consider cinema as a particular kind of animation, a sort of cheap, industrial substitute...” (Alexeief 1994: xix). While this is a very strong argument when we examine animation practice per se and we are addressing the question “what is animation?”, I argue that in the course of the history of cinema, animation and live action films have evolved into two different forms of cinema due to historical and social structures that led to the production of their distinctively different *langues*. According to Saussure, *langue* is a sign system in which the value of every sign is defined by its difference with the other signs of the system. It is a system of pure values “determined by nothing else apart from the temporary state of its constituent elements” (Saussure 1986: 80) and thus, it is not determined by any relations to objects. In his famous metaphor of language with a chessboard, he notes: “... a state of the board corresponds exactly to a state of the language. The value of the chess pieces depends on their position upon the chess board, just as in the language each term has its value through its contrast with all the other terms” (Saussure 1986: 88). For Saussure is central that all sciences should pay greater attention to the fact that their objects belong to two different axes, the axis of simultaneity (*axe des simultanités*), which refers to the relations between things that coexist and are independent of time, and the axis of successive (*axe des successivités*), which refers to the individual (as opposed to holistic) changes of all these things over time. These two axes define the first two of the four fields of linguistics that are following: (a) For Saussure the first and most important is the field of synchronic linguistics (*linguistique synchronique*), which studies the axis of simultaneity, that is the structure of language (the *langue*), as social system, and this at a static, simultaneous state. (b) The second is the diachronic linguistics (*linguistique diachronique*), which studies the axis of successiveness, that is successive forms of elements of *langue*. (c) The third is the linguistics of speech (of *parole*), namely the use of *langue*, and it is of secondary importance compared with the first type of linguistics. (d) The three previous linguistics is for Saussure “internal”, in so far as they are related to the language per se. He adds to these external linguistics (*linguistique externe*), which is a social linguistics, because is linking language with its outside socio-historical environment.

It is clear from the above that Saussure does not connect langue with the *exosemiotic*¹, which in our case is the material production of the animation films and that he relates langue and parole to two different branches of linguistics and he defines langue as the field of study of linguistics.

Many Marxists have criticized Saussure's separation of langue and parole: for example Mikhail Bakhtin (1981) criticizes Saussure's splitting of langue and parole as separating individuals and society where it matters most, at the point of their production. Eventually, theorists from the French semiotic tradition have shown that a semiotic analysis of parole is possible. Algirdas Julien Greimas (1966) developed thoroughly a narratological method of analysis that allows the analysis of *parole*. More recently, Alexandros Ph. Lagopoulos and Karin Boklund-Lagopoulou (1992) have provided us with a methodology that links the analysis of meaning with the social sciences and makes the *social semiotic* analysis of parole possible.

To return to animation theorists, Paul Wells (1998, 2007), Maureen Furnish (2008) and Giancarlo Bendazzi (2006) agree that animation has developed its own language in the course of its history. This language is continuously evolving and changing due to social changes and the constant technological developments that lead to consequent changes in production methods and labor. Animation is identified as such and differentiates itself as a cinematic form through its language that is connected to its material production methods. As the societies and the methods of production are changing, consequently the language of animation is constantly evolving and changing.

We cannot ignore the connection and interrelation between the semiotic, which is the language, and the exosemiotic, which is the material production, and thus, in order to study the production of meaning and ideology in animation films, we need to see it in connection with the material production and society. In order to achieve this, I have applied in the research an articulation of semiotics with Marxist theory, following Ferruccio Rossi-Landi (1990) and Lagopoulos (1980, 1986, 2000). This articulation with the exo-semiotic is grounded mainly on Lagopoulos's theory and more specifically in his *articulation of production*.

Lagopoulos defines three exo-semiotic articulations of a text: a) the *articulation of production or of derivation*, which is identified with Saussure's amorphous substance of ideas and consists of non-formalized ideology, that is, what Louis Hjelmslev calls the substance of the content; b) the *articulation of manifestation*, which consists of the substance of the expression, the manifestation of the semiotic system with the help of an exo-semiotic material (for Saussure it has a material nature and coincides with the phonic substance); and c) the *parallel articulation*, which is created by the reference of the semiotic system to external material referents (Lagopoulos 1986: 236–238).

The articulation of production bridges the semiotic with the material, socio-economic and technological, dynamics of society and through it the semiotic field is constituted. It follows that the epistemological and theoretical constitution of the semiotic field cannot be independent from the epistemological and theoretical formulation of material production, and that the main axes of the semiotic systems derive from material production. It further follows that for every structurally different type of society, which is founded for mainstream Marxism on the concept of mode of production, the semiotic fields in their historical specificity are differently structured. Thus, the a priori generalization of the structure of the semiotic field is misleading. It finally follows that, in the interior of a given society, to every structurally different social group (the fundamental social groups being founded for Marxism on the concept of 'class' in certain types of societies), corresponds a different variant of the general semiotic system of the society (see also Houdebine [1977: 164–165], who refers to Volochinov's views on language); thus, the general use of the concept of a general 'cultural text' is misleading. (Lagopoulos 1986: 236).

¹ The term *exosemiotic* in Lagopoulos (1986) defines "the outside of the semiotic system".

3. Analyzing animation films: case studies

Animation production is mainly geographically allocated in three areas: 1) Europe, where many different techniques have developed and the focus is on artistic expression and art films; 2) USA, where the industrialization of production and commercialization prevailed; and 3) since the 1980's we are witnessing the phenomenon of the impressive and continuous development of Japanese animation (anime), that is challenging American domination.

Usually when we refer to animation one of the first things that comes to mind is the productions of Disney. Since the early 1940s the dominance of Disney Company is undeniable and therefore we can say that it is both the dominant animation paradigm and that it expresses the dominant ideology. "It is safe to say that in no other medium has a single company's practices been able to dominate aesthetic norms to the extent that Disney's has". (Furnish 2008: 107). In other words, "Disney orthodox animation is the predominant language of animation". (Wells 2002: 4). The basic characteristics of Disney animation are: 1) industrial production 2) technological pioneering 3) films for children 4) films produced for universal consumption 5) strictly defined aesthetic code. The diachronic huge success of Disney led all other animation producers to be defined in relation to Disney animation, either by trying to imitate it or by standing in opposition to it. As Furnish writes: "In every type of cultural production, there are dominant forms of expression that tend to define it within the minds of people in the general public, if not specialists in the field. During the 20th century, the practice of 'animation' typically was identified by four characteristics: it was 1) American 2) created by cel artwork 3) made by men 4) made at the Disney studio". (Furnish 2008: 13)

The period under examination here covers the years between 1995 when Pixar released *Toy Story*, the first 3d computer generated feature film, and 2009. This is a period of constant changes in production methods and struggle for dominance in the field. During this period America is still dominant but its domination is challenged by the continuous rise and expansion of Japanese animation production. Disney and the American animation industry in general, following the demand for technological pioneering, has replaced cel² animation with computer animation and Disney, even though its dominance is not absolute, is still considered the leading company. The films that are used as examples below were produced during this period and their production technique is not only an aesthetic choice, but affects their deep structure. It is extremely interesting that these films are discussing and defending specific ideological choices concerning their production methods, labor and the social conditions leading to the choice of the way they are constructed.

3.1. Artistic creation versus industrialization of production: The Triplets of Belleville

Although it is difficult to refer to a European history of animation, as it is characterized by a great variety and diversity in the techniques and production methods that are applied not only from country to country but even within the same country, there is a common characteristic: if Disney/USA films have as their dominant characteristic industrialized production, Europe emphasizes art films, personal expression and aesthetic value. The relationship of European films with the arts remained unbroken and uninterrupted until the early 21st century. Even though many European films which have been produced by small groups and with almost no budget can be regarded as masterpieces, they did not succeed in reaching broad audiences. *The Triplets of Belleville* (Sylvain Chomet, 2003) apart from winning many prizes, enjoyed great commercial success and for this reason it is chosen here as a case study. Animation art films are usually short. This could be considered as a feature length art film. It is a hand drawn musical with very little dialogue and a film very rich in intertextual references.

² Cel animation is a type of hand drawn animation first applied by Disney.

The film narrates the story of an old woman and her orphaned grandson who wants to take part in the cycle race *Tour de France*. The Mafia kidnaps him together with other cyclists and takes him to Belleville in order to exploit his love of cycling to make money. His grandmother, madam Souza, succeeds in rescuing him with the help of three old singers.

Analyzing the film, the antithesis between art film productions versus industrialization/commercialization of entertainment is striking. All the codes merge to form the poles of this basic antithesis. The film is mostly concerned with the process of creating and the artist. If the bicycle race connotes the process of production, it is transferred from France to Belleville, a place that signifies the American way of life and industrial production. The Mafia, the production companies, are exploiting the artists. Due to industrialization the production process becomes not only mechanical but also mechanistic, leading artists from the pleasure of producing to the unhappiness of work done for profit. Competition and industrialization leads the artist to a race giving him no pleasure and in the end leaves him drained. The antithetical pair *unique* versus *identical* is another difference between art production and commercial production. While artists are poor, the industry is rich. Even though in the movie the grandmother finally rescues her grandson leading their adventure to a happy ending, the movie doesn't resolve in the same optimistic way the conflict between artistic and commercial production. The film concludes that the art films are old, with no production budget and they are defeated by the new, rich commercial production companies. The end phrase of the film is "yes, it's over", one of the few sentences used in the film, which leads to a sad conclusion for the European art films: The era of artistic expression is over.

3.2. The defense of identity: *Spirited away*

Hayao Miyazaki's Studio Ghibli is one of the best known Japanese anime studios in existence today and he is often referred to as the *Walt Disney of Japan*. Studio Ghibli has taken a different track from western companies when it comes to animation production. While Disney has chosen to base its production on technology and innovation, Studio Ghibli on the other hand is still producing films with the traditional Japanese anime, that is hand drawn, limited animation³ and has instead decided to use technology only as a background tool.

Spirited away (Miyazaki 2001) is the highest grossing film to date in Japanese cinema, as well as winning the 2003 Oscar for Best Animated Feature Film and a Golden Bear at the Berlin International Festival in 2002.

The film narrates the adventures of a teenage girl in the spirit world in order to save her parents, who have been transformed into pigs because of their gluttony.

The codes of the film are formed around the poles of the opposition between traditionality versus globalization. From the title itself, *kamikakushi* (hidden by kami/ deities), which alludes to Japanese folk belief, through many of the film's principal characters, such as Yubaba (a descendent of yamauba or mountain witch) and Kamaji (a *tsuchigumo* or earth spider) who are characters found throughout Japanese folklore, Japanese mythology and Shinto religion, to clothes and architecture like the traditional Japanese baths, all connote the intrinsic "Japaneseness" of the movie, supported by the choices of production methods and expressed by the specific technique that is used and the resulting aesthetic. "Westernness" on the other hand is the negative pole of the antithesis, connoting gluttony, consumerism and loss of identity. It is a movie in which Japanese animation is defending its identity.

3.3. Blame consumerism, not technological innovation: *WALL-E*

WALL-E (Pixar 2008) is an American 3d computer animation film (CGI) produced by Pixar Animation Studios. As mentioned above, Pixar is considered a technological pioneer. Its movie

³ In order to reduce production cost, in limited animation they don't draw the intermediate frame and design each time only the features that change.

Toy Story (1995) signified the entry into a new era for animation production as it was the first 3d animation feature film entirely constructed with the use of computers, which led to a radical change not only in the animation film industry but gradually also affected live-action film production, redefining the position of animation in the film production process as a whole. While redefining the position of animation in contemporary film production and projection, Pixar threatened the absolute sovereignty of Disney Company in the field and altered the prevailing stereotypes both in the aesthetic field and in movie content. The reaction of Disney came in 2006 when it bought Pixar. Despite the acquisition, Pixar was not incorporated into Disney but still retains its autonomy, both in the organization of its production line, which is based on a different model than the one Disney applies, and in the choice of the themes of its films.

WALL-E follows the tradition of Pixar's films in recording huge success: in addition to its numerous awards and high revenues it is considered by the public and many critics as one of the best movies of all times. For example, TIME Magazine ranked *WALL-E* first in its list of the "Best film of the decade" (Corliss 2009).

It is particularly interesting that while Pixar has led to the creation and dissemination of digital animation and is continually investing in new technology and software which in turn affect the organization of production and of human labor, the deep structure of the film focuses on the impact of technology on human labor and society.

The basic antithesis of the movie is expressed through the antithesis *humans* versus *robots*. Humans are categorized both under the code of nature, as biological organisms which are, and this of the consumer class, while the robots belong to technology under the culture code as well as in the productive/working class under the social code.

Therefore the antithesis between humans and robots is primarily an antithesis between nature and technology, namely nature and culture, and secondly between consumption and production. The consumerism of the humans leads both to the destruction of the natural environment and the destruction of their culture. It could therefore be argued that consumerism leads people to self-destructive behavior. The only thing that helps them to survive is a part of their culture: technology, robots. Robots ensure the survival of people, the remedy of the ecological disaster, the rescue of civilization and finally, the return of people to their natural environment.

The second antitheses that of consumption versus production, is associated with the social code. In the film a monopolistic company has the role of absolute monarch. As mentioned above, humans belong to the consumer / middle class and the whole production of this society is based on a new working class, a "technological proletariat" consisting of robots. The company- authority imposes its ideology and most people and robots follow it and reproduce it, massively and unquestioningly. Eventually the film defends technology. For the movie it is the upper-class ideology that leads humanity to destruction, not technology that is constructed to serve people. Full automation leads to a dystopian society but people can choose how they want to live. What is being criticized here is the consumerist-capitalist economic system. Summarizing, the film moves on two axes: first, exercising criticism towards the consumer society that leads to the destruction of the environment and culture, and second, defending technology as part of human culture. The movie proposes a change in the political-economic system, in which, however, a clear separation of classes is maintained, and a return to a more natural lifestyle and a more traditional production model without giving any clear suggestions about the proposed economic model and the role of technology in it.

4. Conclusion

The languages with which we conceive the world are social products and their production depends on social conditions and material culture. If semiotics ignores the social practices from

which the semiotic systems derive, we are inevitably heading to greater or lesser misconceptions. As I am following here the reasoning of Karin Boklund-Lagopoulou, it wouldn't be possible for me to express it in a better way, so I would like to conclude this essay with her own words:

We are constrained by the “languages” through which we conceive the world. If we do not have a theory of the production of these languages through the process of production and reproduction of human society, then the very possibility of scientific knowledge is lost (since science is itself a language), and we are simply all playing a game with signs. ... If there is no relation between semiotic systems and social practice – a practice that is not independent of semiotic systems, but that also has non-semiotic parameters – then the game is just in our mind. Which seems to me, personally, to be rather pointless.⁴ (Boklund – Lagopoulou 1983: 23)

NOT NATURAL: AN ARGUMENT FOR THE SOCIAL CONSTRUCTION OF CINEMATIC SEMIOSIS

Rea Walldén
Athens School of Fine Arts, Greece
rwallden@yahoo.com

Abstract

This paper argues for the constructed character of cinematic semiosis, without negating its specificity. It is framed in the wider epistemological discussion regarding the arbitrary or motivated status of semiosis in general, and of specific semiotic systems in particular. In this context, cinema has been one of the most contested cases, its expression-substance being both complex and heterogeneous, and including a component of moving, photographic image. This paper uses Hjelmslev's model of stratification of the sign-function (introduced in his 1954 essay "La stratification du langage") as a methodological grid, on which to demarcate the areas of discussion. Hjelmslev's model is a formalization of Saussure's epistemological rupture with regard to the definition of the sign, consisting in the radical de-essentialisation of semiosis which results from the fundamental semiotic arbitrariness. In this model, the traditional questions regarding the relation between the signifier and the signified are analyzed and re-situated into the conceptually distinct but interrelated issues of signification, reference and material support. Therefore, the question of the social constitution or relative naturalness of a semiotic system can be reformulated as concerning, on the one hand, the relation between its content-plane and expression-plane and, on the other, its relation to its exo-semiotic content-substance; while the specificity of extra-linguistic semiotic systems can be reformulated as concerning their expression-substance, and how this affects the previous question. The paper proceeds with a critical investigation of the main groups of arguments against the socially constructed status of cinematic semiosis, and attempts to refute them. These include arguments stemming from the concepts of iconicity, indexicality, and the literal indexicality of the photographic image, as well as arguments supporting a derivation of cinematic semiosis from the human cognitive faculties or even the physicality of the human body. The paper concludes with certain observations on the ideological character of the naturalization of the social and its political implications.

Introduction

Following Saussure's tradition of semiotics, the present essay argues for the constructed character of cinematic semiosis. It is framed in the wider epistemological discussion regarding the arbitrary or motivated status of semiosis in general. The essay begins with a summary of the main onto-epistemological premises composing the definition of the sign at the level of *langue*. Then, it situates the areas of contestation of the premise of social construction, when cinema is the semiotic system under consideration. It proceeds with a critical presentation of two large groups of arguments against cinematic semiosis' socially constructed status, and attempts to refute them. On the one hand, it investigates arguments founded on an assumed naturalness of the semiotic system's relation to referent reality; on the other, arguments founded on the shared human nature of the sign users. Finally, the essay examines the way such arguments become significant in the context of the larger debates over aesthetic realism and the biological foundation of the social and human sciences. It concludes with certain observations on the ideological character of the naturalization of the social and its political implications.

1. The onto-epistemology of semiotic systems in Saussure's tradition

In Saussure's tradition of semiotics, the ontological status of the semiotic unit is secondary to semiotic structure. In other words, ontologically, semiotic systems are not composed by signs; they are articulated into signs. Saussure's famous definition of the sign in *Cours de linguistique générale* (1916 [1972]) as "double-faced entity" (99) which links "a concept and an acoustic image" (98), is logically the last step of his definition of *langue*, i.e. of language as a system. Therefore, the present essay starts by reiterating the well-known definitional characteristics of *langue*, emphasizing their onto-epistemological aspects. The transition from *langue* to "semiotic system", i.e. the generalization from "linguistic" to "semiotic", is legitimized by Saussure's own prediction of the birth of a new science *sémiologie* [semiotics], of which "linguistics is but a part" (33). The present essay addresses precisely certain difficulties of this generalization, with the intention of arguing for its fundamental validity.

First and foremost, *langue* is a social construction. This means that *langue* is different from the sum of the natural abilities of its users – and consequently of the human species in general – which (abilities) make it possible. In Saussure's words, *langue* is "a social product of the faculty of *langage*" (25) and what is "natural to man is [...] the faculty of constructing a *langue*" (26). In other words, what is natural to the human species is the semiotic ability, which is clearly distinct from its products, i.e. the different *langues*. Furthermore, *langue* is different from its individual use, i.e. *parole* [speech], which it makes possible (30–31). This definition is clearly at odds with the presently dominant tendencies of Analytic Philosophy of Language, which dissolve the level of *langue* between universal logical structures, often ultimately connected to the biology of the human species, and linguistic use. One has to observe that by solely concentrating on the individual, either as carrier of the universal or as an actor in the communication act, what is avoided is a concept of society as structure. Saussure's definition opposes such a position, postulating clearly that *langues* are the products of social communities and, therefore dependent on socio-historical conditions.

Secondly, *langue* is described as an abstract and dynamical structure. The crux here is the conception of structure. The obvious clarification explains that *langue* is not limited to a semantics, it is not just a dictionary; it includes grammar, syntax, rules of production and use, relations and hierarchies. Then, it is equally important to stress the abstract character of this structure – both in the levels of the signified and the signifier; what Saussure formulates as "*psychique* [mental]" or existing "*dans le cerveau* [in the brain]" (32). However, *langue* is *abstract* as opposed to

being a *concrete* object; it is by no means an “abstraction”. It is different, and ontologically prior, to its possible actualizations in concrete institutions. Furthermore, although a structure, it is not a static one. As it is made clear, *langues* change through time by the action of *parole*. What has led to the common misunderstanding of *langue* as static is, on the one hand, its relative stability when compared to *parole*, and on the other, Saussure’s choice of a synchronic point of view. “Synchronicity” is a scientific point of view, not an ontological attribute.

Thirdly, *langue* is fundamentally arbitrary. While at first glance arbitrariness concerns the link between the signifier and the signified, it proves to have a much more radical meaning. In the first place, the “arbitrary” link is meant as conventionally, i.e. socially, constituted. Saussure’s intention is to oppose it to any idea of naturalness, not to imply that it is freely chosen by the user. In this sense, Saussure places his theory in the long historical debate over the naturalness or conventionality of language. Already in 4th c. B.C. in Plato’s *Cratylus*, Hermogenes, following Democritus, argues for a conventional link between names and things. However, intrinsic part of Saussure’s definition of the sign is the notion of differentiability, summarised by the famous dictum: “in *langue* there are only differences [...] without positive terms” (100) and expounded in connection with the concept of “linguistic value” (155-169). What *langue* does is to articulate the unperceivable and amorphous continua of sound and thought into double-faced formal units. Following Oswald Ducrot, I call this kind of arbitrariness “fundamental”, “to distinguish [it] from the arbitrariness of each isolated sign” (Ducrot & Todorov 1972: 30). Fundamental semiotic arbitrariness is Saussure’s epistemological rupture. It entails that semiotic communities articulate/shape the way they perceive the world through the process of giving it meaning. This move is analogous to Kant’s epistemological revolution; however, it transfers the locus of articulation from the cognitive capacities of the human species in general to the semiotic constructions of particular social groups. Similarly to its philosophical ancestor, it does not deny the independent existence of the world. What it does question is our ability to perceive, know and understand the world independently from our semiotizations.

As the individual sign is no longer constitutive and semiotic systems are not necessarily limited to “natural languages”, Louis Hjelmslev introduces the concept of “sign-function”, i.e. the structure of the constitutive relations of the semiotic phenomenon. In his 1954 essay “*La stratification du langage*”, he proposes its model.

Hjelmslev analyzed semiotic systems according to a double distinction: (a) between content and expression and (b) between form and substance. From this double division result four *strata*: content-form, content-substance, expression-form, expression-substance. Form selects substance and it is manifested by it. The substance-strata are ‘semiotically formed’. To speak of the *manifestante* without implying that it is so formed, Hjelmslev uses the term *matière*. Each substance-stratum consists of three levels: (1) the level of social, collective perceptions, which belongs to the stratification in the strict sense; and the (2) socio-biological and (3) physical levels, which don’t. Furthermore, as I have argued elsewhere (Walldén 2012a: 58–61), the intersection of the sign-function with the communication circuit causes a certain redoubling of the exo-semiotic substance, because of the differentiation between the sides of production and reception of the message. All the semiotic strata are intelligible constructs. Literal materiality belongs to the exo-semiotic realm. Signification is defined by the insoluble relation between content-form and expression-form, and not by reference to the exo-semiotic.

	CONTENT		EXPRESSION		
SEMIOTIC	(Sed) content-form		(Ser) expression-form		<i>sign-function articulations</i>
	content-substance 1		expression-substance 1		FORM
					SUBSTANCE
EXO-SEMIOTIC	<i>production</i> content-subst. 2	<i>reception</i> content-subst. 2	<i>reception</i> expression-subst. 2	<i>production</i> expression-subst. 2	Level 1 <i>social perceptions</i>
	<i>production</i> content-subst. 3	<i>reception</i> content-subst. 3	<i>reception</i> expression-subst. 3	<i>production</i> expression-subst. 3	Level 2 <i>socio-biological</i>
					Level 3 <i>physical</i>

Table: An extended model of Hjelmslev’s stratification.

In this model, which is a consistent formalization of Saussure’s definition of the sign, the traditional questions regarding the relation between the signifier and the signified are analyzed and re-situated into the conceptually distinct but interrelated issues of signification, reference and material support. Therefore, the question of the social constitution or relative naturalness of a semiotic system can be reformulated as concerning, on the one hand, the relation between its content-plane and expression-plane and, on the other, its relation to its exo-semiotic content-substance; while the specificity of non-linguistic semiotic systems can be reformulated as concerning their expression-substance, and how this affects the previous question.

2. Cinema as a semiotic system

The Saussure-ian tradition of opposing the concept of natural semiosis has found in cinema one of its most contested cases. Cinema seems to combine the greater number of ill-fitting characteristics, as its expression-substance is both complex and heterogeneous, the central component of which consists in moving, photographic image.

The main definitional questions with regard to cinema were already opened by Christian Metz’s inaugural text “*Le cinéma: langue ou langage*” (1964): (a) whether it is appropriate to study cinema as semiosis and (b) what kind of semiosis it is. The first question is implicitly answered in the affirmative by the very act of a semiotic approach. Then, comes the need to define what is particularly ‘cinematic’ about cinematic semiosis. This means, firstly, the distinction from the other kinds of semioses, which amounts to the question of specificity. Secondly, it means the distinction between what is cinematic as opposed to what is filmic, in other words what belongs to the code of this semiosis and what to the messages/texts it produces. Finally, it also means to distinguish cinema’s elements that belong to the realm of the semiotic from those that don’t, considering that, apart from a signifying mechanism, cinema is also as a social institution, including an economy, a technology and a power structure.

The semiotic identity of cinema, as recognized – but not defined – by its expression-substance, can be situated in four areas. Firstly, it includes images. It shares this characteristic with other semiotic systems, such as painting, all of which are addressed by visual semiotics. Secondly, it shares with photography the specificity of using photographic images. This characteristic was given exceptional importance by André Bazin, who argued that it radically affected cinema’s and

photography's ontological status. In this, cinema differs from animation, as well as from digitally produced films. The present essay, nevertheless, argues against this distinction. Thirdly, cinema uses a succession of static images in order to create the impression of moving image. Moving image is its *differentia specifica par excellence*. Cinema was born when technology made moving image possible, and even in speaking films this remains its definitional characteristic. Metz considers as specifically cinematic codes the ones pertaining to the moving image, while Umberto Eco identifies the cinematic code with the moving image. Fourthly, cinema since the 1930s, includes auditory elements; it is a complex audio-visual system. As Metz has conceptualized it, cinema's multiple expression-substance is composed by five elements: moving photographic image, writing, speech, music, noises (1964: 71; 1971: 10, 17–18; [1973] 1977: 112–113). Eco disagrees that this complexity pertains to cinema's *langue* level, arguing that it takes place in the discursive level of film. This point is not so important in the present argumentation. Finally, a whole other group of questions arise from the fact of cinema's multiple, complex and not fixed articulations, which are also beyond the scope of the present essay.

The essay's working hypothesis is to accept cinema as functioning at the epistemological level of *langue*. It considers cinema as a signification system, by which is meant what underlies the way that every film produces meaning and which makes this production of meaning possible. It accepts, following Eco, that "semiotic systems do not necessarily have two articulations; [and that] the articulations are not necessarily fixed" ([1976]1979: 231).

A provisional attempt to apply Hjelmslev's stratification on cinema could propose the following organization: Cinema's form articulates multiply its semiotic substance, in a way combining Eco's triple articulation and the articulations of audial elements. Cinema's expression-form relies on two spatial and one temporal dimensions. Its expression-substance 1 is comprised by the perceptive image of moving light and shadows, as well as sound. Its production-expression-substance 2 includes the processes and conditions of *mise-en-scène*, shooting, post-production etc. Its reception-expression-substance 2 includes the processes and conditions of reproduction, projection etc. Its expression-substance 3 includes from the light and sound waves to the recording materials.

3. Naturalness as a relation to the referent reality

A common group of arguments about the increased "naturalness" of cinematic semiosis relies on its assumed motivated relation to its referent reality. In order to formulate the terms of the problem, an aspect of Charles Sanders Peirce's theory can be of use. One of the trichotomies proposed by Peirce classifies signs, according to their relation to the referent object, into: *icons* (similar to it), *indices* (causally connected with it) and *symbols* (arbitrarily linked with it). The two first categories appear to describe a more "natural" connection than Saussure's tradition would accept. Cinema semiosis has been conceptualized both in terms of iconicity and indexicality.

Before verifying whether cinema's sign-function is iconic and/or indexical, one has to investigate whether the so-called iconic and indexical signs have indeed a natural relation to their referent. Umberto Eco refutes this fundamental precondition. He considers the icon-index-symbol trichotomy as "untenable", first and foremost because it "postulates the presence of the referent as a discriminant parameter" ([1976]1979: 178). One must remember that the referent is not really an object but an abstract entity and a cultural convention (66), while – most importantly – signification has nothing to do with the existence of a corresponding object (62). That is why we can tell stories about the gods and lies. Eco proceeds to show the conventional character of the constitution of all the so-called iconic and indexical connections, one of his central arguments being the necessity to learn to recognize them as such.

The concept of iconic sign attributes particular metaphysical properties to the image. Eco investigates several aspects of this concept (viii, 178, 190–217, 231–234). Firstly, image is often considered as a non-analyzable primal entity. This would mean that the frame is the absolute *primum* in cinema sign-function, as Metz seems to think. However, Eco proceeds to show that image is both analyzable and coded. Inspired by Prieto, he proposes a list of the codes pertaining to image, and their articulations, and then a classification of all codes according to their articulations, including the cinematic triple articulation ([1968]1972: 596–598, 601–603; [1966]1976: 215–217, 225–227; [1976] 1979: 231–234). Secondly, the traditional philosophical definition of image relies on the concept of similarity. This resurfaces in Peirce's definition of the iconic sign as linked to its object by similarity. Eco begins by problematizing the concept of similarity itself, showing that its definitional relation to the image is circular. He then proceeds to show that the recognition of similarity between images and objects is constituted conventionally. Thirdly, image is sometimes considered as caused by the object, as is the case of an imprint, which leads us to the discussion of the concept of index.

The concept of index is defined through a causal link or a physical connection to the object. Eco's critique of the concept intersects with many parts of his theory of semiotics ([1976]1979: 115–119, 161–165, 178, 186, 190, 219–224). Firstly, he observes that the signification of the so-called indexical sign does not really depend on its connection to its object, because it exists irrespectively of the existence of its supposed cause. For example, smoke as a sign of fire continues to signify it even if there is no fire at all, and it is caused instead by dry oxygen. The inferred cause is “pure content” (221). Secondly, the very act of inference, i.e. the attribution of causality, relies on a convention. Thirdly, the choice of this particular perceptual unit as a signifier for this particular content-unit, i.e. the constitution of the sign as a sign, is conventional.

In the case of photography and cinema, however, the issue of indexicality appears in its more literal sense. The traces on film made by the physical, mechanical and chemical interaction between light, camera and film are indexical not as signs but as physical objects. They do constitute proof of existence of something; the question is what of. Using Hjelm's extended model, one realizes that this link does not connect the signified (content-form) to its referent (content-substance 3), but the material trace (expression-substance 3) to its material conditions of production (expression-substance 2). Therefore, it does not affect the conventional nature of photographic (and cinematic) semiosis.

4. Universality based on human nature

Another group of arguments supports a certain universality of the systems of signification, as based on the shared nature of the human species. Although by no means limited to the visual semiotic systems, this line of argumentation has found a particularly fertile field there. The turn toward biology has become increasingly dominant since the 1980s. The present essay addresses some aspects of the arguments developed in the frame of the so-called “cognitive film semiotics”, which draw their concepts from the cognitive sciences, pragmatic linguistic theories and Noam Chomsky's linguistic theories. They develop in clear opposition to the basic epistemological premises of Saussure's tradition of semiotics. They tend to be more compatible with Peirce's semiotics, which does not postulate fundamental semiotic arbitrariness, and its subsequent ontological priority of the system over the unit and centrality of the social. Cognitive semiotics is the last step of a shift of research interest from *langue* to *parole/text*, to the textual traces of enunciation, to the empirical act of communication, to the mental faculties of cognition and perception of the empirical people who partake to this act.

One should start by confirming that there is an undeniable causal link between our natural faculties and anything that we do, including constructing and using systems of signification.

Already in *Cours de linguistique générale*, it is clearly stated that the ability to create semiotic systems is natural to the human species, while communication takes place between human beings. The significant difference is the locus and nature of this causal link. What we share, according to Saussure, is the semiotic faculty, i.e. the ability to create semiotic systems. What is common between those systems is their constitutive structure, what Hjelmslev calls *sign-function*, not their exact form. The relation between the human semiotic ability and the different semiotic systems is one of *condition of possibility*; unlike the relation between each semiotic system and its instantiations, which is a relation of manifestation. Moreover, when Saussure-ian semiotics discusses the human semiotic ability, it does not enter into the discussion of its biological grounding. The grounding without any doubt exists, and it is a fascinating area of research, but it is of a different epistemological order than semiotics. This distinction of epistemological order is crucial not to be crossed lightly; for the same reason that when we fly, we generally prefer a pilot in the cockpit and not a physicist, no matter how excellent the physicist is and despite the fact that flying planes is based on physics.

The other component of this group of arguments is their emphasis on the individual speaker and their dissolving of the social level of signification. From Chomsky's "competence" and "performance" to Donald Davidson's "prior" and "passing theory", there is nothing left between the individual and the act of communication. Theorizing the individual as a bearer, on the one hand, of innate abilities and/or conceptual structures and/or universal conceptions, and on the other, of an unstructured and accidental mass of experiences, leaves no space for the fact that meanings are socially constructed and organized. The emphasis on the speakers has often been explained as an effort to celebrate their freedom, as opposed to the supposed passivity which has been attributed to them by the concept of *langue*. However, the scientific invisibility of social structures does not entail their disappearance but rather their interiorisation by the investigating subject.

The idea of universal cultural conceptions in the strict sense is easily counter-argued, if not completely refuted, by the findings of the sciences of history and anthropology. An easy example are the different divisions of the color spectrum throughout history and in different societies, fact which opposes the proposition that color terms are cultural universals; while the connotations attributed to them diverge even more widely, problematizing any ideas of an instinctive response to them. A more plausible approach would be the one exemplified by the research of Chomsky on deep structures and universal semes. One can conceive of the existence of some very general and very abstract structures underlying all semiotic systems, other than their constitution as semiotic. Nevertheless, the double danger facing the effort to locate them, is either the unconscious "universalization" of one's one culture or the "substantiation" of one's metatheoretical constructions. In the case of cinema, efforts of formulating a cognitive film grammar have led to simplifications, such as the identification of the concept of "grammaticality" with temporal and logical linearity in narration by Dominique Chateau (Buckland 2000:126–130).

A more extreme version of universality arguments grounds signification not in our mental capacities but on the literal physicality of the human body. The paradigmatic case are is the theory by George Lakoff and Mark Johnson, who introduce image-based, embodied and *inherently meaningful* schemata, based on metaphor and metonymy. As Warren Buckland explains, these are considered "inherently meaningful because they gain their meaning from the body's innate sensory-motor capacities" (40). He then proceeds to present the example of their "container schema": "The container schema, which structures our fundamental awareness of our bodies, is based on the elements 'interior', 'boundary' and 'exterior'. [...] Sometimes, theories are understood in terms of a particular container, a building" (42–43). An obvious counter-argument arises here from the undeniable fact that there are cultures – and individuals – who don't conceptualize either bodies or buildings as containers. When I compare theories to buildings I base

the analogy on their attribute of being constructed and structured; and I suspect that this is the underlying metaphor of structuralism too. In any case, what one deals with here are connotations – metaphors and metonymies indeed – which are socially and historically constituted and by no means “inherently meaningful”.

However, the crucial axiom of both subtle and crude embodiment approaches to signification is that the properties of “the fully grown body are shared (uniform and constant)” (42). The first difficulty then is to whose body one refers. The body of a Scandinavian woman or a Pigmy man, a crippled 20-year-old medieval farmer or an athletic 60-year-old Hollywood star? There is no such thing as the typical human body. The process of defining which characteristics to consider typical is entirely social and entails the danger of normalization. Secondly, what such theories should not underestimate is the social conceptualization and construction of the body as such; this complex multi-way interaction between society and nature.

5. The debate over aesthetic realism in film theory

In film theory, cinema’s assumed privileged relation to reality has had different foundations, some of which this text has already investigated. The most naive is the notion of cinema as an unmediated opening to reality, as a “window” or “mirror” or “slice of reality”. This position is easily refuted by a listing of the technical mediations and creative choices that lead to a film’s construction: from the choice of what to shoot and the manipulation of the pre-filmic elements to the frame and shooting choices, from decoupage and editing to sound-design and mixing. A certain improvement of the previous notion conceives cinema as a neutral recording of an already-coded reality, or – according to Pier Paolo Pasolini – as a secondary writing of the language of reality. This formulation still greatly underestimates the amount of choices and the degree of manipulation this “recording” allows or, rather, necessitates. A third, fourth and fifth lines of argument are based on concepts of iconicity, indexicality and the literal indexicality of photographic technologies, all of which have been addressed previously in this essay. A final line of argument is based on the richness of the sense stimuli cinema provides. The greater the range of sense stimuli an art involves the closer it comes to our experience of reality, the argument goes. It founds cinema’s assumed closeness to reality on a persuasive virtuality.

The last line of argument displaces the discussion from the belief that cinema has a privileged relation to reality to the observation that it *gives the impression of* having such a relation, and to the subsequent question of why it is so. This is cinema’s famous concept of *impression, illusion or effect of reality*, which practically means the forgetfulness of the fact that a film is constructed. There are three groups of reasons given for this impression. The first group is inspired by the cognitive sciences, and looks to the constitution of human perceptual apparatus, starting with the *phi*-phenomenon that allows us to see as continuous movement the rapid succession of static images. The second draws on psychoanalytical concepts and research, and explains the function of identification mechanisms. The third group of reasons relies on internal coherence and previously constituted conventions of representation.

These issues have been entangled in the history of cinema theory with the different aesthetic ideologies regarding realism. In this context, the questions of what cinema is and how it functions have been subordinated to the ones about what is a good film and what kind of films should be made. These were always intertwined with ethical and even political issues. Realisms and counter-realisms are all based on some notion of truthfulness, conceptualized in different ways as verisimilitude, immediacy or sincerity. The complexities of this debate exceed the scope of the present essay (see Walldén 2012b). What is relevant though is the realization that the “naturalization” of construction, the forgetfulness of the existence of the medium, results in mystification.

6. The debate over the biological foundation of social and human sciences

The discussions around the naturalness of cinematic semiosis in particular, and semiosis in general, are framed in a much wider epistemological debate, regarding the biological foundation of social and human sciences. The effort of “modeling” the human and social sciences on the natural ones is as old as modern science itself, since the Enlightenment, considering that in the process of constitution of the sciences as sciences, natural sciences have been the leading and paradigmatic case. However, there has been a wide range of such efforts: from structurally incorporating methodology to borrowing specific concepts. The foundation of a social or human science on human biology has been one of the most common and the least successful ones – one has only to remember Social Darwinism or Freud’s early efforts to ground his findings on literal human anatomy.

The recent rapid progress in brain and genetic sciences, as well as in theoretical physics, has left the human and social sciences with the feeling that they have been left behind. This feeling is partially justified. It is true that 20th century positive and natural sciences’ findings and hypotheses are yet far from being incorporated into the cultural consensus and everyday lives of our societies. However, one has to realize that the generalization of Newtonian physics into the General Relativity theory does not affect at all the way we build houses; while something much smaller but of a similar epistemological order to building, such as the invention of a new material, does. While the human and social sciences must certainly revise and contemporize the ways they intersect with the positive and natural sciences, it is also useful to question the very validity of such intersections; have they been really essential to their theories, or have they been used as legitimizing devices ultimately inessential to them? Most important is to remember that historically such efforts have been usually unsuccessful. Now that this tendency is once again fashionable, it is useful to address the reasons of this lack of success.

Firstly, quite often they ignore or underestimate historical and anthropological observations. This tendency was presented previously in this essay. Secondly, they often misunderstand the scientific findings they refer to. They may generalize local results, turn scientific hypotheses into axioms, or ignore in other ways the constraints of a specific theory or research. The third and most common problem though, is the way that is enacted the connection between the social science and its assumed-as-grounding natural science. This connection, this passing from one epistemological order to another, is one of the most difficult moves that our sciences have to address. The dangers facing this effort are two: reduction and metaphor. The former is the result of the oversimplification of both sides of the division and the collapsing of the two epistemological orders into one, or their unproblematic immediate link. Examples of such a reduction is the explanation of class structure by evolutionary biology or the interpretation of an emotional statement as an advanced form of instinctive stimulus-induced reaction. The danger of metaphoric use consists in a term or a group of terms being detached from the system that defines them and transported over the epistemological divide, in either direction, losing in the process their initial meaning. This is the case when one uses quantum physics’ terms in narratology or argues about the linguistic capacities of genes. What is the common factor in this wide range of fallacies is the naturalization of the social. And the stakes of such a move are very high.

Conclusion

This essay has argued for the social construction of cinematic semiosis in order to support the Saussure-ian approach to semiotics in general; and specifically its epistemological premise of the fundamentally social and constructed status of signification. It has proceeded to frame this discussion into the wider debates over aesthetic realism and the biological foundation of the social sciences, both of which have political implications. Particularly the latter locates a crucial

decision that the science of semiotics has to take, which will determine its future development.

As we have seen, one of the leading contemporary tendencies in semiotics is an effort toward “naturalization”. This can be explained to a certain extent by the desire to gain the status of natural sciences, which is perceived as higher. I argue that, although historically understandable, this effort is mis-oriented. On the one hand, it seems to forget that what constitutes an endeavor as scientific are the criteria of scientificity, such as refutability and the ability to predict future results, not an uncritical borrowing and misapplication of other sciences’ theories. The enthusiastic but uncritical endorsement of the natural sciences amounts to an ideology of scientifism, and a subsequent loss of scientificity. On the other hand, it seems to forget that if significations are not conventional, then they are independent from history and, therefore, unchangeable unless by biological evolution. This amounts to the unchangeability of the status quo; a very conservative, even reactionary, world-view. In a single move, semiotics has managed to both lose its critical dimension and eternalize the status quo! Last but not least, one is not allowed to forget that racism is also based on the naturalization of the social.

In conclusion, the naturalization of the social is a definitional characteristic of ideology. In Louis Althusser’s words: “One of the effects of ideology is the practical denegation of the ideological character of ideology by ideology” (1970). For this reason, as Metz put it in 1978, “la sémiologie [a une] allergie radicale a l’idée de ‘nature humaine’ [semiotics has a radical allergy to the idea of ‘human nature’]” (1).

One upon a time, semiotics launched its project as an uncovering and dismantling of ideology. What will its project be for the future?

SEMIOTIC SPACE AND BOUNDARIES – BETWEEN SOCIAL CONSTRUCTIONS AND SEMIOTIC UNIVERSALS

Tiit Remm
University of Tartu, Estonia
tiit.remm@ut.ee

Abstract

This paper studies the opposition of social construction and cultural universals in the field of space and spatial metalanguage in social and cultural research. In more detail I focus on the notion of ‘boundary’ and its object, asking how can an understanding of semiotic and spatial nature of boundaries help social and cultural research?

I argue that ‘boundaries’ should be considered being by definition of semiotic and spatial character. This leads to the understanding that boundaries (as far as there is a reason to consider them namely boundaries and not for example, *mediation*, *translation*, *explosion*, etc.) are, first, depending on recognition and distinction by some subject and, second, enforcing spatialization of the distinction. Thus, bounding is a practice of semiotization that dynamically interrelates levels of conceptualisation and levels of spatiality. The latter is based on the semiotic understanding of space as being grounded in relations of co-existence and their recognition by at least an indexical *umwelt*.

While boundaries are semiotic and often descriptive social constructions, there are also aspects of boundaries that can be approached as cultural or even semiotic universals, most notably so-called boundary mechanisms and basic semiotic nature of space and spatial distinctions.

The paper concludes with exploring the applicability of the theoretical argumentation for a semiotic approach in archaeology. In what sense can we talk about cultural boundaries in research, as social constructions or cultural universals, as parts of object level world image or parts of researcher’s models, as material objects or as structural relations? How can we find

boundaries in fields like archaeology and how can we improve our knowledge by considering these boundaries?

Boundaries and the concept *boundary* are in semiotics and humanities often discussed either in a theoretical manner or in contrast, limited to particular applications and less as a comprehensive semiotic framework for analyses. Considering *boundary* in the context of spatial metalanguage highlights the tensions between social constructions and semiotic universals present in searches for applicability of semiotics in archaeological studies (see also Lagopoulos 2003, Lang 2005, Preucel 2006).

For methodological purposes boundary mechanisms are important object-level phenomena that enable a grounded construction of study object, for example, in archaeology where any cultural phenomena appears as a study object exclusively through re-construction. Boundary as *spatializing distinction* and traces of boundaries can be seen as traits to be looked for when studying the sociocultural world. Boundaries could thus be added to the list of patterns of uniformity, uniformity of relationships and identity of meaning or logical coalescence that Pitirim Sorokin has pointed out as traits that should be looked for when studying the sociocultural world (Sorokin 2006: 9–10). However, there remains the question of limits of employing the concept and possible changes in applying it. In the context of Juri Lotman's notion of *semiosphere*, boundary might appear as a universal basic element of semiotic world. However, a closer look reveals also the specificity of the notion and object of *boundary* which suggests that it is not a universal unit of description of the semiotic universe but has its heuristic limits.

I argue that *boundaries* should be considered being by definition of semiotic and spatial character. This leads to the understanding that boundaries (as far as there is a reason to consider them namely *boundaries* and not *mediation, translation, explosion*, etc.) are, first, depending on recognition and distinction by some subject and, second, enforcing spatialization of the distinction. Thus, bounding is a practice of semiotization that dynamically interrelates levels of conceptualisation and levels of spatiality. The latter is based on the semiotic understanding of space as being grounded in relations of co-existence and in recognition of these by at least an indexical *umwelt*.

Boundary is spatial. The statement might seem obvious and uninformative. It is crucial however to note that also the most abstract kind of boundaries are spatial. They are spatial as descriptions and projections. Thus, observing and cataloguing numerous boundaries is not enough, one needs to understand different kinds of spaces behind them. For example, Cassirer's distinction between *actional, symbolic* and *abstract space* (Cassirer 1944: 42–43) can be taken as a starting point here. These refer respectively to the geographical spatial dimension of practices, organisation of world image and self-descriptions, and to abstract category of space that can be used as a modelling tool.

Spatial metalanguage is a tool of cognition applying sets of spatial relations for representing organisation of the object field. Aimed for adequacy and usefulness of descriptions metalanguages can be based on different concepts of space that combine spatial relations in variable ways. In one dimension, this abstract conception of space is derived from particular world image and symbolic space related to it, which is again based in spatiality of practices. In another dimension, this abstract space as a spatial model is aimed for representing the object field which involves its own symbolic space of world image and spatiality of practices in it.

From a semiotic perspective *space* can be defined as a set of recognized spatial relations. The latter, spatial relation refers again to a situation of at least duality in object field or co-presence of two objects. From the semiotic perspective the recognition of this duality of actual or potential objects by someone is essential. While this minimal spatial relation can involve two objects, one

of these could also be the recognising agent as an object of recognition or alternatively, it can be the environment as an object of recognition. According to this view, the mere relation and gap between subject and object ought not to be considered spatial as long as it does not involve distinction of the object from something else. In discussion of the ontological basis of socially organised geographical space, Edward Soja emphasizes the human ability to objectify the world by distancing oneself from the object world, conscious human distancing from inanimate objects (Soja 1989: 132). In my view, the situation of recognising a dual relationship in the object world requires a recognising subject of some kind with at least indexical object-world. Thus, an animal Umwelt (according to Kull 2010) is required but not necessarily a *conscious human person*. In addition, it is reasonable to consider the distancing between a subject and its environment as *spatial* as long, as it involves both parties as objects for the subject-agent (or as Soja characterises *existential alienation*: “a state of separation from oneself and from the objective world” [1989: 133]), in other words, as long as the semiotic situation involves the act of bounding. The requirement of co-presence of objects points to an essential aspect of semiotisation – objects that are otherwise not possibly co-present in actuality can be brought together by semiotic mediation – by actualising a past object by remembering it or combining representations of various near, far and imaginable objects into co-existence in one “cognitive space”. As space is based on recognition, it refers first of all to the organisation of knowledge and through this to the organisation of the object of knowledge.

According to this basis, there is a potential for different spaces – differing by involved relations and their variable organisations. As the minimally presumed duality can involve either two objects or an object and the subject as its own object the general primacy should not be attributed neither to ego-centric nor non-egocentric orders. The notion of *space* should thus be understood as a holistic set of recognised spatial relations. Regarding the concept of boundary, it should be kept in mind that there can be different ways of organising spatial relations into a holistic *space*. This results in heterogeneity of spatial metalanguages.

Considering *space* as a set of recognised spatial relations, it is necessary to understand the kind of *space* related to the boundary and interconnections of different spaces through boundary. For example, institutionalised borders relate abstract and symbolic spatiality to practical one and they are expressed and forced by material means. Boundaries in the context of non-spatial phenomena exist in relation to spatial descriptions. Constituting a boundary is at the same time spatializing the object and thus it should be asked, of what kind, at what level, and of which significance is this space.

Besides being spatial, boundary is fundamentally semiotic in the sense of being based on recognition. The mechanism of boundary can be found in distinction, more specifically in spatialising distinction. It is basically recognising difference by someone, thus, it is not a mere difference, but an act of distinction – with a particular agent and its perspective, relational in nature and concerning certain level of abstraction. From an external perspective, boundaries might appear ambivalent and arbitrary, from the perspective of the “world” of the boundary, they are however rather concrete and indispensable.

The boundary as a distinction depends on subject’s recognition and interpretation. *Distinction* as a way of organising space reminds the works on *social space* by Pierre Bourdieu – which is an interesting connection here. According to Bourdieu (1994: 24–25), who relies on Émile Benveniste, the significance in social space is essentially difference that creates difference or distinctive distinction that requires subject with specific competence or in other words, subject situated at the particular *field*. It is remarkable that Bourdieu did not discuss *boundaries* themselves, boundaries of a social class for instance. That would probably be because while he was concerned with *distinctions* he did not focus on descriptively outlined wholes and their rela-

tions. In Bourdieu's context, acts of distinctions can be seen related to boundaries but they do not set up wholes with the distinction of co-existent internal and external domains. The holistic dimension for him is instead in *social space* where distinctions are made and could be seen as episodes of internal boundaries. Constituting a systemic hole from these would presume additional conceptualisation – e.g. in the form of explicit description of social classes and belonging *in* one or another.

For Lotman, in contrast to Bourdieu, *boundary* is a central notion in semiotic study of culture in relation to notions like cultural space (1975), semiosphere (2005), text (1977) and explosion (2009). The notion of boundary in Lotman's theory has also been extensively discussed (e.g. Andrews 2003; Kim 2014; Monticelli 2008, 2012). Lotman's proposal for topological metalanguage and the notion of *cultural space* is based on the idea that boundary divides otherwise homogeneous space into distinct internal and external space (Lotman 1975: 104). Similarly, semiosphere is characterised by the external boundary and organised by heterogeneity of internal boundaries. For the semiosphere and its each part or sub-sphere, there is a *semiotic I* from whose position the boundary is constituted (Lotman 1990: 138). The function of boundary is to filter and adapt the external into internal (1990: 138). Boundary is thus the distinction made by *semiotic I* between its own semiotic space and that of not, the distinction that both bounds and mediates. Semiotic space again is here not merely a set of semioses, but a particularly organised domain of semiosis, the domain of *semiotics of particular culture* as distinguishable from alternative ones (Lotman 1990: 125). In this sense, the space of semiotics of a culture is comparable to the notion of *signifying order* as the basis of culture: "a complex system of different types of signs that cohere in predictable ways into patterns of representation which individuals and groups can utilize to make or exchange messages" (Danesi, Perron 1999: 67).

In Lotman's conception of *boundary* three functions have been highlighted: "(1) the boundary as an instrument of internalization, separation or closure; (2) the boundary as an instrument of connection [...]; (3) the boundary as an instrument of differentiation, the acceleration of semiotic processes and the generation of newness" (Monticelli 2008: 193). The first one is related to the *metasystemic self-description*, the perspective of the *semiotic I*, which centralises and draws the external boundary of the internal homogeneous structural whole. The second function is related to the boundary as a dialogical mechanism providing partial translatability of at least two different systems, so to say intersystemic play: "The boundary as bilingual belt and space of intersystemic play is the place where the homogeneity of the structural whole is suspended in order to make dialogue possible" (Monticelli 2008: 200). Envisioning this connective boundary as a space of its own, Monticelli equates for the third function this *border-zone* or *boundary-space* with Lotman's notion of periphery.

This equation is however partly misleading. Boundary and periphery can overlap in spatial imagination as well as in empirical material and Lotman also refers to the *periphery of periphery* as a border area (1990: 141). However, as analytical categories *boundary* and *periphery* are significantly different and are related to distinct spatial structures and distinct perspectives. Boundary separates internal and external space and should be understood namely through this relationship. *Periphery* is a binary notion with *core* or *centre* – which is the domain of dominant organisation and self-descriptions, periphery in contrast the domain of dominated and heterogeneous organisations and processes. As a *separating instrument* boundary separates the internal from the external (system from its environment or from another system) and is the marked element of self-descriptions. Periphery and centre are instead aspects of the internal organisation of the system. For spatial self-descriptions boundary would be the marked element (the dominant organising factor), the marked element for systems internal organisation would in contrast be the centre which defines the *type of semiotics* characteristic for the system and defines what remains

peripheral. While spatial discreteness is crucial for boundary, continuity is emphasised in relating centre and periphery. At the same time, the semiotic mechanism of periphery is indeed close to that of connective function of boundary: active mediation of the own and the foreign. However, a dominant feature of culture can be active interaction with the external domain, which should be described as positioning the cultural centre or core on the boundary of culture. This can be found not only in the case of founding St. Petersburg, referred to by Lotman, but also as a typical trait in the culture of large cities in general. This poses also a typical problem for talking about boundaries in archaeological material – in what sense should e.g. grave constructions be considered as articulations of cultural centre or boundary and of what kind, related to what cultural subsystem or activity?

Thus, in addition to the distinction of perspective from inside of the culture and scientific metalevel, related to separating and connective boundary respectively (see Lotman *et al* 2013: 53) a dynamic plurality of perspectives, wholes and boundaries can be found in the interactional reality of sociocultural world.

There are three points to be emphasised in the basic Lotmanian idea stating that boundary separates semiotic space of a culture (or some other system) from its environment. First, (1) boundary and the distinguished space are described from the perspective of the culture. Second, (2) it is not a *semiosic space* as congeries of semioses but namely *semiotic space* as more or less coherent system of semioses for which boundary has the function of constituting the whole and thus spatializing and also has the function of textualisation. As a whole this semiotic space has its characteristic *type of semiotics* and thus recognition of boundaries by an observer presumes the textualisation already at the object level (e.g. in considering a culture or a city as a text and not as a language like system). Third, (3) the notion of space needs to be contextualised. Space as an organised whole is based on a set of recognised spatial relations; boundary and bounding as making distinction forms this spatial whole. This reveals that expressions *domain*, *space* and *sphere* (*oblast*, *prostranstva*, *sfera*) in works by Lotman and colleagues (e.g. in Lotman *et al.* 2013) should not be taken as random but referring to levels of semiotic organisation. *Domain*, as in distinction of *cultural* and *non-cultural domain*, referring to a set of relations and differences where there can be limits but not significant boundaries. *Space* referring to distinction, organisation and spatialisation of differences, particularly by boundary. *Sphere* denotes again a particular form of organisation of relations where bounded area is characterised by internal structure through centre and periphery and several sub-spheres.

In his *The structure of the artistic text* Lotman defines space of an artistic text as a set of objects purified from all traits except those regarded as similar to ordinary spatial relations (contiguity, distance etc) (Lotman 1977: 217–218). This is a clear example of the use of *space* as a modelling tool. Lotman refers to abstract space also when discussing the concept of semiosphere (Lotman 2005). Indeed, semiosphere applies a concept of space as a modelling device. However, the spatiality becomes an object there: the semiosphere is a system that takes its spatial organisation as an object of structuration. The process of structuration involves the definition and dynamics of boundaries and relations of centre and periphery that respectively appear not primarily as spatial but as systemic traits.

While boundary is spatial, boundary-like mechanism can be more general. *Mediation*, *disruption*, *explosion*, *crisis* are all notions about similar mechanisms without actualising specifically spatial aspects. Conceptualising something as *boundary* would thus require considering its difference from other possible mechanisms of distinction and mediation.

Cultural distinctions and boundaries are not merely ideational but they are also applied and objectivated in interactions and in particular environments. This corresponds to the position that sociocultural systems or *enactments of ideational designs-for-living in particular environ-*

ments should be studied (Keesing 1974: 82) and makes boundaries tangible and valuable elements for researching cultures. Talking about cultural boundaries is talking about cultural space and respectively, some particular way of thinking about culture. Thus, it should be asked, what does the notion of boundary actualise in theories about culture and on the other hand, how do these boundaries exist in empirical world? For example, considering landscape as environment as understood by people, it appears a vital issue to recognise significant boundaries in the surroundings and also inventing and marking the boundaries. Boundary is in this case an object of recognition linked to the environment and the way of relating to it but not necessarily a part of the physical environment.

Culture is constantly relating to its boundaries and creating them. The act of establishing a boundary is also creation of semiotic reality and its objectivation. Articulating boundaries generates (1) the shared knowledge of the boundary and thus also (2) the limits of respective signifying order. A central basis for culture can be found in ability to share one's ways of orienting towards the world (Parsons, Shils 2008: 162). Establishing a boundary constitutes an area where a particular way of orienting to the world is shared and also controlled. Beyond the area of common *type of semiotics*, establishing the boundary establishes also the place for sharing different ways of orienting towards the world, for meeting cultural *Others* physically and more importantly, informationally.

In studying culture and history, theories are not merely interpretational frameworks but they are crucial for constructing research objects. Thus, attention to cultural boundaries involves particular conceptualisation of culture as well as particular roles of boundaries in these conceptions. Besides being elements of abstract spaces, boundaries are also essential means of making sense of the world at the object level or practical relationship to the world. The potential involved in combinations of these aspects is what makes boundaries valuable for studying culture – and makes semiotic perspective valuable for archaeological inquiry.

In the following I outline some preliminary points in a study aiming to bring together semiotic and archaeological perspectives on boundaries.

Essentially semiotic and spatial, boundary is a tool for making sense of the world – cultural universal and social construction. Considering that existence of a *boundary* presumes a subject making the distinction and some particular kind of spatiality as a framework for the boundary, it is central to ask who is the deciding subject, what kind of spatiality is involved and what is the focus in drawing boundaries in archaeological study on culture? Three main domains of boundaries in archaeological study of culture should be pointed out. These are:

- 1) the domain of constructing and delimiting the research object;
- 2) the domain of theoretical models explaining culture;
- 3) the domain of world view or cognitive reality of the studied community itself.

The first one is focused on the metalevel, aiming

1.a) for defining or localising the research object in chronological and geographical dimensions, understood in a universalistic manner; this can involve bounding as a method for object construction but not necessarily.

1.b) Further, this domain can aim for classification of artefacts – that is, projection of constructed wholes and boundaries to the level of study material and finding differences or breaks in unities to represent boundaries. In essence it is integration of common traits into unities and interpreting lack of unity or of artefacts as boundary. A concept characteristic to this domain is *archaeological culture* as a concept targeted essentially for organising excavated material into some kind of wholes (see also Roberts, Vander Linden 2011, and more particularly in East Baltic context, Lang 2005). Presuming existence of these “cultures” in past reality should be considered as retrospective projections.

The second domain involves boundaries more directly but as elements in theory building and explaining culture, that is, as spatial modelling tools. This approach presumes there to be a culture at the object level, culture that needs to and can be explained. There is a variety of definitions and theories of culture. Boundaries have different roles and nature depending on the conception of culture. Further, boundary can have the role of delimiting the semiotic world of a culture:

- 2.a) drawing the distinction between culture-object and that of non-culture or
- 2.b) an element in a theoretical model explaining the functioning of culture.

While both of these take their spatial conceptions from the metalevel, they can also involve significant distinctions made by the object community itself. The first one aims to delimit and define the object namely as culture, the second one focuses on explaining cultural functioning. A good example here would be the concept of *semiosphere* with its external and internal boundaries. Semiospheric boundaries represent distinction making at the object level but their spatiality is depending on the theoretical framework at the metalevel that often involves also interdisciplinary mobility of concepts like *sphere* or *field*. Differences in archaeological artefacts are common and have been made by archaeological subjects, part of them also recognised as differences. Thus it is possible to model functioning of culture on these observable similarities and differences as patterns. However, there are two major problems. First, archaeologists find extremely small portion of the material culture of only small segments of past communities. Second, as long as a model of functioning of culture involves attitudes of people towards each other, things and life in general, the model remains highly hypothetical.

This takes us to the next type of boundaries – namely asking about distinctions that existed for the past community itself, either explicitly as boundaries (that is, spatialized distinctions) or as functional cultural mechanisms of boundary, mediation, translation etc. The problem with this spatial distinction existing for the community is that the fact of recognition in the community is difficult to prove and it is difficult to define its particular status, e.g. being generally shared or particular, with unified meaning or diversely interpreted.

3.a) What did the community see as a boundary? Boundary can here pertain to actional as well as to symbolic spatiality (or also abstract in some cases) and can have projections between these. Spatial organisations can be various and the domains of cultural world image to which boundaries are related can be of different kind. In the context of culture as a complex system, each artefact as well as its location or relation to anything else can potentially be interpreted as being a sign of significant boundary.

3.b) For actual research it is crucial to ask, what functions as cultural boundary mechanism or mediator and translator, between what and what is the role of it in the cognitive reality of the community? Culture involves different boundaries at different levels, with different actualisations. However, to make use of the study, we need also to de-limit the object-culture and interpret it according to some model (aspects of previous points) – some possible boundaries to be more pertinent than others, depending on the research question.

Combination of semiotic understanding of boundaries with conceptions of culture could point to a way for talking about boundaries in the archaeological research on culture. Boundaries functioning in culture and existing in the cognitive reality of the community are particularly pertinent for Lotman's semiotic framework. However, Lotman suggests studying cultural world image through the material of textual self-descriptions and descriptions of the world. Availability of this textual material remains often a problem for applying semiotic approaches in archaeological study. Still, expressions of a community and its culture that reflect the world image can be found. Interpreting these is partly related to interpreting textual self-descriptions.

It is possible to presume the *subjectivity and agency* of the community in making signifi-

cant distinctions and researchers can speculate about the spatialisation of the referential system, world image. As a result we can ask about possibility of interpreting differences of excavated artefacts as *boundaries* or in other words, whether differences in artefacts (1.b) give reason to search in it mechanism of distinction according to a model of culture (2.b), for example, a *semi-spheric boundary*. The latter is related to the community's world image through the concept of *semiotic I* of the semiosphere.

In this line the framework of understanding boundary as an element in spatial metalanguage could support making connections between different conceptual levels and spaces as well as enable useful projections between object and metalevel in semiotic studies of culture.

The research has been supported by the European Union through the European Regional Development Fund, CECT and IUT2-44.

AN OUTLINE FOR A THEORY OF POLITICAL SEMIOTICS

FROM ALBERTI'S WINDOW TO TODAY'S INTERFACE. A SEMIOTIC READING OF THE SEEING METAPHOR IN THE POLITICAL DISCOURSE

Sorin Nicolae Drăgan
National University of Political Studies and
Public Administration, Bucharest, Romania,
dragan.nicolaesorin@gmail.com

Abstract

What do Alberti's *window*, Pinker's *window*, Alice's *mirror* and *the windows* proposed by the *new media* have in common? All four represent metaphors for seeing, an interface through which man is granted access to reality. The window motif updates the issue of the identity-alterity, interiority-exteriority report. We suggest the complementary solution of the "seeing", "speaking" and "understanding" operators for any grid of semiotic reading of the world.

Looking beyond the seeable (signs), speaking with purpose (conveying a cultural content) and understanding the semiotic of place (constructing meaning) represent requirements to be assumed in the political discourse.

Where is the cultural sign interpreter placed with regards to the interface? The paradoxical report them between closeness and opacity is well known. In an epistemological sense, taking a closer look at something does not mean seeing better. The issue of the subject position within the semiotic act is crucial. Sight is an incomplete instrument of knowledge, which needs the mediation of other senses in order to access the construction of meanings (Stoichiță, 2013: 82–85). It is the reason for which the construction of significance becomes an operation involving all three operators: seeing, speaking and understanding.

The paper examines the role of the imaginary, of the symbolic representations conveyed in the message construction, in the preferential enabling of certain codes, a fact which directs both the political discourse construction as well as the negotiations of power relations. Furthermore, we have undertaken to identify the constituent signs of metaphorical representations specific to the pragmatic level of political discourse, the coherence between "speaking" and "doing" (J.L.

Austin's *How to Do Things With Words*). Our hypothesis is that the emphasis on the cultural and social "genealogy" of signs (myths, images and connotations activated), including in the "rhetoric archive" of cultural tradition allows the reading of any type of reality (Beciu, 2009: 25).

1. The *Window*, Opening from Culture to Nature

1.1. A Paradigm Shift in the Theory on the Leon Batista Alberti Perspective

L. B. Alberti (1435), next to F. Brunelleschi (1425), provides Western culture the first great illusion of representation, perspectival image of reality. Moreover, a paradigm shift occurs in apprehending the window motif, the expansion of its utility function, including its aesthetic aspect, to elements which foreshadow the cognitive function. For Alberti, the painting was an open window to the world, "an open window through which I see what I want to paint" (Stoichiță, 2013: 10). Beginning with Alberti, the painting instates a new *logic of the discernible*. In the same train of thought, the window establishes a new *order of looking*, a reality constructed from the artist's perspective.

For almost half a millennium, the perspective method governed the acts of representing reality, including here Dürer's and Leonardo brushings. Another effect of the new paradigm of the looking theme captures an aspect less approached in the literature: an exemplary analysis of the forms of representing the image, of the topological structures common to painting and media configurations, derived from the window motif. The old paradigm of Western representation (Stoichiță, 2013: 65), *the window* is a virtual construction which operates on both elements of the imaginary as well as on elements of rationality. The window becomes a space for visible signs which make up reality: "Before *art*, as before *nature*, the window isolates a fraction, however it allows it to put itself forth as a new entirety." (Stoichiță, 2012: 68)

The Albertian method enables two concepts that will become constitutive to any act of representing reality in media constructions. The first is *perspective*, the other is the *story (historia)*. The two notions empower the encounter of two fundamental dimensions of human nature within the construction of a text: the idea of order (a constituent of any aesthetic text) and the idea of narrative (which activates any interpreter of a communicative act). Narrating is an event, an act of creation of great imaginative fruitfulness. The narrative act potential in the construction of the public image of a subject is recognized (Borșun, 2011: 159).

How can we understand the manner of representing reality in the postmodern society from the perspective of an archeology of looking? How do society's power struggles determine the metaphors of looking and how do they direct the screen figures?

A space for looking, *The Window* represents a margin, a threshold that invites dialogue, a crack in the image which allows the passage between myself and the World. The window motif updates the issue of the identity-alterity, interiority-exteriority report. The window invites you to experience the act of looking.

Gérard Wajcman distinguishes this screen figure as a key concept, a pictorial object fundamental for thinking (2004: 64). The French professor would go on to unveil the transparency ideology, specific to postmodern society. Its effect is to limit the individual's space of freedom, by dismissing the "desire part associated with any visual endeavor" (Stoichiță, 2013: 14), as Lacan had shown. In this context, the political discourse lies behind the connotative marks of the *transparency ideology* (the metaphoric ideal of democracy), and the media plays a special part, seductively disguised behind a *tyranny of images*.

1.2. Frame Theory and Alberti's Frames

The painting is the result of a virtual construction that starts by drafting an imaginary object

(*rectangular frame*)¹. The method described by Alberti means an *act of establishing a semiotic code*, the conventions which intermediate the function-sign construction specific to the cultural unit (*the painting*). The concept of frame is rediscovered in sociology by Erving Goffman (1974). This time, the frames represent principles by which we are able to organize human experiences, which help us define communication situation (Goffman, 2007: 268).

Goffman's frame is formal and abstract, just like the Albertian frame. The communication sciences were contaminated by the notion. Professionals in the field have become familiarized with the concepts of perspective, visibility, frame, angle, etc. The all stem from a liminal screen device, Alberti's Window.

The media interpretation frames may sometimes be construed as interpretation schemes for events in a certain context (similar to Alberti's construction). The viewer's perception is oriented by the manner of event construction. According to Iyengar & Kinder (1987: 4), the most important topics for media networks also become a priority for the public: "By calling attention to some matters while ignoring others, television news influences the standards by which governments, presidents, policies, and candidates for public office are judged. *Priming* refers to changes in the standards that people use to make political evaluations." (1987: 63)

The interpretation frame theory has become relevant from the perspective of looking metaphors and for political communication².

1.3. Case study – A Pictorial Model Becomes a Type in the Media Discourse Constructions

In short, it is about highlighting a structural isomorphism between the image configurations proposed by some aesthetic texts and the image configurations in the media discourse. The idea of establishing such an analogy stems from the theoretical approach on the issue of *classifying or of representation margins* from the pictorial texts (Stoichiță, 2012: 55). A stylized illustration of the screen, the window is one of these images establishing certain relations with the World. The representation hyper-coding, the frame windows in the media discourse form into *types* whose interpreters expand to the meaning of 15th century aesthetic discourse.

In painting *Crist in the House of Martha and Mary* (1618), Velázquez proposes a new representation paradigm. A structural composition within a typological configuration containing two representation methods: "*Alberti's window*" and "*Bamboccio's window*" (2012: 30). A duplicated image, the image whose theme is the image. The technique of overlaying frames is a configuration type familiar to the media discourse, editorially motivated by the principles of coherence and discursive cohesion. This is one of the image *types* we aim to analyze in detail. Annex No. I illustrate a mechanism of identifying cultural artifact (α_1) for one media type (γ_1).

"Alberti's window" is a metaphor of perspective method, a coherent and homogenous representation of a reality event (2012: 29). Alberti's interpreter sees reality from the artist's perspective. "Bamboccio's window" accidentally classifies a real event: it may crop a fragment from reality (2012: 30), "without deviation or alteration", similar to a live broadcast of reality. The two image levels represent two moments of reality; *introductive scene*, commentator space and *reference scene*, the fragment of reality proposed to the spectator. The interpreter simultaneously sees the two fragments of reality. Furthermore, he must operate the inter-contextual relation (hyper-coding) between the two image levels (2012: 33). The Viewer-interpreter is involved twofold in the painting, in two different manners (2012: 65). On the one hand, he visualizes the main scene,

¹ "First of all about where I draw. I inscribe a quadrangle of right angles, as large as I wish, which is considered to be an open window through which I see what I want to paint", L. B. Alberti, *Op. cit.*, p.27.

² "This process is accompanied by political communication becoming more visual, more performative, more theatrical and more aestheticized", Holly, 2008: 317.

in a dialogue with the enunciation scene main actors, almost “face to face”. We will call this initial interpretation level as a *contextual reading of the event*. On the other hand, he is oriented to view the background images. This is the reading *meta-communicational level*, where the event seems to be talking about itself.

One of the hypotheses of this study implies that perspective organizes, on the one hand, the field of vision (the selected fragment of reality) and, on the other hand, it subjects the looker’s position to this field. People learn to look at things through a filter whose configuration is fashioned by the staging of discourse (Eco, 2008: 290).

The analytical decoding scheme for a media *type-configuration* similar to a *cultural artifact*, for duplicated images, follows a procedure which implies the:

- (1) – MONITORING › (2) – SELECT › (3) – IDENTIFICATION › (4) – COMPARISON › (5) – SELECT MEDIA-TYPE › (6) – HIGHLIGHTING OF THE ORIGINAL CULTURAL UNIT SEQUENCE

Mathematical formalization of the procedure is as follows:

(6)	(5)	(4)	(3)	(1) + (2)
α_i	$\leftrightarrow \gamma_i$	$\leftarrow \omega_{t_i}$	$\leftarrow \omega_{1_i}$	$\leftarrow \omega_{1_{i1}}, \omega_{1_{i2}}, \omega_{1_{i3}}, \dots, \omega_{1_{ik}}$
			$\leftarrow \omega_{2_i}$	$\leftarrow \omega_{2_{i1}}, \omega_{2_{i2}}, \omega_{2_{i3}}, \dots, \omega_{2_{ik}}$
		
			$\leftarrow \omega_{j_i}$	$\leftarrow \omega_{j_{i1}}, \omega_{j_{i2}}, \omega_{j_{i3}}, \dots, \omega_{j_{ik}}$

$\alpha_i, i = 1 \div n$, it represents *cultural artifact i*, which serves as a topological model for the type γ_i *media frame*;

$\gamma_i, i = 1 \div n$, it represents the *type γ_i media frame*, which was selected to represent the frame category topologically similar to the α_i topological model, of all the j media stations emblematic frames;

$\omega_{t_i}, i = 1 \div n, t = 1 \div j$, it represents the *emblematic media frame* for television station t , selected from its own category to represent frames topologically similar to *cultural artifact i* (assuming that we have identified a number of “ k ” topologically similar frames);

The initial stages imply the accomplishment of abstraction processes, from which to only retain the objects containing topologically pertinent traits. The final stage (6) implies a special semiotic labor. The highlighting of the referent (cultural artifact), implies the vectorialization of various competence types in terms of pertinently identifying an original group. An important role in the success of such operations is granted to *encyclopedic competence*, understood in terms of a language-independent world cognition (Borțun, 2011: 59).

One of the fundamental tenets of this paper is the updating of the looking motif, of its epistemological evolution and transformation in all forms of reality construction, from the tradition of painting to narration, from cinematic to media discourse.

2. The World Seen through the Window of Alberti and Pinkler and Sometimes through Alice’s Mirror

The window admits a consistent semantic freedom and allows the association of visual devices that share certain similarities, such as the mirror, for example. The mirror allows looking “*through*”, while the mirror allows looking “*in*”, although, in many cases, looking “*in*” also

implies the possibility of looking “*beyond*” or “*through*”³. This feature is frequently practiced in political life interactions, where looking saves seeing, being focused on something internal overlooked by the speaker, aspects related to publicly inexpressible understandings.

The place of Alberti's painting, as a window for portraying reality, is now taken by language, a window into human nature. Language “*reflects the way we grasp reality, and also the image of ourselves we try to project to others, and the bonds that tie us to them. It is, I hope to convince you, a window into human nature.*” (Pinker, 2007: 11)

The new way of operating postmodernism⁴ allows us to experience the transgression of world limits. The mirror is a metaphor of looking, which allows such exercises.

From the semiotic perspective, the mirror image is not a “real” image, similar to the pictorial image or the media simulacra, but the manifestation of an object effect, a virtual image. The transmitter is also a co-transmitter. Expression and content also coincide, and “the referent of a mirror image is a purely visual matter. The speculated image is not a sign and cannot be used to deceive.” (Eco, 2008: 286)

However, Carroll cancels the focal distance from the object and puts Alice in the mirror. The *sign seeker* (Stoichita, 2013) may be tempted to look for meaning in the founding myths thus describing initiatory experiences, the journey to the world beyond (Culianu, 2007). Language, a symbolic instrument created by man, is constitutively charged with fictional potential. It may mediate journeys to possible worlds, basically exploring its limits.

Similar to the window, the liminal screen illustration, the mirror is a space of thematized experiences of looking⁵.

Alice, journeying through the mirror, “has gained a knowledge of her identity, she can think logically without losing her imagination” (Auden, 1991: 176).

As the liminal illustration of the screen, the mirror, pushes looking to the limits, thematizing the pictorial discourse, so does the mirror push the limits of language in literary discourse, testing its ability to convey meaning. Both have an essential role in the configuration of political discourse.

3. The Subject Position in the Semiotic Act. Between Narcissus and Pygmalion

The interiority-exteriority dichotomy is seen today in Shakespearean terms: to be or not to be (on the screen)? The latter issue, beyond the charm of the drama referent, draws attention to an important aspect. The media discourse, similar to the political one, not only represents means of conveying and presenting reality, capable of providing a real *Imago Mundi* (Frumușani, 1999: 239), that could update social reactions such as those of Andersen's tale, *The Emperor's New Clothes*: “The Emperor is naked!”. Both play an essential part in the social construction of reality. They can both create reality (through pseudo-events) or they may annihilate it. The politician has a single shakespearean choice: to be... on screen!

However, being on screen does not guarantee accurate knowledge of reality, a fact demons-

³ “the other day, at the coffee shop, a lonely teen glared at the room; sometimes his eyes stopped on me; I was then certain he was *looking* at me without being sure whether or not he actually saw me: unthinkable distortion: how to look without seeing?”, Barthes, 2010: 32.

⁴ I understand postmodernism in the sense portrayed by Umberto Eco: “an ideal category, or better still, a *Kunstwollen*, a way of operating. We could say that each period has its own postmodernism, just as any period has its own form of mannerism (in fact, I wonder if postmodernism is not simply the name of *Manierismus* as a meta-historical category.”, 1983: 102-103.

⁵ “To pass to the other side of the mirror means to pass from the designation report to that of expression, without stopping at intermediaries such as manifestation, significance. It means to reach a realm where the language is no longer linked to what it designates, only to what it expresses, so which meaning”, Deleuze, 1991: 188.

trated daily by politicians.

The position of the subject in the semiotic act becomes essential in the construction and establishment of meanings. His perspective is unique, although the experienced share with others are similar. His view is inimitable, it defines identity, and the particular manner of perceiving reality. Bakhtin (1990) introduces the concept of “*law of placement*” in order to explain this phenomenon (Holquist, 1990: 21), which becomes relevant for understanding the identity-alterity relationship, I-Other: “each person is in a unique place for seeing the world as the fundamental condition for understanding” (Holt, 2003: 226).

To understand reality through its representation places the subject in an insurmountable, but fascinating paradox, fully exploited in the media discourse. Postmodern man is somewhere between Narcissus, a victim of *self-interference* (Marcus, 2011: 837) and Pygmalion, a victim of the *simulacrum*, fundamental component of the Western imaginary (Stoichiță, 2011: 281).

Looking is an incomplete tool of knowledge, which requires the intermediation of other senses in order to gain access to the construction of meaning (Stoichiță, 2013: 82-85). It is the reason for which the semiotic construction becomes an operation involving all three operators: looking, talking and understanding.

4. Political Discourse Metaphors

4.1. Imaginary, Metaphor and Political Discourse

The political discourse is a space where reality is redefined through linguistic categories, “as the political language is both a form of describing/illustrating the world and a manner of strategic actions taken within and for the world” (Frumușani, 2012: 146).

Hence, the refining of speaker discursive strategies, used to apprehensively open the *Romanian imaginary dowry*, appears not only as evidence, but also as a necessity in the Romanian public discourse. Especially considering that Romania is, according to some authors, a special case: “This proximity of the Romanian culture and imaginary stems from ancient cultural and historical roots which make Romania, perhaps from all of Europe, the country which retained a unique mythological substrate, not covered, I would say concreted, by a rationalistic culture as seen in Western Europe” (Wunenburger, 2003: 27).

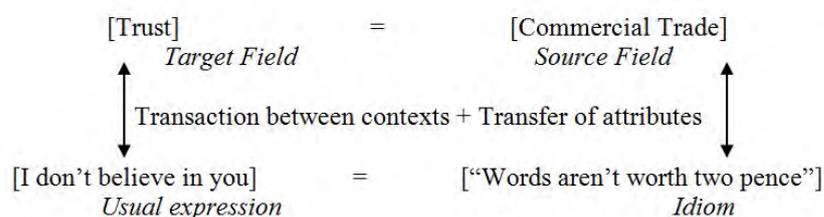

To that effect I’ve observed the dynamics of meanings within the domestic political discourse and metaphoric mechanism, such as possible correspondences in the *rhetoric archive* of our cultural tradition.

Linguistic knowledge is oftentimes either a metaphorical knowledge, a cognition through images (Coșeriu, 2001). The successful use of a metaphor increases the speaker’s authority, who proves capable of subtle associations, of understanding the *community semiotic treasure*, of “thinking with his heart” (Bortun, 2011: 128).

4.2. Coherence between Words and Actions. Political Discourse Issues

By analyzing the discourse sequences which demonstrate this aspect, in the local political discourse, the results implied a certain semantic stability, as well as convergence to the idiom “*Words aren’t worth two pence*”. This is part of the structural metaphor class (the idea of trust is structured in pragmatic, trading terms).

The semiotic code constructing the metaphoric mechanism may be schematized as follows:

The dowry of the Romanian imaginary is rich in idioms concerning the relationship between words and actions. These represent the premises of a “colorful” metaphorical language, called *metaphoric references*: “Beating the wind”, “To carry fire in one hand and water in the other” etc. All these linguistic achievements help us classify metaphors in a certain *cultural pattern* (Iliescu *et al.*, 2008: 26).

The story behind the metaphor is much older. The fundamental theme is the appropriateness of *speaking* and *doing*, a central theme in the theory of language acts.

The relationships established between statements and the world bears nuances in the Judeo-Christian cultural pattern: “What would you prefer? Promise and not deliver or be reserved, but finally adopt the unobtrusiveness of the act? [...] We all often say that he who “cants” bears no credit. But things are different here: it’s better to do things differently than how you said you would do them, if what you say is doubtful” (Pleșu, 2012: 240).

4.3. Forms of Looking Metaphors in the Political Discourse

Looking metaphors can gain profound meanings in the social construction of reality on various levels:

- (i) *cognitive* – “Here’s how I see Romania”, “We must show legislative transparency” etc.
- (ii) *social practice* – “he glanced beyond the walls”, “I’d show the white feather!” etc.
- (iii) *emotional* – “Their eyes met”, “He seems blinded by his own ambition” etc.

Visual experience is integrating, which explains the semantic wealth of looking metaphors (Marcus, 2011: 828).

Analyzing recent political discourse (2013-2014) and applying a process of abstraction for metaphoric constructions of looking, including those involving semantic marks specific to the same (clear, transparency, opacity, vision, blindness, perspective, etc.), one may identify a few looking metaphor *types*. The outcome is similar to that known in the literature (Lakoff & Johnson, 1980, Danesi, 1990, Ortony, 1993 & Coulson, 2006):

- (i) UNDERSTANDING IS SEEING
- (ii) KNOWING IS SEEING
- (iii) THINKING IS SEEING
- (iv) SEEING IS TOUCHING

4.4. Conclusions

(i) To look metaphors as mediators between the imaginary and rationality means freedom in semiotic constructions.

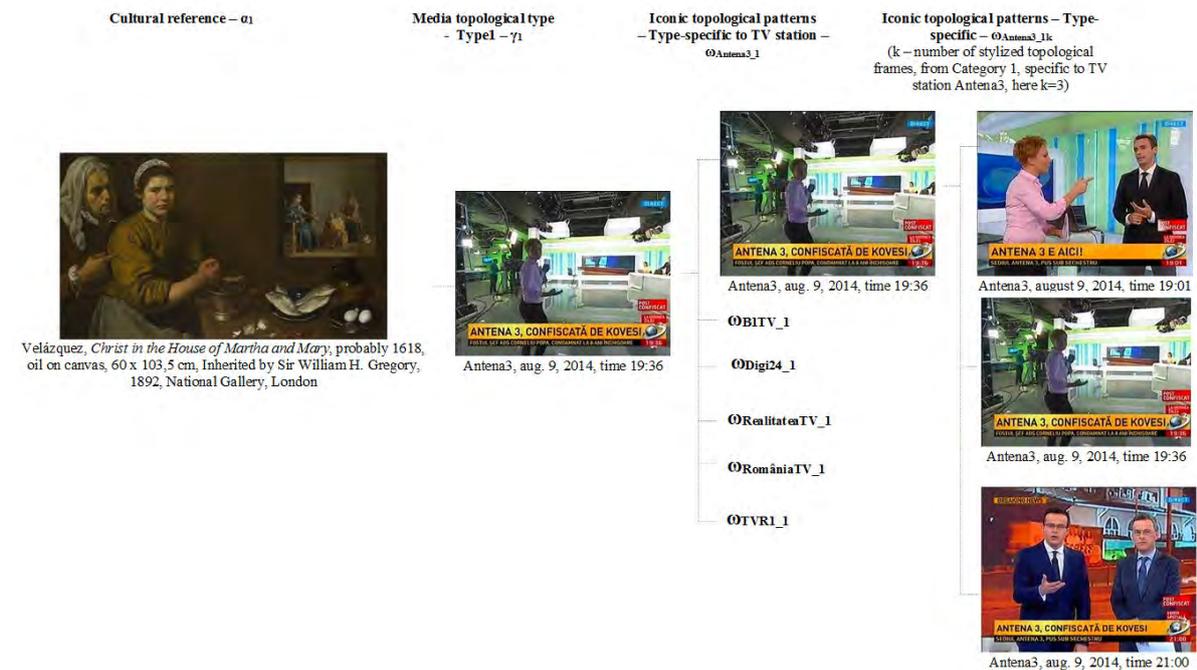

(ii) Metaphoric representations are crucial to the relationship between words and actions.

(iii) The presence of imaginary forms within the political discourse allows the mediation of meanings. The imaginary can provide coherence and consistency, legitimacy and power to the discourse and political actions (Wunenburger, 2005: 117).

(iv) The lack of passion for politicians in terms of rational and argumentative discourse order, the absence thereof from the domestic public sphere metabolism is expressed through the *unusual combination of “European” dynamism and Oriental sensuality* (Pleșu, 2013) overwhelming the Romanian political scene. Thus, the hypothesis according to which the lack of a natural order in discourse rationality can explain the difficulties of adapting to linguistic, social norms etc., specific to the Western world gains plausibility.

(v) This postmodern disarray of Romanian political life seeking for an identity (*Pirandello Effect*) has an alternative in a coherent system of symbolic representations, identifiable in the Romanian imaginary.

Saying a lot with few words represents the formula of expressiveness. For this reason, the paper is a plea for refining the speaker’s discursive strategies, in an attempt to apprehensively open (in a gesture of semiotic common sense) the Romanian imaginary dowry.

THE UPRISING OF SOCIAL VALUES AS A STAKE OF THE 2012 GREEK ELECTIONS CAMPAIGN. FOLLOWERS OF SYRIZA ARE DESIGNING THE NEW POSTERS FOR THEIR PARTY CAMPAIGN

Abstract

Election campaigns became the most suitable spatio-temporal contexts where and when any (possible) President will implicitly or explicitly connect to some powerful mental images, adapted to the social and cultural embeddings. In this paper, we focus on the study of 25 election campaign posters during the 2012 election campaigns in Greece as they had been ordered and produced by particular followers-designers of the left-orientated party of Syriza. In the Greek elections of 2012, Syriza's rise has put pressure on the traditional forces to create a wider coalition and had produced many "alternative" posters. The aim of this piece of research is to illustrate the socio-cultural meaning of these posters: the literature offers three general conceptions of the receivers, as-mass, as-outcome, and as agent. The audience-as-agent conception (poster creators as transcoders of political ideology/ followers-designers) has largely come to dominate our understanding of the engagement between the viewer and text, therefore this model allows

us (the viewers) to move toward the idea that viewer engagement can itself create social value – whether cultural or political. Our research is based on socio-semiotic methodology (Barthes, 1977; Kress, et al 1996; Lagopoulos & Boklund-Lagopoulou, 1992; Randviir & Copley, 2010), which is not confined to a formalistic approach of texts, but scrutinizes them as an integral part of a material, socioeconomic and political context. We apply this methodology in order to determine the messages ideology in relation to the world of left-orientated politics. The analysis led to a series of important data referring to the structuring of the verbal and iconic message of the posters and how this messages and signs are connected with “new forms” of politics, which are reproduced by Party followers. Political posters have the potential for meaning (are signs with appearance, information and targets), but that meaning probably, cannot be directly transmitted from any designer to the gaze of voters. It can only be mediated through the voters’ social context, which lies outside the designer’s control. This semiotic mechanism, in which followers-designers and voters are connected through posters, is where socio-cultural value being more realized.

1. Introduction – Theoretical background

The main exponents of politics and at the same time official bodies of ideology are the political parties, the so-called ‘parties of power’ within and outside Parliament. Mass communications comprise institutions and techniques by which specialized groups use communication tools to disseminate symbolic messages in a crowded and heterogeneous audience (Janowitz 1988). Under a sociological perspective, mass communication has the character of a social relationship in which a big amount of people and groups takes part. Thus, political advertising, arranges to feed the masses with social standards, which ensure systemic balance, especially in an election campaign period.

Therefore, the mechanisms of mass culture use various methods of influencing by means of indirect, diffuse and internalized coercions, thereby introducing the so-called symbolic violence, as Antonio Gramsci had designated, *a cultural hegemony* (Petras & Veltmeyer 2001), which is no other than the dominant culture (Gramsci 1971; Eagleton 1991; Manheim 1985; Althusser 1984). According to Baudrillard, the mass media are not simple coefficients but modulators of the dominant ideology, through which promote definitions of reality which completely invalidate critical thinking – crafting, in fact, a fake reality (Hall 1980) and giving the receiver the feeling that the thought of the transmitter is his own thinking, confirmed by a third party (Downing 1980).

Posters were used as a tool both in politic actions and war, but with certain limits, which made them acceptable because of the situation. The end of the First World War and the various political upheavals in Russia and elsewhere, were two important factors that influenced the direction of political posters for something new, not commercial. This thing didn’t satisfy both governments and poster creators. Until 1950’s, the idea of political posters was a “medium of advertising persuasion” or an “artistic” medium of advertising (Barnicoat 1972).

The poster is a prime form of ideological speech; it is a creation of advertising – being integrated into mass communication. Used largely by advertising because its visual-scenic status enables it to transmit polysemy and high density signals mainly through its virtual function. As a carrier of meanings, it produces ideology allowing intervention codes inherent in society. At the same time, it uses images, concepts, ideas, beliefs, myths, etc. available in the mainstream culture. The poster, in other words, is not merely a reflection of the dominant ideology; but a process that we could argue, which is one of the most typical examples of “myth” in a Barthesian sense. Barthes (1979) describes the myth as a particular semiotic system, derived from a first semiological chain which existed before myth. The myth namely is a second semiotic system. So,

political campaigns are the most suitable for projecting social or other values and also ideology of each party. As well as, it derives a question which Andreas Ventsel puts (2014: 175-192) on how to visualize hegemonic relationship in photography, as photography is a strong instrument on which power relations are established (in our case in political posters).

In Greece, there are 7 major political parties that are elected in the Parliament after the latest elections of 2012 (New Democracy – Syriza¹ – Pasok – Golden Dawn – Independent Greeks – Dimar – KKE). Syriza is the major opposition party, led by Alexis Tsipras (40 years old) and elected 71 MP's. In the Greek elections of 2012, Syriza's rise has put pressure on the traditional forces to create a wider coalition and had produced many "alternative" posters. Election campaigns became the most suitable spatio-temporal contexts where and when any (possible) President will implicitly or explicitly connect to some powerful mental images, adapted to the social and cultural embeddings.

In this political and ideological context we focus on the study of 24 election campaign posters during the 2012 election campaigns in Greece as they had been ordered and produced by followers of the left-orientated party of Syriza. The aim of this piece of research is to illustrate the social meaning of these posters. The key question is how people make signs in the context of interpersonal and institutional power relations to achieve specific aims.

Political posters have the potential for meaning (i.e. are signs with appearance, information and targets), but that meaning cannot be directly transmitted from the designer to the gaze of voters. It can only be mediated through the voters' social context, which lies outside the designer's control. Our researching question refers to this context where social value is realized. Obviously, the definition of values is difficult to be given while value is that man believes he deserves in life. It would be, in other words, an illusion to give a definition for the term value, since the boundaries of terms are socially defined and we understand that vary depending on the 'filter' we use to analyse them (ideological, cultural, economic, scientific, philosophical, etc.).

What a person or a culture considers as a value, for others it is demerit. The general use of the term in social sciences implies any object of any need, attitude or desire. The interest of sociologists did not focus on the validity and relevance of the scientific importance of values, but regardless of their definition, they considered values as 'empirical variables' within social life. For social scientists, the scientific importance of values was not related to whether the values are true or false, valid or not, but to explore the use of the term by the people in a society where those who profess to believe them as true and correct. So, social values are ideas and beliefs of the majority of members of a society for the desirable and undesirable, the just and the unjust, the good and the bad, the beautiful and the ugly (Christodoulou 2013).

Studying ideology brings semiotics in an interdisciplinary contact with philosophy and the social sciences. U. Eco describes ideologies as codes that are present in the messages with a number of associations (Nöth 1995: 377–378). Ideology operates primarily at the level of associations, often by unconscious meanings, which have texts or practices. In this sense, ideology resembles a hegemonic attempt to restrict certain associations to establish new and to generate new connotations, according to Barthes. Texts, as ideological forms, often carry a 'latent consciousness', a hidden ideology, as they present the world with a particular image (Storey 1993: 2–6).

As mentioned before, the analysis in this paper focuses on posters of SYRIZA, having in common, paradigmatic axis of social values. In fact, the discussion of the analysis of the term social values in an exemplary axis means that there is a debate opposite meanings, but the visual comparison of different producers of posters. This means that ideology (party) and its lin-

¹ *Synaspismos Rizospastikis Aristeras*, Coalition of the radical left.

guistic realization reflect one another, so that each partisan statement arises primarily 'social', namely a reflection of society and not just a disciplined manipulation of significance (Iedema 1995:22–36). The term social value appears as a concept to deal with an ideological agreement – in this case the selected posters. The choices at the level of words or codes will likely support or disprove the above terms based on the analysis.

The question that arises in the context of an analysis is *why the analysis is done*. The answer to this question relates to the reminder that the texts selected for analysis did not differ ideologically, culturally, socio-economically and politically, by a clear framework within which it is embedded, namely, 'bear', values and ideas, because of the fact that are produced for a particular party in an election campaign. It is known that language is not "socially innocent", while words have a second memory and are lined with associative loadings. Language carries numerous information and ideological messages (Barthes 1971). Texts namely are studied as cultural texts in their current socio-political context (Iedema 1995).

2. Analysis

The analysis of twenty four (24) posters is based on a linguistic content analysis in the context of structural semantics to reveal apparent mechanisms of the production of meaning (Barthes 1977; Greimas 2005², Kress et al 1996; Lagopoulos & Boklund-Lagopoulou 1992; Randviir & Copley 2010). The analysis is not confined to a formalistic approach of texts, but scrutinizes them as an integral part of a material, with socioeconomic and political context.

Structural semantics is a method of analyzing not only natural languages but every semiotic system. Principal of structural semantics is that the basic semantic structures and the elements of a culture permeate all the semiotic systems of this culture. It assumes that the basic structures of the text are 'hidden'. The aim of the structural semantics is to identify the main structures of significance of the text and to make clear their internal relationship. Basic concept of structural semantics is the isotope, namely all units ratio (references) according to their semantic content (semantic code).

The analysis revealed 15 semantic codes, covering the semantic content of the responses to the level of detail of interest, that is, reports concerning to values or demerits in an individual and social level. These are the following semantic codes: reversal, resistance, of values, arise, national, leisure, electoral, political, historical, temporal, monumental, traffic, people, humorous, literary.

Taking advantage of the specificity of this campaign – which was designed by ordinary members of the party and not by an advertising company- we seek the non-linguistic communication of left ideology and how it is represented in visual material. The visual semiotic perspective in our case discloses that it is a social research process, thus we proceed from "language" to the "semiotic" mode. By this point of view, new forms and modes of communication are revealed and integrated through political posters and representations. We apply this methodology in order to determine the messages ideology in relation to the world of left-orientated politics.

The question that arises: how a form of expression, which in this case is the poster, we arrive to a form of co-emphasis is ideology? By which way the literal level is building the prime associative level of ideology (signifiers-rhetorical/ideological signifieds). How is this made virtually?

In a poster analysis we can focus into two main axes, (a) to the poster itself (production) and (b) how people receive the message (consumption). In our research we focus in the production of the posters (figure 1).

² As it was used by Lagopoulos and Boklund-Lagopoulou (1992), Boklund-Lagopoulou (1980), Christodoulou (2003, 2007, 2014).

Fig. 1

Every poster is constructed by the same way, in tree zones: (α) The non-verbal message/ Iconogramm, (β) A steady message in three parts. For example: *They decided without us/We are moving without them, Overturn in Greece/ Message to EU*, (c) Syriza’s brand name (figure 2).

Fig. 2

The method of analysis of the 24 posters followed structurally the same mode as shown in Table 1 below. On the left the poster and on the right information about (a) the linguistic message, (b) the virtual message (persons and objects) and (c) the dominant codes of the language and virtual message, respectively (see table 1).

Poster	Verbal	Iconic		Codes
		Persons	Objects	
	we are crossing the most critical period before democracy (<i>ironic message</i>)	three political persons from (Pasok ³ , ND, IMF) wearing army uniforms	Phoenix (junta symbol)	<ul style="list-style-type: none"> Political (army/junta) Historic

Table 1: Example of Analysis.

From the analysis of the posters we have fifteen (15) codes that are involved in the interpretive process for the production of meaning without defining the concepts of text, but they tend to limit their function as communicative conventions (Chandler, 1994). The results shown that from the total twenty four (24) posters, fifteen (15) of them have linguistic messages (62%). The linguistic message concerns on the following codes:

a) Code of Values: *health, peace, solidarity, dignity, freedom, education, culture, justice, democracy, popular power, resistance*

b) Political Code: *for real democracy and popular power, vote to the left, the attached us memorandum, loans, debts, bipartisanship sets – Greece rises, golden dawn.*

³ PASOK – Panhellenic Socialistic Movement, ND – New Democracy, IMF – International Monetary Fund.

c) Resistance code: *resistance, disobedience, we can overthrow them, to deport them, we are moving on, we have the power in our hands, go away.*

d) Literary Code: *poetry.*

e) Code of Waking up: *attention, danger, death, think, no.*

f) Humorous: *Bennito, Karatzaphurrer, you will bite again?*

g) Saluting: *goodbye, Like (facebook).*

h) Temporal: *6-5-2012, time is over.*

i) Electoral: *Here we present "solutions", through them Syriza.*

We observe that, regarding to the linguistic message on the posters, it works either auxiliary or supplementary to the operation of the "anchor" and "broadcast" of the linguistic message (Barthes 1988). By the process of anchoring, the linguistic message helps on choosing the right perceptual level, in other words attracts the gaze and the perception of the receiver on the projected image of the shapes and the messages which make use (Kress 2010). The anchorage offers us a declaration or otherwise a meta-language for certain parts of the virtual message.

Persons appear in eight (8) posters (33,3%) and are:

a) Six (6) persons with a red star heart

b) a young man.

c) three persons/politicians with military outfit (members of other parties).

d) three persons with suits and hoods.

e) the devil in blue and green background.

f) crowd.

g) the Monopoly guy.

h) German soldiers.

We observe that persons belong to politics, to religion (devil), to history (Germans), to economy and leisure games (Monopoly) and to society in general (youth, crowd). Concerning the objects, which in their majority are symbolic, they are correlated with the following codes:

a) Political: party flag, Phoenix (junta), red signs of left turns, clepsydra (blue-green), party symbols, nazi flags, *Greece.*

b) Social: jail cells.

c) Resistance: two fists on a red background (compound), punch, two fists in blue and green background (dec), Trotskyist fist.

d) Electoral: voting envelope, lobby hat (capitalism), ballot, election records.

Miscellaneous items: crook, hook, TV, lightning, backgammon, blue and green dice, nails resulting from blue and green holes, money, citadel, a theater, feet.

3. Results/Discussion

From the above analysis of 24 posters, as carriers of values of SYRIZA, raises a number of general conclusions. These findings relate to the achievement of this objective, ie, how the political ideology of the left party SYRIZA is structured. Posters, as articulated semantic sets which are 'carrying' an ideological load, were analyzed on their structural elements based on the theory of A. Greimas, i.e. codes.

The analysis led to a series of important data referring to the structuring of the verbal and iconic message of the posters and how these messages and signs are connected with "new forms" of politics, which are reproduced by Syriza Party followers. Although semiotics can analyze systems of meanings, cannot go further without interdisciplinary collaborations. It is well known that in every social and financial crisis, international community is focused firstly on education. Semiotic analysis of political posters (and not only) can contribute in citizenship education, giving deconstruction tools to citizens – pupils to raise their political awareness and also it can be

useful to citizens in order to understand the difference between ideology and propaganda.

Posters are hinged so as to be read in a particular way – reading, which hides messages. The analysis, showed to us that the structure of meanings of posters is made by a relation between two poles: “Us” Vs “Them”. This is the semiotic mechanism of meanings. Regarding the semantic charge of the “US”, we observe that they are correlated with codes as: values, democracy, popular power, resistance, history and literature. In regard to “THEM”, we observe that producers select to represent the *others* as demerits. E.g. skulls, troika bombs, devils, memoranda. So, the relationship between these two poles of “we” and “they”, shows the possible “overthrow” through our participation in elections by voting in order to give a strong signal to Europe.

GRAMSCI'S PRISION NOTEBOOKS: A SEMIOTIC APPROACH TO CULTURE?

Pietro Restaneo
Sapienza University of Rome, Italy
pietro.restaneo@gmail.com

Abstract

The present paper will discuss the relationship between culture and language in Gramsci's *Prision Notebooks*. The aim will be to determine whether Gramsci's approach to the topic of culture can be defined as "semiotic". To guide us through the discussion, and to better understand the meaning of a "semiotic approach to culture", we will take as a reference the theory of Yuri Lotman, whose methodological and conceptual framework we will compare to Gramsci's reflections on language and culture not only to determine whether Gramsci's approach to culture could be defined "semiotic" (in Lotman's sense), but also to better understand his use of the word "culture", and its complex, dynamic relationship with language.

1. A semiotic approach

The aim of this paper is to discuss the relationship between culture and language in Gramsci's *Prision Notebooks*, through a critical comparison with Lotman's cultural semiotics and to determine whether it is possible to speak of a "semiotic approach to culture" in Gramsci. Given the vastity and complexity of Gramsci's meditations, in this paper, for simplicity's sake, we will take into consideration only two of the four poles that, according to T. De Mauro, within the *Notebooks* the author considers as the main, different aspects of individual and collective experience: "(1) the economic-productive element pole; (2) [...] the cultural pole; (3) the pole of politics [called elsewhere 'the operative pole'], and; (4) the linguistic and communicative pole" (De Mauro 2010: 258).

For the sake of the analysis, also, our definition of a "semiotic approach to culture", among the many possible, will be tailored around the specific conception of semiotics of culture in Yuri M. Lotman.

Lotman's cultural semiotics see culture as "hierarchy of semiotic systems" (languages), struc-

turally isomorphic to each other and constant interaction (Salupere, Torop and Kull 2013: 71).

The main function of culture is the production of new meanings, which is achieved through an act of translation of material from the ‘outside’ in a language of the ‘inside’. An act of translation is therefore also a creative act: new texts and meanings are produced, and external reality is reshaped and organised. We could go as far as to describe culture as a mechanism of creative “*smysloporozhdenie*” [meaning-generation] (Lotman 2010: 640).

The meaning-generation function can be carried out by culture only within specific conditions: new meanings can be produced only through the dialogue (translation) between two non-identical, or asymmetric, structures. Therefore one of the fundamental characteristics of culture is its “*vnutrennej neravnomernost*” [internal irregularity] (Lotman 1984: 11); this also implies that no system of signs (language), or text, could exist in isolation, since it immediately implies other languages, through which can sustain its meaning-generation function: “the ensemble of semiotic formations precedes (not heuristically but functionally) the singular isolated language and becomes a condition for the existence of the latter” (Lotman 1984: 19).

Finally we can define the “cultural semiotic approach” (in Lotman’s sense) as an approach: (1) that regards culture as a hierarchically organised sign system; (2) whose object is “the functional correlation of different sign systems” (Torop 2009: xxvii); (3) and whose “fundamental problem” is the “meaning generation” (Lotman 2010: 640).

2. Culture

Throughout the *Prison Notebooks*, the term “culture” is employed in a very wide array of contexts, with different meanings. Sometimes it is employed as ‘intellectual activity’, sometimes as ‘conception of the world’, sometimes as ‘intellectual, spiritual and aesthetic development of a certain individual or nation’. As the anthropologist Kate Crehan points out, “given these complex and sometimes contradictory clusters of meaning, it is important to resist the temptation to fix on one of them as the ‘correct’ one. [...] It is precisely this complex argument that is at the heart of Gramsci’s explorations of culture” (Crehan 2002: 41–42).

Culture intended as “conception of the world” can be explicit and critical, in which case Gramsci defines it as a “philosophy”; or it can be unconscious and incoherent, in which case the author refers to it as “*senso comune*” [common sense]: “*ogni strato sociale ha il suo «senso comune» che è in fondo la concezione della vita e la morale più diffusa. Ogni corrente filosofica lascia una sedimentazione di «senso comune»*” [every social layer has his own “common sense”, which is, in the end, the most widespread moral and conception of life. Every philosophy leaves a sedimentation of common sense] (Q1 §65)¹. “*Il senso comune è un aggregato incomposto di concezioni filosofiche*” [common sense is a fragmented aggregate of philosophical conceptions] (Q8 §173).

The deep connection between language and culture is explicitly stated by Gramsci in many passages of his *Notebooks*: “*ogni linguaggio contiene gli elementi di una concezione del mondo e di una cultura*” [every language contains elements of a conception of the world and of a culture] (Q11 §12), “*linguaggio significa anche cultura e filosofia (sia pure nel grado di senso comune)*” [language also means culture and philosophy (be it at the level of common sense)] (Q10 §44).

3. Language

Save for a few exceptions (see for example Rosiello 1970), the theme of language in Gramsci was often overlooked by traditional Gramscian studies. In last three decades, instead, the importance of author’s linguistics studies, and their influence on his theory of hegemony, has been extensively acknowledged, and a vast bibliography has been produced on this topic².

Gramsci studied linguistics in Turin, under professor Bartoli, a prominent member of the

so-called neolinguistic school. In one of his letters to Tania (Gramsci 1971: 19th March 1927), Gramsci confesses that one of his deepest regrets was to have disappointed his master (Bartoli), who saw in him “the arch-angel destined to annihilate the Neogrammarians once and for all”. Neolinguistics was in fact created to oppose the Neogrammarian School, the dominant trend in linguistics at the time.

The Neogrammarian School was movement in linguistics that sought to explain language only by means of natural laws and physiological mechanism, therefore excluding social factors and semantics. Bartoli and the Neolinguistics (deeply influenced by authors such as M. Bréal and G. I. Ascoli), in Gramsci's words, *della linguistica, concepita grettamente come scienza naturale, ha fatto una scienza storica, le cui radici sono da cercare «nello spazio e nel tempo»* [made of linguistics, narrow-mindedly conceived as a natural science, an historical science, whose roots are to be found in «space and time»] (Q3 §74).

It's already clear, and should become clearer on a closer inspection, that Gramsci's notion of language seems to anticipate in many ways the structuralist movement (e.g. Rosiello 1970, Ives 2004a), despite the fact that he had no knowledge of Saussure's theories, as far as we know.

Gramsci distinguishes between *linguaggio*, language, and *lingua*, a specific historical language (e.g. German, English, etc.). Language, for Gramsci, is not a “single thing [...], neither in time nor space”, but rather a “collective term (*nome collettivo*), [...] a multiplicity of facts more or less organically coherent and coordinated” (*Pare si possa dire che «linguaggio» è essenzialmente un nome collettivo, [...] una molteplicità di fatti più o meno organicamente coerenti e coordinati*). (Q10 §44).

To better understand what the author means by “collective term”, we can refer to another passage of the *Notebooks*, where Gramsci analyses an article by Italian writer Leo Ferrero. In the article, the author refers to the “*ammirazione*” (*admiration*) of the public as the main factor for the flourishing of a national literature. Gramsci points out that Ferrero is oversimplifying, and the term “*ammirazione*” is “*una metafora e un «nome collettivo» per indicare il complesso sistema di rapporti*” [a metaphor and a collective term to indicate a complex system of relations] (Q21 §4). If we were to generalise, we could say that language, being a collective term as well, is also a ‘complex system of relations’.

In the *Notebooks* Gramsci constantly refers to different specific languages, e.g. to the “French military language” (Q26 §11), the “language of German classical philosophy” (Q11 §48), or the “language of physics” (Q10b §11). The reason, and also the relation between *linguaggio* and *lingua*, is clearly explained by Gramsci himself:

ogni corrente culturale crea un suo linguaggio, cioè partecipa allo sviluppo generale di una determinata lingua nazionale, introducendo termini nuovi, arricchendo di contenuto nuovo termini già in uso, creando metafore, servendosi di nomi storici per facilitare la comprensione e il giudizio su determinate situazioni attuali ecc. ecc.

[every cultural trend creates his own language (*linguaggio*), that takes part in the general development of a specific language (*lingua*), introducing new terms, enriching it with new contents terms already in use, creating metaphors, using historical names to ease the understanding and the judgement on specific contemporary situations, etc. etc.] (Q24 §3).

The passage should be understood bearing in mind the particular notion that Gramsci has of the term “metaphor”, which he intends not (or not only) as a rhetorical device but as a “*mutazione semantica*” [semantic shift] (Q11 §24): “*quando da una concezione si passa ad un'altra,*

il linguaggio precedente rimane, ma viene usato metaforicamente. Tutto il linguaggio è diventato una metafora e la storia della semantica è anche un aspetto della storia della cultura [when from a conception [of the world] we move to another, the previous language remains, but is used metaphorically. All the language has become a metaphor, and history of semantics is also an aspect of history of culture] (Q4 §17).

A conception of the world therefore determines the meanings of our language, so that “ogni lingua è una concezione del mondo integrale, e non solo un vestito che faccia indifferentemente da forma a ogni contenuto” [each language (*lingua*) is a whole conception of the world, not only a dress which can indifferently form any content] (Q5 §123). This last passage shows how, for Gramsci, *linguaggio* as well as *lingua* are not mere instruments, tools to be freely applied; every philosophy, every culture, “every intellectual activity” needs his own language to “manifest” itself (Q11 §12), and through this language becomes able influence the common sense by shaping the language (*lingua*) of a nation.

In this way the authors seems to be establishing a sort of privileged relation between the cultural pole and the linguistic and communicative pole.

4. A cultural semiotic approach?

Despite the author never openly defining it as such, culture as well could be regarded as a “collective term”, a “complex system of relations”, more than a stable and defined concept.

It is not possible to conclude that in the *Notebooks* culture is considered as system of signs, at least not in the sense of Lotman’s cultural semiotics. Nevertheless, Gramsci puts the problem of the generation of meaning at the core of it’s investigation, going as far as subsuming the study of semantics under the study of culture, as one of it’s aspects. This could be regarded as the first, strong analogy between Gramsci’s and Lotman’s theories of culture.

The analogies also are not limited to the aim of the study, but further extend to it’s methodology: in the *Notebooks* the study of culture concerns mainly the functional correlation of different sign systems, i.e. the different languages (*linguaggi*), that comprise it. The study of literary texts, theater, folklore, newspaper magazines, etc. as expressions of a certain cultural system (with all it’s contradictions and heterogeneity) is one of the main foci of Gramsci’s investigation. Seven out of sixteen main research tasks that he sets to himself at the beginning of the first notebook, are dedicate to language and literature, including a study on “*romanzi d’appendice*” (or “*Feuilleton*”, popular, mass oriented serial novels, published on newspapers), a typology of “*riviste di divulgazione*” [mass educational journals] and on folklore (Q1, §*Note e appunti*). The author also sets on investigating the “implicit conception of the world of Pirandello’s dramas”, and his influence on popular culture (see for example Q5 §40, Q6 §26, Q9 §134).

A similar methodology is followed by Lotman’s cultural semiotics: “from a researcher point of view it is more correct to speak of culture as a mechanism generating an ensemble of texts, and of text as the realisation of a culture” (Lotman and Uspenskij 1971: 152). The text is the “fundamental concept of modern semiotics” (Salupere, Torop and Kull 2013: 57), and it is always considered “as the realisation of some system, as its material embodiment [*voploshhenie*]” (Lotman 1970: 67). This entails that the semiotic study of culture is always *applied* to some texts, which are studied through the relation with the culture they are expression of. For example, the study on the *Slovo o polku Igoreve* in the light of the opposition between “*chest*” [honour] and “*slava*” [glory] in Slavic medieval culture (Lotman 1967b), or the study of Dante’s *Divine Comedy* in the light of the medieval conception of space (Lotman 1990: 177–184).

5. Translation

In many paragraphs of his *Notebooks* Gramsci seems to sketch the dynamics of meaning generation in a manner very similar to Lotman’s cultural semiotics.

According G. I. Ascoli, an Italian linguist who had a deep influence on the Neolinguistic School, the main device of linguistic (and semantic) change, rather than laws internal to each language, is the reciprocal influence among different languages. Employing a biological analogy, linguistic change through internal laws could be defined as a parthenogenic process, while Ascoli's description could be described as a non-parthenogenic process.

Gramsci retains Ascoli's explanation, and expands it to his own cultural and political theory (Ives 2004a: 55). Cultural change seems to be treated as an act of translation³ between different levels of cultural space: from philosophy to common sense, from common sense to philosophy, and from one philosophy to the other.

It has been argued that Gramsci's notion of "translation" has a double meaning: one one hand it is close to the modern concept of (linguistic) translation, one which "aims at changing both the languages involved, both the source language and the target language" (Ives 2004a: 133); on the other hand, it could be seen as a "metaphor for non-parthenogenic processes" (Ives 2004b: 99).

In the former, linguistic, meaning, "translation" for Gramsci does not mean a mechanical conversion of the signifiers of one language in those of another language (Q1 §152). Since each language is the expression of a culture, each act of translation implies a dialogue between two cultures, and two semantic histories, hence a process of reciprocal acquisition and reframing.

In the latter case, translation would be responsible for the creation of new philosophies or conceptions of the world, as for example the philosophy of praxis would be the result of the translation of the concept of "immanence", offered by classical German philosophy, into historicist form, through French politics and classical English economy (Q10 §9).

Another consequence of translation in the latter sense would be the possibility of reciprocal influence between the different aspects of human experience (culture/language, politics and economy), through the reciprocal translation of their own languages (Q11 §65), making it the main device for their development.

In both cases, we can observe an analogy between Gramsci's and Lotman's approaches to culture. In the works of both Lotman and Gramsci the text is considered to be the expression of a certain language, therefore translating a text means to try to translate said language, and the whole conception of the world it is a manifestation of, into one's own. Moreover, an isolated text could be used in the attempt to reconstruct the language it originated in ("reconstructing the semiotic whole through its parts") (Lotman 2005: 215). In this sense, for both authors text and culture have not only the function of meaning generation, but also serve as the structural memory of a whole culture: "*il linguaggio è una cosa vivente e nello stesso tempo è un museo di fossili della vita passata*" [language is a living thing, and at the same time it is a museum, full of fossils of the life past.] (Q4 §17) It is interesting to note that the metaphor of the "museum" is also employed by Lotman in his description of the semiosphere (Lotman 2005: 213).

Even more interesting is the common conception, between the two authors, of a "non-parthenogenic" mode of cultural development. The reasons for this similarity, in our opinion, connects to their philosophical and epistemological background, and especially to the epistemological fundamentals of Marxism and Hegelianism, which they both shared: "the fundamental principle of structuralism is dialectic" (Lotman 1967a: 93); and especially in Marxist dialectic, "the main engine of history was contradiction [*protivorechie*]" (Gasparov 1996).

6. Structure and superstructure

As we said in the premise, in this paper we will avoid to discuss about the political and economic-productive poles, and focus only on the cultural and the linguistic aspects of Gramsci's research.

Despite this, we feel necessary, as the final part of this paper, to briefly mention the relation

between the cultural and the economic-productive aspects of experience in Gramsci, and the possibility to find analogies, or strong differences, with Lotman.

The relationship between the cultural and the economical or, in marxist terminology, between superstructure and structure, is one of the most complex and debated topics of the whole *Notebooks*. It pertains mostly the epistemological position of “*filosofia della praxis*” (philosophy of praxis, the way Gramsci called marxism), which for the author is one of the most critical points of his enquiry (Q4 §38).

Some authors argue that in this respect Gramsci would fall in the trap of the so-called “naturalist prejudice”, where the economy, or what he calls “*condizioni [oggettive] di vita*” ([objective conditions of life] Q10 §48), is seen “as a homogeneous space unified by necessary laws” (Laclau and Moffe 2001: 89). If such were the case, the cultural and linguistic poles of life (as well as the political one) would be determined by the economic-productive pole; any semiotic activity would have its origin in a non-semiotic space, and a “semiotic approach” would have its foundation on a non-semiotic science, i.e. economy, and could be ultimately reduced to it. We argue that this is not the case for Gramsci. The notion of class in the *Notebooks* certainly has its foundation in the “economic” pole, but economy, as well as philosophy and politics, are all elements of a conception of the world (Q4 §46), and they do not belong to different realms. Even if Gramsci admits that economy, the “material element”, is “the less variable element of social development”, susceptible to quantitative measuring, it is still regarded as a “human relation”, socially and historically (and culturally) organised, as is the science that studies it (Q4 §25). Therefore, even if it’s debatable whether in Gramsci culture is the foundation of economics, we think that the opposite is definitely not the case, and that economic laws are not different, in their nature, to the so-called “social laws”.

In this sense we could make an analogy with the notion of “reality” in Lotman: what we call “reality” is an already semiotised world (Lotman 1993: 30), since for man nothing exists which was not translated in one of its languages.

7. Conclusions

Insofar as Gramsci did not possess the modern, and ultimately Saussurean, notion of “sign”, the approach to culture and language in the *Notebooks* can be regarded, in our opinion, as “semiotic”, and as such bears strong resemblance with Lotman’s approach.

The attribution to Gramsci of the term “semiotic”, as it was for the term “structuralism”, is certainly anachronistic, but in our opinion appropriate. In this regard, we would like to quote a passage from Luigi Rosiello:

Queste intuizioni gramsciane, che possono apparire precorritrici delle moderne tesi strutturalistiche e istituzionalistiche, non devono però far pensare a meravigliose capacità intuitive di intelligenza preveggenze; esse sono né più né meno lo sviluppo coerente dei presupposti oggettivistici di una considerazione sociologica dei fatti linguistici.

[Those gramscian intuitions, which might appear as forerunners of the modern structuralist and institutionalist theses, should not lead to think of some wonderful intuitive capacities of foreseeing intelligence; they are none other than the coherent development of the objectivist premises of a sociological consideration of linguistic facts] (Rosiello 1970: 358).

In our opinion this entails the possibility for that branch of semiotics called “political semiotics” to go back to the study of Gramsci, seen as a fundamental author whose reflection on power and culture from a semiotic point of view could offer an effective conceptual framework.

Notes

1. In the present paper all the quotes from Gramsci's *Prison Notebooks* are author's translations from the critical edition by the Gramsci Institute (Gramsci 1975), and will use the standard reference notation, where Q# is the notebook and §# is the paragraph number (e.g. Q1 §12 means twelfth paragraph of the first notebook).

2. The first influential work Gramsci's linguistics is definitely (Lo Piparo 1979). A very important English-speaking scholar in Gramscian linguistics is Peter Ives (e.g. Ives 2004a); for a collection of essays in English on Gramsci and language by international scholars see (Ives and Lacorte 2010).

3. For an overview on the concept of "translation" in Gramsci, see Part III of (Ives and R. Lacorte 2010).

SEMIOTICS APPLIED TO MARKETING COMMUNICATION

ADVERTISING TOOLS AND TECHNIQUES APPROPRIATED TO CONSTRUCT THE GLOBAL BRAND MR. CLEAN

Carl W. Jones

“Advertising is the greatest art form of the 20th century.”
Marshall McLuhan. Ad.age. Sep. 3, 1976.

Abstract

As a knowledge worker for over twenty-five years in the advertising system, I created branded communications on behalf of corporations. Using my marketing experience coupled with research into techniques and methods appropriated by the advertising industry I will demonstrate how the creators of brand messaging use advertising tools & techniques to express branded concepts.

In this paper I will examine how and why brand meaning is constructed and shared through the appropriation of advertising tools and techniques in contemporary messaging. First, I will define the concept of “brand”, and its significance. Here, I intend to measure significance in light of the capitalist system (in which it is regulated) characteristic elements. Then I will describe semiotic theory to demonstrate how it can be applied to branded advertising messages. After presenting a history of the *Proctor and Gamble* manufactured *Mr. Clean* brand, I will expound the tools and techniques applied to create this global commodity, and how these delivery systems provide the product brand meaning, through signs broadcast to consumers by way of: logos, packaging and advertising messages transmitted through mass media. Thus leading to an increase of sales, that is integral for corporations to grow within the capitalist system.

1. Introduction

As a knowledge worker for over twenty-five years in the advertising system, I created branded communications on behalf of corporations. Using my marketing experience coupled with research into techniques and methods appropriated by the advertising industry I will demonstrate

how the creators of brand messaging use advertising tools & techniques to express branded concepts.

In this paper I will examine how and why brand meaning is constructed and shared through the appropriation of advertising tools and techniques in contemporary messaging. First, I will define the concept of “brand”, and its significance. Here, I intend to measure significance in light of the capitalist system (in which it is regulated) characteristic elements. Then I will describe semiotic theory to demonstrate how it can be applied to branded advertising messages. After presenting a history of the *Proctor and Gamble* manufactured *Mr. Clean* brand, I will expound the tools and techniques applied to create this global commodity, and how these delivery systems provide the product brand meaning, through signs broadcast to consumers by way of: logos, packaging and advertising messages transmitted through mass media. Thus leading to an increase of sales, that is integral for corporations to grow within the capitalist system.

1.1 The brand

In their 1988 dictionary of marketing terms the American Marketing Association (AMA) defined the concept of a brand “a name, term, sign, symbol, design or some combination of these elements, intended to identify the goods and services of one seller or group of sellers to differentiate them from those of competitors”(Bennett, 1988). Contemporaneously a *brand* is seen as more than just an identity system. A brand can also be a complex system of interrelated management decisions and consumer reactions that create awareness, visibility and meaning of a commodity product. The process of branding may include the look of the packaging, the typeface of the package and advertising, packaging and advertising design concept and language, as well as the content and form of the product itself.

Brands are effectively created and used by way of the application of various theories in the creation of a symbol or trademark to represent the brand and its brand personality to the consumer. Some theories appropriated in the creation of a brand logo or wordmark are Carl Dare’s seven contrasts of type; colour theory, and visual hierarchy. A technique applied after the wordmark is created is the creation of a brand character. Where a personality is developed for the brand by appropriating human characteristics, so that the consumer will consider the brand as a friend with whom they trust. The personality is expressed by the following tools: wordmark, logo, advertising and shopper marketing. So that, every time the consumer comes in contact with the brand through any media or environment, the personality of the brand will be experienced. These *brand marketing* techniques are practiced in the developed, and developing world, assisting corporations in capturing consumers through the narrative of storytelling. Expressing a story around a brand is a tool used in advertising in order to build consumer allegiance, leading to the customer constantly purchasing a specific brand. This marketing trend repeats the deeply rooted need of all humans to be entertained (Lury, 2004). Later on in this paper I will define and expand on the role of the narrative as an advertising tool, using Greimas’ actantial model.

Brands are measured in sales and in earning potential. A chart is created by global consultancy corporation *Interbrand*, who publish every year a brand’s perceived value. In 2013 Apple was the most world’s valuable brand, with a value of \$98,316 m, and Pampers owned by Proctor & Gamble was in 29th place, this same company owns the household multipurpose cleaner: Mr. Clean (*Interbrand*). This perceived brand value is created through advertising tools and techniques such as: brand character, textuality, logo, typography, slogans, mnemonic devices, narratives, and can be analyzed using semiotic theory.

1.2 Semiotics

Semiotician Umberto Eco states that “semiotics is concerned with everything that can be taken as a sign” (Eco, 1979, p.7) and also suggests that signs are everywhere, and they consist of: slogans, typography, body language, clothes, images, colour etc.

Semiotics is an important area of study, and its theories can be applied to communication. With many media channels broadcasting over 5,000 messages a day to the typical urban consumer (Walker-Smith), the studies and observations of theorist Roland Barthes are very important when applied to messaging that is broadcast through mass media. As discussed in his book *Mythologies*, Barthes’ application of *signifier + signified = sign* to advertising can bring insights into symbolic messaging applied to global brands such as Marlborough and Coca Cola. Barthes demonstrates how these are instrumental in exporting capitalism to non-western nation states through globalization (Barthes, 1972, p.115).

Furthermore Marcel Danesi explains that a sign can consist of symbols, words, images and “the word sign is used in semiotics to encompass anything that stands for something other than itself” (Danesi, 2013, p.590). Danesi, a Professor of Semiotics at the University of Toronto is a leading semiotician believes that “brands are one of the most important modes of communication in the modern media environment” (Danesi, 2006, p.3). I will be applying both Barthes’ and Danesi’s semiotic observations to the advertising tools and techniques applied to the brand Mr. Clean.

1.3 History of Mr. Clean

As depicted in the AMC television cable show *MAD MEN*, the 1950’s and 1960’s were known as the golden age of advertising. Corporations had been performing an “aggressive use of research and development in the postwar period to devise new and often quite useful consumer products; and the advent of television, which the advertising industry latched onto as a powerful mass-marketing Tool” (Schnakenberg, 2000, p.2).

In 1958 the American consumer product giant, Procter & Gamble - known as P&G – decided to enter a growing “all purpose cleaner market” infusing the market with it’s own version, by first approaching a medium-sized Chicago based advertising agency: Tatham-Laird. The shop’s creative director, Tom Cadden, was asked to come up with a brand name and a song, known in the advertising business as a *jingle*. These are typical tools used by advertising agencies to create messages for mass media in the 1950’s and 60’s. In 1958 P&G launched “the product—and the character—(that) were unveiled to American consumers as Mr. Clean”. This brand name and advertising were designed to appeal to the target market of “married women who did not work outside the home” as it was discovered in research that “most husbands at the time rarely performed household chores” (Schnakenberg, 2000).

Richard Schnakenberg who wrote about Mr. Clean in the *Encyclopaedia of Major Marketing Campaigns*, observed that towards the end of the 1990s the Mr. Clean brand was used by “8.5 million households in the United States alone” and was distributed in 18 nation states. The brand character was recognized by other brand names where sold around the world; Mr. Propre (Germany, Austria, Switzerland, France, and Belgium); Maestro Lindo (Italy and Greece); Maestro Limpio (Mexico); Don Limpio (Spain and Portugal); and M. Net (French speaking Canada).

2. Tools & techniques

I will now define the tools & techniques that were appropriated by advertisers to give meaning to the brand Mr. Clean. This branded commodity is available in various cultures, and has one brand meaning expressed through different linguistic and visual signs. The advertising tools applied to semiotic theory are: Brand name, Brand character, Typography, Logo, Textuality, and the techniques are; Illustration, Mnemonic devices, Narratives, and Hero.

2.1. Advertising tools

Brand name.

In order for a brand to be marketed, a symbol or trademark is created to represent the uniqueness of the commodity product to the consumer, so that it is differentiated from other similar products. Once a brand has a self-identity expressed through its packaging, tools and techniques from the advertising industry are applied. This is to give meaning to individual branded commodities distributed within the capitalist system. The brand meaning is expressed through the agency of contemporary messaging that is broadcast by way of mass media, to reach a specific target market. So that every time the targeted consumer comes in contact with the brand through any media or environment, the personality of the brand will be experienced, through messaging created and produced through advertising and design agencies.

During the 1950's research was performed on American housewives by P&G for the creation of an all-purpose household cleanser, and it was decided to position the household cleaner "as the perfect helper for harried homemakers." To project this strategy it was decided to construct a linguistic solution by creating a name for the product, so the advertising agency studied mid century popular culture and noticed the widespread "Mister" trend. In the 1950s it was commonly used to personify a distinct attribute; "Milton Berle was known to be 'Mr. Television'"; Stan Musial was "Mr. Baseball"; and Senator Robert Taft was "Mr. Republican." So it followed that the master of household cleaning should be "Mr. Clean" (Schnakenberg, 2000, p.3). Brand naming is a strategy "designed to convey conceptual images associated with products through a suggestive name" (Danesi 2013, p.82). Therefore the prefix *Mr.* evokes images of: male, power, respect, safe and status. The word *clean* evokes the concepts: hygienic, tidy, pure, unsullied, the colour white. Therefore the name Mr. Clean conveys the linguistic signs of: male, power, status, respect, safe, pure, hygienic, and the colour white.

2.2. Brand Character.

Once the household-cleaning product acquired a brand name, the linguistic solution to an advertising problem has to be interpreted into a visual sign, in order to link the brand name with the products attributes of "power and strength" (Schnakenberg, 2000, p.4), and give a meaning to the brand name that cannot be misinterpreted by the consumer. Leading advertising practitioner, Rita Clifton describes in her book *Brands and Branding* that a brand character is a "visual symbol that has artistic quality while representing a clear commercial articulation of business strategy" (Clifton, 2003, p.119).

It was decided between Proctor & Gamble and Tatham-Laird to "create an association in consumers' minds between Mr. Clean and power and strength, the agency chose to depict him as a versatile muscle man" (Schnakenberg, 2000, p.4). It is very important in advertising to create a brand character for a product that is unique from its competition, and we use visual devices because "people can picture faces and images much more accurately and quickly than they can recall words" (Danesi, 2006, p.82). In the case of Mr. Clean the agency created an image of a brawny male and "the early drawings were loosely based on actor Yul Brynner and the genie character Djinn from 'Aladdin's Lamp' " (Schnakenberg 2000, p.4). Yul Brynner was one of the most public figures during the mid 1950's who had performed in *The King and I* on Broadway and won a Tony award, and then an Oscar in 1957 for reprising the same role in the filmed version (fig 1). Russian-born, American-based film and stage actor of Eurasian background, he was considered attractive, with his shaved head, that created a memorable image (Capua). He was in his mid-thirties while on performing on Broadway In *The king and I* and in the film version, Yul Brynner wore a ring in his left ear. This symbol was associated with genies that appeared in American culture and projected a magical exoticism, which was non-threatening to an Ameri-

can public. The 1940 British film *The thief of Baghdad* has a genie who grants wishes, and in the 1945 film *A thousand and One nights* a genie comes out of the bottle and helps win love.

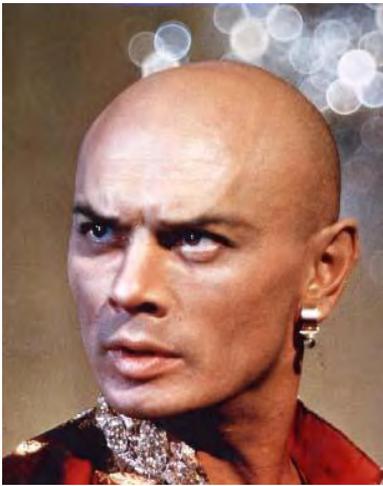

Figure 1.

Figure 2.

Brynner had a muscular body in *The King and I*, and this attribute was appropriated in the visual construction of the pictorial representation of the Mr. Clean Character. This was demonstrated through the hyper maleness that appeared on DC and Marvel comic superhero characters as demonstrated through emphasis on thick neck and large muscular arms. The fact that biceps are used to move the cleaning product around the surface to be cleaned, would demonstrate power in the act of cleaning, or, that Mr. Clean performed a lot of cleaning. Therefore displaying Mr. Clean with muscular arms (fig 2) would emphasize the product benefit to the viewer, and accomplish what the agency wanted of having the brand character perceived as an “all-time cleaning champ” a cleaning superhero for American house wives.

The agency then researched clothing, and explored a white garment that “represented an ex-sailor” (Schankenber, 2000, p.4). It was perceived in US popular culture, that a sailor travels the world and visits many different ports. America had recently finished WWII and the imagery of the navy was seen in popular culture in *South Pacific*, both on Broadway in 1949, and on film during 1957 (IMB), also women were wearing sailor inspired clothing on the streets (Vintage). The United States media broadcast that it had won in its war against parts of Asia in WWII, bringing democracy to this troubled region. Mr. Clean represented the mixture of America and the exotic, which created a tension that made the character interesting to housewives.

The ad agency had to decide how to use clothing to emphasize the concept of power through the brand character. A long sleeved, white shirt would cover the muscular arms that conveyed strength, while a short, white t-shirt would enhance the strong arms, and still reflect the sign of the sailor that they were exploring during this design process. The colour white reflects purity and will display any speck of dirt on its surface, therefore if the t-shirt is white it has no dirt and is pure and hygienic. The visual device of a brawny male dressed in white clothing helped re-enforce the brand name Mr. Clean, who was a respectable male, strong, pure, hygienic, and presented the products attributes of power and strength to the targeted housewife.

As finally rendered, “Mr. Clean was a strapping bald man with slightly Asiatic features and a large hoop earring in his left ear” (Schankenber, 2000, p.4). When the product was launched, the advertising down played the sailor story, and in research conducted after the launch, the consumer interpreted the visual brand character (fig 3) as “some sort of genie” (Schankenber, 2000, p.4) without mentioning the sailor sign.

Fig 3. TV commercial late 1950's. USA.

2.3. Typography

After a product has a brand name, and the brand character is visualized through a visual device, the next tool used by advertisers is Typography, to assist the brand name in projecting an image that the consumer will not confuse with another. The same effort placed into creating the brand image will now go into creating the Mr. Clean logotype, which is formed through; typeface selection; the arrangement of the letters M R C L E A N; and then applying two of Carl Dair's (2012) theories; contrast of size; and contrast of colour.

Fig 4.

Brides love Mr. Clean

because he's the next best thing to a full-time maid. Procter and Gamble's new all-purpose liquid cleaner is the all-time champ at all kinds of cleaning!

Fig 5.

The font selected in the original packaging (see fig 4) for the words Mr. Clean is a *Sans Serif* meaning without serifs in English. A serif is a short line that is added to the main strokes of typefaces. This style of typeface used on the packaging is called *Franklin Gothic Extra Condensed*, and was a very popular font in the 1950's. Its lack of serifs creates a clean line around the font, it appears uncomplicated without any thick or thin strokes. The typeface would have appeared very contemporary in the 1950's, which re-enforces the launch of a new product that was the lat-

est in home cleaning technology. Selecting a font that is not associated to another brand is very important, so that the brand name can have its own unique visual appeal. Applying Dair's theory "Contrast of size", one can notice how all of the letters on *MR. CLEAN* packaging are upper case, and the first letters M and C are slightly larger than R. L E A N, and they're also "letter spaced" apart. The size difference re-enforces the hierarchy that the word CLEAN is more important than MR, and the first letters of each word have slightly more power than the rest. The largest letter is C, which "creates a focal point around which it is easy to organize the subordinate material" (Dair, 2012, p.55).

With Dair's "Contrast of colour" (Dair, 2012, p.69-73), the letters are coloured in the warm spectrum that visually "move towards" the consumer, bringing the brand name directly at the consumers eye, and the "use of a second colour for contrast" which is yellow on the Mr. Clean packaging, complements the red lettering making it the main focal point on the package. The typography together with the red colour on a yellow background for the Mr. Clean brand is called a wordmark, which is a logo without a pictorial image.

2.4. Logo

For the last 100 years, marketing departments aim to give a branded product a meaning through the creation of visual and linguistic signs. It's difficult to create a personality for a brand if it doesn't have a name or logo. The Marketing division's objective has always been "to get people to react to brands in ways that parallel how people respond to art and religious symbolism" (Danesi, 2006, p.60).

This can be accomplished through wordmarks and logos, which are "visual signs steeped in symbolism" (Danesi, 2006, p.54) and can be defined as "true symbols in the semiotic sense – signs standing for referents in culturally specific and historically meaningful ways" (Kress, 1996).

The wordmark of Mr. Clean is combined with the visual device of a bald, muscular, male character created for the brand, producing a logo that can be interpreted as a sign. Applying Barthes' theory of "signifier + signified = sign" (Barthes, 1972, p.115) to this logo, can bring insights into the symbolic messaging. Therefore: Mr. Clean (signifier) + power (signified) = Mr. Clean is power (sign), and this is part of the strategic messaging that P&G wanted to transmit to the consumer.

The logo can also be considered a mini "text". In semiotic terms the phrase text is the "putting together of signifying elements (words, sounds, images etc.) to produce a meaningful message" (Danesi, 1972, p.69). The text created in the Mr. Clean logo reflects the brand positioning of all-purpose cleaner that is the housewife's perfect helper because of its power and strength. This is reflected through the combination of: typography; colour; male; shaven head; muscular arms; white shirt; and the addition of a golden earring that brings in the tension of American/exotic.

2.5. Textuality

As defined by Danesi in his book *Brands* "signification systems... are established through brand names and logos... constitute the 'referential system' upon which advertisers create ad texts to display them in various media (print, radio, television etc.). The form they are given in advertising campaigns can be called their 'textuality'" (Danesi, 2006, p.70). I will now focus on how textuality was created for Mr. Clean in a 1958 TV commercial created the year the commodity was launched in the United States. (TV 1958).

The black and white TV ad opens with the words Mr. Clean written in dirt, which is removed to reveal the muscular, brand character, who is wiping the screen clean. Followed by images of soiled appliances and areas around a house, that are transformed "*clean*" by the animated char-

acter of Mr. Clean. The textuality of the commercial presents a white, muscular, male, removing all dirt, helping the housewife, whose face transmits the emotion of awe. The verbal part of the texts lists all of the surfaces he can clean including; walls, doors, windows, and kitchen appliances, which are demonstrated; six times in 60 seconds. The phrase “clean” is repeated verbally twenty times in 60 seconds. The housewife follows the brand character around the house, and by cleaning a mirror, he makes her beautiful reflection appear, inferring that by using Mr. Clean a housewife will be as beautiful as her clean home. (TV 1958) The cleanliness reflected through the verbal and non-verbal signs manufactures a tangible impression in the viewer’s consciousness, producing “indirect stimulation of a sensation (which) is known as ‘synesthesia’ ” (Danesi, 2006, p.71). “Synesthetic textuality” allows viewers to participate in the commercial as it stimulates neurological feelings to what they are seeing presented in the advertising. Semiotician Barthes in his 1977 book *Image-Music-Text* mentions that since synesthetic textuality permits viewers to become a “voyeur,” it arouses the senses by watching. It also transmits emotions through sensations that the brand activates in the brain in a believable manner (Barthes, 1977). The synthetic textuality of eliminating dirt with power, is turned into love as the housewife observes the muscular bald male annihilating grime, and stands enamoured next to him in the 1958 TV spot. Also Love is the outcome presented in the film *The King and I* starring Yul Bryner, where the female schoolteacher falls in love with the powerful, bald, king, who is fighting for his country.

3. Advertising techniques

I will now expand on the interpretations of the following advertising techniques applied to ‘signs’ presented in the Mr. Clean messaging, broadcast through the mass media.

3.1 Illustration

After the Mr. Clean Logo had been conceptualized in 1957, the ad agency, Tatham-Laird’s art director had to decide how the brand character would be expressed as a visual device. There are many options available to an agency art director, who is responsible for the visual imagery that appears on packaging and advertising. In the case of Mr. Clean, the muscles, eyebrows, neck, and facial emotional state, can be manipulated to reproduce and broadcast the message in a clear undistorted form. This also allows for freedom in placing Mr. Clean in a variety of positions and situations, such as holding a happy baby (fig 6). Cameras and babies are a difficult match for an advertising photo shoot that cost thousands of dollars, and by illustrating the situation, the art director is guaranteed the results. The agency hired artist Richard Black to interpret the character in the technique of realistic illustration. Reproducing the brand character to appear on low-resolution analogue television, was solved by creating a simplified version of Black’s illustration style. This translated version consisted of a heavy black outline of the body, and a thinner black line presenting the facial characteristics such as the smile, eyes and eyebrows of a 38-year-old man (fig 3).

The illustration technique also allowed for layered images where the brand character can be expressed as non-threatening to the target market, by being placed with babies or wearing feminine articles. (Fig 5, 6)

Fig 6. 1958 print ad.

Fig 7. 2012 US logo.

The basic illustration style has been kept since Mr. Clean's launch, and updated for today's consumer, however the basic elements of the highlight on the right side of the face, earring on left, white t-shirt, bushy eyebrows have been consistent over the last 57 years (fig 7). The highlight on the left hand side of the face emphasises brightness caused by the brand's cleaning power. The artist who illustrated the original Mr. Clean, Richard Black, died April 1st 2014 in Ohio (Black).

3.2 Mnemonic devices

In the advertising field mnemonic devices are intended to assist the memory in remembering a brand and its benefits. They are part of an ad's textuality, and are composed of verbal and non-verbal devices that can appear in any mass medium (Danesi, 2006, p.75). In Mr. Clean there are a number of devices the brand has appropriated and called its own, so that when the consumer is put in contact with these mnemonic signs, they will think of Mr. Clean. The brand's verbal and non-verbal devices are: baldhead, muscular man, colour white, folded arms, lyrics, jingle, wordmark, and gleaming star.

The Yul Brynner reference became a mnemonic device for the household cleaner, after he became less popular with the general public. The only time the public would see a baldhead was when Mr. Clean was broadcast through mass media. During the 1970's and 80's mass media created icons such as Kojak, or Mr. T that have entered the public consciousness, but faded from public view after their popularity waned. However constant reminders through branded advertising messaging Mr. Clean has stayed top of mind. As it became fashionable among males in the 90's to shave their heads, the public associated it first with Mr. Clean. This I know, as I have shaved my head since the early 1990's and have heard references, numerous times.

During the 1958 launch TV commercial, (TV 1958) every time an appliance was wiped or touched by the brand character Mr. Clean, a white star would gleam, this device appeared to represent cleanliness to the consumer. By having the star appear on everything Mr. Clean touches, emphasising that the product is a multipurpose cleaner, and works on any surface. Then towards the end of the commercial the stars appear by themselves, leaving the viewer to assume that Mr. Clean had been there. The viewer is being visually educated on their journey through the TV commercial. This non-verbal device was used to bring attention to the appliance's surface, and was accented by a verbal device comprised of one high note, "ting" as if played on the musical instrument called a triangle. It would sound every time a star appeared, signifying clean.

A jingle consists of words and music, that when put together create a mnemonic device, and “put the brand into words” (Danesi, 2006, p.75). The jingle in the commercial is a verbal device, and is part of the verbal strategy of *Mr. Clean*. Procter & Gamble’s, advertising agency, creative director, “Tom Cadden, was charged with coming up with ... a jingle to sell the product” (Schnakenberg 2). The lyrics he wrote for the song that appeared on television and radio are: “Mr. Clean gets rid of dirt and grime and grease in just a minute / Mr. Clean will clean your whole house / And everything that’s in it. / Floors, doors, walls, halls / White sidewall tires and old golf balls / Sinks, stoves, bathtubs he’ll do / He’ll even help clean laundry too!” This was repeated twice during the 60-second ad that ended with “Mr. Clean, Mr. Clean, Mr. Clean” (TV 1958).

The writer used what Danesi calls *poetic devices* to create a memorable slogan in the form of a jingle. This technique is used so that it can “increase the likelihood that the brand will be remembered” through the fact that it conveys the message through “rhyme, rhythm, and repetition” (Danesi, 2006, p.78-79). The rhyme is created by the lyrics; “minute,” “in it,” “halls,” “balls,” “he’ll do,” “laundry too.” The rhythm is reflected by the music that accompanies the song and the songs written structure, the word “clean” is repeated 20 times in 60 seconds. The lyrics also establish an enemy for Mr. Clean to eliminate: dirt and grime, this is mentioned twice.

Together, the verbal and non-verbal devices, created a memorable commercial, that assisted in Mr. Clean’s successful launch “In the first nine months after its introduction, 35 million bottles of the all-purpose liquid detergent were sold. The product soon became the top selling all-purpose cleaner in the United States” (Schnakenberg, 2000, p.5).

3.3. Narratives

As the brand character of Mr. Clean evolved over 57 years, the narratives created around his need to eliminate grime had to advance in order to contribute to the brand’s longevity. Mr. Clean’s story is expressed through advertising transmitted by way of mass and digital media. In his book *The Quest for Semiotic Meaning 2007* Danesi defines a narrative as a “story that is put together to portray reality in a specific way. It is a representation of human events as they are perceived to be related to the passage of time [...] It is often difficult [...] to determine the boundary line between narrative fact and fiction” (p88).

Algerian born, French structuralist, Algirdas Greimas 1917-1992 contributed greatly to the study of semiotics by writing about the narrative, and he also created the actantial model. The model is based on Propp’s theories (1968) and can be applied theoretically to analyze stories or narratives by breaking it down into six components called actants, and these components make up Greiman’s Actantial model (Hebert, 2006). Greiman explored how narratives are constructed, and provided their structural skeleton into components or actants.

Mr. Clean although a hero, requires additional context. Stories imagined by viewers may complicate unnecessarily the hero. To organize this the message creators made their own narrative and provided it to the viewers through the medium of television. Moving image through the medium of television has been used consistently for Mr. Clean since its launch in the mid 1950’s to present day. In October 2013 Procter and Gamble released a 30 and a 60 second commercial in the United States titled *Mr. Clean, Origin*, which explains the genesis of the brand character. For this analysis I will focus on the 60-second version. (Fig 8-TV 2013)

Fig 8. TV 2013. 60 sec Mr. Clean Origin. 3D animation.

The colour, 3D animated, television commercial, explains the life history and purpose of Mr. Clean, from when he was a small child to present day. The viewer is taken on a journey, which I will breakdown in a simplified way, using the Greiman's actantial model (Danesi, 2007, p.108): (1) The subject: Mr. Clean (2) desires: cleanliness (3) he encounters the opponent: dirt and grime, while the (4) receiver: consumer (targeted viewer, consumers family), benefits from Mr. Clean's desire (5) the consumer, by using the household cleaner Mr. Clean, helps to accomplish the *cleansing* action, while (6) the opponent; dirt and grime, attempt to hinder his cleaning. Actants are "the same ones found in ancient myths" and according to Danesi "Myths constitute 'metaphysical knowledge texts' for explaining human origins and actions" (Danesi, 2007, p.108). Greiman was able to deconstruct narratives from various cultures and time periods, and discovered a common structure. This theory was appropriated to create the myth of Mr. Clean as explained in the 2013 TV spot, and the conflict between cleanliness and dirt was first set up in the first TV commercial that aired in 1958. This myth has been the basis of P&G's message to Mr. Clean's target market for nearly 60 years and shows no signs of failing, as global sales are up.

3.4. Hero

Hero theory, as written by Thomas Carlyle appropriated the concept of *Visuality* to create and justify the hero, and this is done to maintain power over the population, and maintain the status quo (Mirzoeff, 2006). Carlyle's concept of creating a hero by appropriating visuality, has been a technique used by advertisers for many years. Either the consumer is turned into a hero by buying a product, as is the case with iPhones, be the envy of your friends, or the actual product is a hero that the consumer wants to be part of, such as Harry Potter merchandise.

The visual device of Mr. Clean is quite unique in the product category of household cleansers, where the consumer uses a particular household product, and becomes a hero in their families/friends eyes. In the case of Mr. Clean, the product is the actual hero with the consumer admiring or even loving him.

One technique used to create the hero in the advertising is seen in fig 3, in one of the first Mr. Clean TV commercials. The brand character stands, in a pose, as if he is a statue, and is admired by the housewife looking up at him. In Fig 9, it is 57 years later, and the camera angle is lower, looking up at Mr. Clean, he is presented as heroic, standing with his hands on his hips, in a pose

reminiscent of the work of Nazi propaganda filmmaker *Leni Riefenstahl* in the film *Triumph of Will*. The technique of low camera angles and statuesque poses of the subject has been appropriated in popular culture to create a noble subject and appears on album covers, comics and graffiti art. American superheroes such as Superman are drawn from a low camera angle, after they have completed a successful action, and Mr Clean is presented in this way at the end of the 2013 commercial (Fig 9).

Fig 9. TV 2013. End Frame. 60 sec Mr. Clean Origin. 3D animation. USA.

In his book *Mythologies*, Roland Barthes explains the concept of connotative and denotative, where myth occurs when the consumer reads connotative meanings as denotative. This concept applied to the Mr. Clean visual device as seen in the two television commercials in fig 3 and fig 9, produces the following connotative meaning in the consumer: that the household cleaner named Mr. Clean is actually a male hero, a superhero. What this signifies is that a plastic bottle, filled with yellow liquid, is actually a male human, who is also a hero. This meaning is socially and culturally specific and not a natural association.

As I have argued and demonstrated in this paper, when advertising tools and techniques are applied to a consumer product, brand meaning is constructed, and can also be deconstructed by applying this method.

4. Conclusion

The result of the "super hero-izing" of Mr. Clean, who battles the enemy of dirt & grime raised the status of the *housewife*. In the 1950's, American society was being reconstructed after the great depression and 2 world wars, the creation of a middle class, that in some cases couldn't afford maid service, forced the new role of housewife to take on the cleaning. She was being judged in the new classless society being watched by her neighbours, friends, and family. The housewife became the observed. McCarthyism was everywhere, even in the home. The responsibility of the mother was to provide a good home for the family, above all cleanliness. In order to accomplish that, an enemy was created out of dirt and grime. American culture thrives on enemies: good vs. evil, black vs. white, dirty vs. clean. A myth was created about *being dirty*, grime was *un-American*.

It wasn't good enough to be clean, it had to be a clean that shined. Cleanliness meant, sterile, clean mind, pro-America. Housewives were shamed into cleanliness. Not any type of cleanliness, but the cleanliness only obtained with the assistance of a new American male superhero that came in a plastic bottle called Mr. Clean. The battle was fought in the home, where we don't

see actual death, what we see are the positive results from using the brand. A white male superhero who raised the status of a housewife in the eyes of everyone who was watching her.

Since 1958 the western world has evolved, and so has Mr. Clean. Recently P&G updated his brand image by demonstrating Mr. Clean helping males clean (TV 2013), however this reboot was not soon enough. The European parliament voted in September 2008 to warn companies who use “sexual stereotyping” in advertising. American blogger and newspaper columnist Albert Mohler (2008) reported, “The (European) Parliamentary report argued that Mr. Clean, whose image dates from the 1950s, is an example of sexual stereotyping. Mr. Clean’s “muscular physique,” The [New York] Times reports, “might imply that only a strong man is powerful enough to tackle dirt” (Mohler 2008) (Carvajal 2008). This action by the parliament signifies that the brand has not been updated sufficiently for contemporary European ideology, and in my mind this warning creates questions regarding advertising messaging, should a white male be considered a hero by coming to the housewife’s rescue? If Mr. Clean was a person of African descent, what signs would be appropriated to create their story, and would they be connotatively interpreted as a hero? Is it correct for corporations to use Hero theory to promote commodity products that give corporations power through money, or should the hero only be kept for governmental/political use? Is it demeaning the concept of the hero -- as created in the bible and 18th century -- when it is reduced to marketing techniques to sell a commodity?

By applying advertising tools and techniques to analysis brands, we can observe the how and why brand meaning is constructed. These observations and learnings can then be applied to other forms of communication to deliver information to advance society, they do not only have to be applied to brands and corporations to sell products. I ask: Can doctors take learnings from advertising messaging construction to change behaviors in patients? Can advertising tools and techniques be applied to the Ebola crisis in order to deliver the correct information to the populace in a format that will not be rejected?

It is very easy to be negative about marketing by focusing on manipulation. We need to understand how advertising is created by its practitioners, and apply this knowledge to advance communication methods to benefit humankind. This method of breaking down successful branding through the analysis of the advertising tools and techniques, gives us the how’s and why of creating meaning. These learning’s and observations can then be applied to un-branded communications in areas where advertising methods are not even considered.

For example the Colombian government appropriated advertising tools & techniques to convince the guerillas to put down their weapons and come home for Christmas. The government went into the jungle and placed trip wires, that when activated, lit up a Christmas tree, with a message that said, “put down your weapons and come home to your family this Christmas” (Operation Christmas, 2011). I ask, can war be stopped through the application of advertising tools & techniques?

Also this paper raises doubts regarding my actions of merging advertising practise, and academic studies: should the practise of advertising learn from semiotic analysis? Is it worthwhile providing creative practitioners with various theories, to justify their design decisions?

Only time will tell.

SEMIOTICS AND QUALITATIVE RESEARCH: THE CASE OF FOOD TRENDS

Giacomo Festi
Nuova Accademia di Belle Arti, Milano, Italy
giacomo.festi@gmail.com

Abstract

Being in the position of both teaching Semiotics and doing research inside the academic domain and working as a consultant for an agency of communication (see Festi 2012), I would like to show how the internal development of the semiotic discipline, in term of methodology and concepts, could enhance the contribution of semiotics in the qualitative marketing research. As a case of study I will present the frame of a huge research about food trends, aimed at constituting a big platform, mapping the transformations in the food domain that could be used with different brands as a ground of reflection for marketing strategic planning.

Instead of being the first to detect new possible trends inside the social life, the semiotician could help, on the contrary, to better interpret the different dimensions involved inside an already recognized trend, in order to display the potentiality of the trend itself. A food trend, actually, can be referred to single figures (in the hjelmslevian meaning) like colors (in 2009, the purple foods were trendy...), to ingredients (for instance the trend of aloe), to specific dishes, to technologies of preparation of food (accessible sous-vide machines), to strategies of consumption or even to national cuisines (just to quote some of the most common topics in food trends). The different “aboutness” of the trend call for more interpretation about not only the values involved, but mainly the forms of connections among the different levels of organization of meaning (following the Fontanille model, 2008).

Presenting this general frame for the trend analysis, I will also question the dynamic of transformation of some trend, like the food trucks in US or the sharing of food photos at the place of consumption.

This contribution aims finally to show how to pass from a trend, as reconfigured in a semiotic modeling, to a brand strategy, in term of managing of identity dynamics.

1. Introduction

Keeping together academic research and consultant activity in the field of communication, it could lead to explore the consequences of the elaboration of a semiotics of cultures and identities for marketing practices. The expression “semiotics of cultures and identities” has to be referred here to the development in Italy and mainly in France of a semiotic approach that try to dialogue with traditionally sociological and anthropological questions, namely with the problem of characterizing meanings inside practices. One major reference is the book *Pratiques sémiotiques* by Jacques Fontanille (2008), where the author sketches a whole project of research layering different semiotics-objects (from signs, to text, objects, practices, strategies and forms of life) inside the complex dynamics of the social dimension, also articulating the forms of interaction (as a rhetoric functioning) among the multiple levels. This contribution can be accompanied by many other authors, for the purposes of this research being relevant the work of Pierluigi Basso Fossali. In Basso Fossali (2009, ch. 8), particularly, a seminal theoretical reflection about trends is present, which is the main topic of our discourse, as applied to the food domain. We are actually going to show a way to approach the quite traditional marketing topic of the trend from a specific semiotic perspective, moving through three different steps: first of all, we will look at the ways trends are becoming part of a public widespread discourse, characterizing three different regimes of discourse of the trend. Secondly, we will display the three major models of interpretation of trends, also proposing a semiotic insight. Finally, we will discuss more in depth an example of trend analysis, opening a comparative dimension involving different social phenomena and discussing the role of the semiotic sight.

2. Three discursive regimes for the trend

The topic of the trend is not only a relevant concept for marketing, since it fully became part of a public discourse, in this metasemiotic activities of human groups that constantly monitor and interpret themselves. We could say that trends are forms of re-valorization of something since they are granting a differential power. Being trendy means having chance to be perceived, since not so many share the trend yet. When something passes from being trendy to being mainstream, the high diffusion coexists with a low intensity in the perception of this social form, i.e. no one will notice it. We are just suggesting a semantic tensive background to introduce us to the topic of trend¹. First of all, however, we would like to characterize three different ways, three regimes of discourse of the trend, three ways of presence of this concept inside the social life, in this nearly foucaultian survey. The first regime is the one identified by the daily newspapers, where the trends are generally anchored to a specific social phenomenon, explicitly tagged as “trendy”. Typically, the trend is characterized as an attractor of interest in a reflexive interpretation of the social. After the presentation of the phenomenon, there is not the necessity to build an interpretative frame of it, but some suggestions can eventually appear. I had occasion to work on a corpus of news articles about different trends, trying to discover the common aspects of the discourses. To sum up, we can find a phenomenological attestation of the trend, with a narrative counterpart since the trend needs to be made perceptible for the reader. The power of the figurative dimension, supporting the narrative one, is exactly offering a perceivable access to the trend. What follows, is the discussion about the eventual process of diffusion of the trend and finally some elements of interpretation can or not be present, in this quite canonical syntactic organization. The world of journalism, then, amplifies something that someone else already qualified or

¹ For a tensive schema representing different positions in a coherent semantic space, confronting the “trendy” with the usual and the *demodé*, see again Basso Fossali (2009, ch. 8).

labeled as trendy, supposing a kind of iconisation or stabilization of the phenomenon, at least sufficient to transform it into something that can become a news. It is worth to point out again that trends are already part of the reflexive dimension of the culture, they witness a cognitive need that is also nourishing a passion for monitoring. Post-modern societies are strongly cultivating this kind of passion². Once a trend appears, we need some reason about its plausibility and its potentiality to be individually assumed. The journalism is interested in following these movements of continuous variation inside the social, especially in their inedited or innovative character. Nevertheless, in daily journalism, the trend is not interpreted in the frame of a wider system of relationships, which is not the aim of that kind of discourse.

Beyond the newspaper, we find a second regime of discourse, the one witnessed by the specialized press about food, on paper or, especially, on the web, that starts to treat in a slightly different way the tendencies. The widespread attention about food made grow what is now a kind of ritual appointment, a sort of multimedia genre: at the end of each year, a competition in publishing the food trends for the year incoming is largely present, with long lists of expected or already attested tendencies. Is the web that is mainly devoted to this exercise, since websites can display also a lot of images inside a gallery, as evidences of the presented trend. Websites like Epicurious, Foodlovers, but also the food section of The Huffington Post or The Guardian witness the growing number of virtual spaces making place to food social dynamics. We move in this case from the single and isolated phenomenon, to a plurality of social transformations. In these lists, there are two point that is worth to underline: from one side, the phenomena that can be qualified as trendy are very different, what means that there is a semantic heterogeneity in their constitution. Adopting the aforementioned Fontanille model, proposing different layers of immanence, we move from simple *signs*, like a color that can become the topic of the trend (in 2011, it was the moment of the purple food for instance³), to ingredients (their materiality makes relevant the level of immanence of the *object*), to specific dishes (to be read as *texts*, since they display a grammar of combinations), to *practices* of consumption, to specific cuisines (more directly readable in term of *form of life* that are present inside the approach of that cuisine), etc. The “what is trendy”, in a trend, is attributed to configurations that are very distant one from the other. On another side, what is the trendy aspect in the trend, what is justifying the trend movement, remains an open question, calling for further interpretation. If you take a very simple example, the trend of the food trucks that exploded in US in the last years of the last decade⁴, it is not immediately evident which aspects were trendy. To quote some of the features that has been read as trendy, we move from the mobile consumption, to the use of social media like Twitter to find out where was parking your preferred truck; or we switch from the kind of new fusion cuisines that started to be proposed, to the kind of new consumption on the go. As a consequence, what is trendy in a trend has clearly to be interpreted.

Coming back to these lists, sometimes the accumulations of social phenomena are so precise and articulated that – we could argue – are doing concurrency to the communication agencies or research institutes, that social actors that represent the third regime of discourse. It has to be added that they are also part of a social public world, since, often, some section of their researches about trends can be presented or published, online or offline, making these lasts become more visible and not just hiding them as invisible tools for marketing practices.

In the case of qualitative research, the attempt to treat the multiplicity of the trends detected with an homogeneous methodology, creating some forms of structuration of the materials, is

² See again Basso Fossali (2009, ch. 8) for a discussion about the passion of monitoring.

³ See Martens (2010).

⁴ See for instance Chang (2009).

what specifies this further regime. The point here is the integration of the identity pole: under the diversity of the manifestations of trends, at some point they participate to the redefinition of the social identities. In that way, inside the marketing research, a methodological and epistemological jump can be noticed: trends thematize identities or lifestyles. A second typical operation made by the most interesting approaches consists in abstracting, from actual trends, some system of relationships (involving values) that could be generalized, in order to project that patterns into other domains, what explains the immediate strategic valence of this option. Such a way to work is exemplar in the approach of the Italian FutureLab, ruled by the sociologist Francesco Morace (see 2011), who implicitly is adopting a configurational paradigm. In this model, it's about configuring a pattern of quite abstract relationships that become a kind of wildcard to be played inside different cultural spheres, after having of course been sufficiently original and creative in denominating the trend in a smart way.

It is quite a paradox, but this work of the agencies about trends is not supported by a consistent literature. One of the few important references is the work of the sociologist Vejlgaard, who wrote *Anatomy of a Trend* in 2007. In that book, he tries to let certain invariants in different social processes of changing emerge. Even if the perspective is a sociological one, it can be considered a good premise to a possible semiotization of the trends, since he is interested in the shape of the process and in the way the transformations involve certain kind of identities, modifying their relationships during the process. He discusses different historical cases of big international change (the introduction of the jeans, the launch of the I-pod, the spread of the motorcycle, the explosion of beer consumption in some countries) and arrive to determine a general syntax of the trend, from *incubation* in specific places (typically the big metropolis all around the world), to *explosion*, to *mediatization*, to a progressive *diffusion* until the trend becomes mainstream. After this last transition, the trendy character is no more perceived.

He also sketches a portrait of the social identities that are distributed inside a set where the different attitudes toward the trend are manifested. As a consequence, the role of the trendsetter, the follower, the early mainstreamer and the conservative appear. The relevant point is that these forms of life are determined only by the degree of assumption of the trend, composing this restricted set of possibilities. As a further element, Vejlgaard distinguishes trend from short fashion, using as differential traits the temporal extension (restricted in the case of the short fashion) and the capability of a change to become engine of markets, to the level of production and not only of consumption (one of the main feature of the trend). His approach, finally, generalizes the process of the trend that makes it indifferent to any eventual specificity of the social and meaningful phenomena involved during the process itself. We could say that he, at the end, reduces the trend process to a fashion system. An already given paradigm of identities, a given syntax of the process: only the social substance that is invested by this shape is changing.

3. Interpretative models of trends

After the presentation of the three discursive regimes of the trend, it is worth noting that we could map how the trends are interpreted and supposed to work, generating three other models. The simplest case is the *pure fashion system*. An example can be the aforementioned thematization of the purple color of food for Food-Network. It is about a pure fashion system because the range of variability is already given, it's only about passing from a dominant position to another one, in a play of substitutions and *repechage*. Who is representing the trend in this way, can try, in some case, to find out a form of rooting (in the quoted case, the author opens on the website an historical parenthesis about the symbolic valences of purple) but this is only a rhetorical operation, since it is just masking the merely differential functioning of the trend. The purple was an option, potentially trendy, because was a disposable choice inside the paradigm of the usable

colors.

A second model works on the extension of the paradigm: the trend lets appear new cases that immediately can be re-embedded inside a relatively closed system. The novelty effect is what counts in this case. For instance, following the point of view of the culinary practices of preparation of food, the technological innovation (take the trend of the “accessible sous-vide” as an example⁵) extends the possibilities of cooking and is then part of this second modality of innovation.

The third and last case concerns innovation and experimentation, which involves a kind of exit from already known paradigms and require to follow the phenomenon in the way is interpreted by the social actors that are part of it. It is as if we were in presence of a live semiotic production, a kind of social laboratory. If a genealogy of this type of trends is still and always possible (and even wished), their destiny is not. The experimental character is immanent to the trend: we don't know what that process will socially generate and the only chance is to follow the progressive determinations that it will eventually produce, its capability to be articulated with other practices and above all its capacity to intercept alternative forms of file. Following again the suggestions of Basso Fossali, the trend, in this case, presents a constitutive play, being assumed by the social actors in many different ways. Trends of this type let explode their semiotic complexity, given by the way the different levels of constitution of meanings are combined or re-combined. They are meanings conglomerates or formations that require an interpretative effort in order to grasp the internal tensions and the modalities of articulations. The “what is trendy” in a trend, the phenomenon pointed at, is exactly an open question. At that moment, finally, the semiotic skill can operate and propose its contribution.

The lesson we take from this transition through different models about trends is first of all that there is no need to find out or invent new original trends: not only semiotics is not a statistical discipline like could be sociology, but the trends that are already thematized as such in one of the three discursive spaces present inside the social, are implicitly asking for an effort of articulation and interpretation, emphasizing the semiotic possibility to follow and describe the mechanisms of meaning. Once you decide to work on a specific trend, the relevant point is the decision about the strategy of analysis, especially observing which entry level (in the Fontanille model) could be the most interesting from a methodological point of view. If we are analyzing an app, as in our following case, the main problem is articulating the object properties, the interface, with the practices and the strategies of use. The further step is the attempt to consider how identities are involved and if some “form of life effect” is present. The last step, finally, is the extraction of some core feature of the trend, in order to see if they can be exported.

4. Analyzing trends: the case of Foodspotting

Let's arrive to discuss more in depth an example of trend without presenting here, more in general, the frame of the transformations inside the food domain, i.e. the values that became dominant, mainstream or trendy⁶. The only aspect we would like to recall is that inside the food domain contradictory trends take place at the same moment, stressing, as a consequence, contradictory valorizations. This is just to reveal the living character of a culture that is not a fixed monument. These paradoxical pushes can be seen for instance in the opposition between trends that insist on the affective body (the comfort or the soul food, as is typically labeled) and others that evocate more the pragmatic body (the functional food); furthermore, we can observe trends that work on transitive valorizations (the ethical aim of sustainability) and other on reflexive

⁵ See the link to the The Huffington Post gallery of trends (2011).

⁶ For a general presentation of food trends inside a moving food landscape, see the work of Aegis Media and Deepblue (2009).

ones (the search for new testing experience), just to quote the most visible ones.

One macrotrend inside the food domain has to do with the changing forms of sharing meals and food experiences, especially thanks to new technologies and media, that are clearly splitting the actual experience of food (eating) from the projected linguistic and discursive existence on a digital platform (the participation to a virtual community).

We will focus now on the example of an app that became quite popular in US after its introduction in 2010, recording 800.000 downloads in a few months, with a lot of following initiatives connected with the world created around the app⁷. Its name is Foodspotting, an app dedicated to photograph food all around the world. The app contains a big database collecting users photos restricted to the dishes (not people, not the places), a database that can obviously be consulted by the users. How this app is participating to the changing world of food, becoming trendy? How is redetermining food identities or the identity of the user/consumer?

This is not the place to discuss the first methodological step of the analysis, the deconstruction of the interface of the app⁸, so, we prefer to consider how the app participate to promote specific practices. In the first release of the app, it was clear that each user could become a potential cataloger, which did not seem an intriguing perspective. You could “spot” a dish and photograph it, maybe being the first to record that dish in that specific place. The photo become part of the community where it can be appreciated or commented by others with a set of pre-determined possibilities (three buttons: “like it”, “want it”, “tried it”). When you take the photo, the social dimension of the community is only virtualized, since the others are not necessarily connected and the app is supposed to work in a desynchronized modality. One main point is that Foodspotting, initially, promoted a kind of pioneer being part of the enterprise of creating a unique database containing all the dishes of the world. The user had the chance to be the first to document a specific dish, feeling himself like a kind of explorer that could refresh his/her own relationship with the nondomestic consumption. Such a pioneering dimension is crucial in the key of the experimentation of the identities inside the trend. Indeed, Foodspotting intended to bypass the more traditional and institutional forms of the gastronomic guide, highly engaging in this explicit polemics. In short, no more discursive mediations that tell you something about the identity of the place (the restaurant) or of the chef, on the contrary, you are immediately put in the straight presence of the dish. The technology is introduced in the most intimate contact with food, the moment just before the consumption. Taking into consideration the life of the app, it is possible to argue that the transition to the 3.0 version of the interface was the moment of conversion of Foodspotting from being trendy to being mainstream (also after the arrival of Instagram). Not surprisingly, they changed the relationship between the two main actions inscribed into the interface, taking photos or consulting the database. They equalized the two, changing also the logo, suggesting that the taking of photos could be just an option, not the main goal of the app, like it was in the first version of the app. What happened, actually, is that people started to use Foodspotting exactly like a substitute of a guide, being less interested in taking photos during the meal.

There are many aspects in this phenomenon that should be considered for our purposes. One is that the *remediation* of the dish⁹, let's say, monumentalize it without debating it. The photo fixes an idealtype and exclude the taste from the relationship with the dishes. There is a complete vanishing of a critical gastronomical dimension and the photographic act replicate a standard solution, under the sign of a “having-to-do”.

⁷ For a thematization of Foodspotting like a trend, see Fulco (2011).

⁸ See Festi (2014).

⁹ We refer here to Bolter & Grusin (1999).

A further step in the trend deconstruction is the extraction of the core structural elements. In this case, where are they? I would say that the crucial pattern is the remediation of a previously non mediated moment (the effective consumption of food) and the enhancing of the coalescence between the digital life and the actual experience. The first point is what justified this pioneer form of life of the foodspotter, the *tabula rasa* of the gastronomic knowledge and the recreation of a photographic community of food enthusiasts. A kind of verification of this feature extraction is the development of a countertrend, the resistance to the over-mediatization of the restaurant experience. Some restaurants (starting in NY City) decided to display, on the entrance window, the poster “deinstagrammed restaurant”.

Once we get the general features of the trend, we can develop unusual comparisons looking for similar or dissimilar patterns inside different social phenomena. For instance, another trendy social transformation, connected again with the new media, has been related to the launch and development of the website “fridge watcher”. The main idea is to take a photo of one’s own fridge in order to witness some aspects of a personal identity (a kind of transposition of the motto “tell me what you eat and I will say who you are”). In this case, in analogy with Foodspotting, the remediation has been introduced in an intimate and original space, before consumption, with the idea of a direct contact with an identity, a revelation effect of a very personal place. Here again, a community aspect is involved, and the photographic act is the proactive element aggregating people. This is to say that the core feature of a trend, quite abstract in their relational pattern, can be embedded inside apparently very different or distant social phenomena.

Again, let’s consider the trend, inside the restaurant world, that had to do with the introduction of massive quantity of technology in the space of the table. Screens could appear under the dish, where you could “spy” the chef preparing your dish, live, inside the kitchen, monitored by a camera, like in a realty show. Inedited remediation, again, of a moment anticipating the consumption, again. The same features are then recurrent and make probably evident that the gastronomic world is exploring – is the laboratorial dimension of the social evoked before – new ways of mediatization of the practices linked to the acquisition, the preparation and the consumption of food. In the last case mentioned, on the contrary, a dissimilar aspect in relation to the two other cases is the access to the social dimension that is not relevant here. The community, indeed, is supposed to be already present around the table. This trend is more about offering new topic occasions, while watching at what happen in the kitchen.

5. Conclusion

In this article, we explored the possible contribution of semiotics for treating the marketing concept of trend. Analyzing a trend and not just recognizing it, involves an articulation of different layers of meanings, as we tried to demonstrate in the discussion of the Foodspotting case. Following the transformations in the social practices, observing how the identities and their values are redefined by the trend, elaborating a set of core semiotic feature of the trend, are the main operations of analysis that can be proposed by a semiotician. Once the core features that make a trend interesting to think and interpret are extracted, the analyst can start all kind of reflections with the eventual client, in order to strategically re-assume a trend inside a marketing perspective. This is the topic of another research work to come: how to pass from the trend to the brand.

INTERACTIONS AND BEAUTY ADVERTISING

Jean Henaff
Henaff Marketing Office, France
jkhenaff@yahoo.fr

Abstract

Dans le domaine de la communication publicitaire, le modèle d'analyse souvent utilisé est celui de la sémiotique narrative faisant appel à la *jonction*. Dans le monde réel, tout d'abord, l'objectif du fabricant (énonciateur publicitaire et destinataire) est de manipuler le consommateur (destinataire qui se constitue en sujet) pour qu'il achète le produit (se *conjoigne* au produit). Dans un film publicitaire, la transposition fictionnelle du schéma ci-dessus conduit à représenter un consommateur (destinataire qui devient sujet) qui se « *conjoint* » à un produit (une voiture, un shampoing, un rouge à lèvres...), et à l'ensemble de « valeurs de consommations » (pratiques, ludiques, utopiques, critiques, pour reprendre la terminologie de JM Floch) que concentre ce produit.

L'observation de nombreuses publicités dans le domaine de la beauté montre cependant une grande variété de types de récits. Certains films ne présentent que le produit, le destinataire n'étant que suggéré : le récit principal est dans ce cas celui d'un produit-sujet qui se « *conjoint* » à des valeurs (bénéfiques) destinées à une consommatrice-destinataire. D'autres présentent la consommatrice-destinataire comme un personnage majeur, qui se constitue en sujet d'une transformation (un embellissement), et le produit est lui-même évoqué seulement comme un adjuvant. D'autres enfin donnent aux deux types de récits une importance assez similaire. De plus, on observe suivant les publicités deux types de destinataires : la marque qui fixe les bénéfices beauté valorisés, ou la consommatrice qui fixe elle-même les objectifs beauté à atteindre. Nous présenterons différentes publicités pour illustrer ces points. Un des enjeux plus généraux est finalement la représentation de la femme dans ces publicités : sujet actif de leur embellissement (maître de sa beauté), ou destinataire passif d'une forme de beauté fixée par la marque et apportée par le produit (et à qui on impose une forme de beauté)

Ensuite nous aimerions voir si le *modèle interactionnel et le concept d'union* (au lieu de la jonction) de E Landowski pourrait permettre de rendre compte d'une manière plus subtile des enjeux de communication publicitaire dans le domaine de la beauté et d'ouvrir des possibilités d'évolution de cette communication. A ce propos, nous présenterons une récente communication de marque qui a pris le parti de proposer la « *beauté idéale* » (et non la « *beauté parfaite* ») comme valeur de marque. La beauté idéale se définit en effet comme ce qui est « *la perfection pour soi-même* » (à chacune sa beauté idéale): les finalités de l'interaction entre la marque et la consommatrice ne sont pas décidées par la marque a priori mais se définissent dans l'évolution des rapports entre la marque et chaque consommatrice. Il s'agirait ici d'un régime *d'ajustement* qui permettrait un véritable *accomplissement* des deux partenaires, et donc également de la consommatrice.

The intention of a beauty product brand is that its consumers will feel more beautiful, and this accession to beauty is largely depicted in advertising. The purpose of this communication is to share some thoughts on how this accession to beauty can be semiotically described. To do so, we will consider two levels, and the way they relate to each other.

	Addresser	Subject of doing	Subject of being	Object	Addressee
Case 1	Brand	Product	Consumer	Beauty	Consumer
Case 2	Consumer	Product	Consumer	Beauty	Consumer
Case 3	Brand	Consumer	Consumer	Beauty	Consumer
Case 4	Consumer	Consumer	Consumer	Beauty	Consumer

Table 1: Different actualizations of addresser and subject of doing in beauty advertising.

Case 1 can be illustrated by a recent skin care advertisement: “*Lancôme’s new vision for the perfect skin. Advanced Skin Corrector Visionnaire LR 2412 supports wrinkles, pores, and skin texture improvements to change the skin towards perfection. Visionnaire Lancôme*”

The brand (“*Lancôme*”) is setting (“*new vision*”) what is the goal (beauty, defined here as “*the perfect skin*”). The product (subject of doing) is like a hero whose mission is to bring perfect skin and who is empowered by the Lancôme technology (“*LR 2412*”) and therefore able to eliminate defects and change the skin. The women represented in the advertisement are the addressee and the passive subject of transformation (subject of being), transformed by the product into a perfect skin state.

Case 2 is when the woman-consumer (represented woman in the advertisement) is acting as the addresser setting what is the beauty goal and launching the product action. It can be illustrated by another skin care television advertisement where the woman-consumer is represented in the first scene as aiming at a target with a bow and arrow and saying: “*what I am aiming at: less wrinkles, more firmness*”. She then launches the arrow, as a symbol of the product action released by the woman. The second scene is showing the arrow transforming into a schematic representation of active ingredients penetrating into a skin close up section and visibly improving the surface of the woman’s facial skin. The represented woman is also in this advertisement the addressee and the passive subject of transformation (subject of being). In the end of the advertisement she is also validating the performance (“*objective is reached!*”).

Case 3 can be illustrated by a Japanese magazine advertisement for a make-up removing product that “*instantly resets into a bare skin beauty*”. The advertisement is showing two photos of the same woman: on the left she is perfectly made up, on the right she is represented without any make up, “bare skin”, and she is looking much happier than on the left. The advertisement is introduced by the sentence: “*and you, can you become a bare skin beauty too?*” In this advertisement the brand is the addresser setting the desirable beauty goal as “*bare skin beauty*” and manipulating the consumer (subject of doing) by challenging her to transform herself from artificial “made up beauty” into “bare skin” (natural) beauty thanks to the help of the product. The woman-consumer is in this case the subject of doing, the subject of being and the addressee.

Case 4 is when the represented woman-consumer is acting as four of the key actants: addresser, subject of doing, subject of being and addressee. In a Revlon lipstick television advertisement for example, the woman-consumer is represented by the celebrity Emma Stone who is speaking throughout the commercial. The advertisement is starting by Emma Stone saying “*don’t hide behind your lipstick, use it to share with the world how you feel*”. Then she selects a lipstick color among many and applies it on her lips. In the end she leaves her home saying: “*today I feel daring*”. The represented consumer is acting as the addresser as she is setting up the goal and the challenge to accomplish for herself (and for the women who are watching the advertisement): to use lipstick to create an expressive beauty. It is a case of self-manipulation into acting for the beauty transformation (the addresser manipulating the subject of doing and the subject of doing are represented by the same person).

The greimassian approach is efficient in describing and categorizing the different types of narratives of beauty advertising. However, this model can also appear as a simplification of phenomena that are in fact more subtle. This can be felt already when we consider beauty advertising, but it is even more so when we consider the way women relate to beauty brands and products in real life to beautify themselves.

For example, one could consider that the setting of the beauty goal is in fact not done by the brand or the woman-consumer alone. It could be considered as the result of an interaction between two addressers: the beauty a woman wants to achieve can be influenced by the models promoted by the brand but fine-tuned also by herself to her own taste. Furthermore, one could also consider that when the woman-consumer is using a lipstick for example, the beauty result that is achieved is the result of the interaction of two subjects of doing: the woman who is using the lipstick with more or less dexterity and the lipstick itself that is transforming the color of the woman’s lips. Also, there is also a possible interaction between the beauty object and the consumer: beauty is not only a standard object that one can put on one’s face like a mask, it is something that is changing the woman’s appearance, experience and identity.

These limitations of the greimassian model have been pointed out by Eric Landowski who has developed a model of interactions between actants that could help to describe those different types of interactive situations as we are going to see in the next section.

2. Eric Landowski’s model of interactions and its application to analyze the different types of access to beauty in everyday life

Eric Landowski (2005) has developed a model of four types of interactions, where the manipulation (defined as the cognitive manipulation of the other’s will) is only one specific case among the four. The four types of interactions are the following:

	Programming	Manipulation	Adjustment
Brand/consumer	Enforcement of a beauty stereotype that has to be followed by the consumer	Presentation of a valuable beauty objective that consumers are challenged to follow	Beauty objective is constantly negotiated as a common goal (depending on how the brand feels the consumer needs and how the consumer feels the beauty promise)
Consumer/consumer	Decision on the beauty objective and installation of a beauty routine (programming of a routine to follow)	Decision on the beauty objective and self-motivation to do the actions to reach it	Beauty objective is constantly redefined according to the beauty results as felt personally
Consumer/product	Decision on the beauty objective and “tuning” of the product, for precise control of beauty effects	Decision on the beauty objective and “motivation” of the product to achieve it (magic thinking)	Beauty objective is constantly redefined according to the product action as it is felt
Brand/product	Definition of the beauty objective and programming of the physical/ chemical capacities of the product in order to make it able to act precisely	Decision on the beauty objective and “motivation” of the product to achieve it (magic thinking)	Beauty objective and product capacity to act are constantly redefined according to the product action as it is felt

Table 2: Interaction addresser/subject of doing.

The interactions between the subject of doing and the subject of being can cover the interactions between product and consumer and those between the consumer and herself. The different interactions are summarized in table 3.

In the case of product/consumer interaction, a programming interaction is when the product operates on a consumer’s body that is supposed to react in a completely, or at least statistically predictable way. It is like a perfectly programmed medical treatment. But if we consider this interaction as a manipulation that means that we think that the consumer’s body is an entity with its own will that needs to be motivated. We can see some advertisements that are following this way of thinking, for example those which explain that the active ingredients will stimulate the skin mother cells in order that they produce more new cells. If the interaction between product

and consumer is an adjustment, which means that the product has to continuously adapt its action to the situation of each consumer and to the reactions of the body. For example, some moisturizing cream advertisement claims that “*may your age be 18, 30 or 45, may your skin be dry, normal or oily, this cream adapts its effectiveness*”. We can also imagine a product which action is adapting day after day to the changes in the skin needs.

In the second case, the interaction between the consumer and herself, programming is the situation where the consumer considers her own body as a passive object that can be repaired, decorated, sculpted... Manipulation is when the consumer considers that she can motivate her own body to do the transformation, for example when she is using massages to wake up her inner energy in order that new fresh cells are produced and her skin tone is improved. Adjustment is when the consumer thinks that she has to continuously adapt her actions to the reactions of her body, for example by fine tuning the quantity of cream applied according to the variations of the observed absorption speed of cream in order to keep an optimal level of moisture.

	Programming	Manipulation	Adjustment
Product/ consumer	Product is like a medicine, operating on the body with predictable results	Consumer's body is an entity with its own will, that needs to be motivated, or stimulated by the product, into acting by itself	Product has to continuously adapt its action to the reactions of the body
Consumer/ consumer	Consumer's body is like an object that the consumer can repair, decorate, sculpt...	Consumer can motivate her own body to act by itself	Consumer has to continuously adapt her actions to the reactions of the body

Table 3: Interaction subject of doing/subject of being.

With the concepts of programming, manipulation and adjustment, we have been able to describe in a much more complete way the interactions between addresser and subject of doing and the interactions between subject of doing and subject of being in the representations of everyday life. The interactions between the subject of being and the object have also been studied by Eric Landowski, with the introduction of the distinction between conjunction and union (Landowski, 2004), and this is also opening up ways to describe those types of interactions more in details:

The conjunction (“*conjonction*” in French) is when the subject is coming in possession of an object that is rather abstract, that can be acquired or discarded, exchanged. Its value is standard and fixed. The object stays in fact exterior to the subject and the very identity of the subject is not changed by its possession. The key word relating to the concept of conjunction is “to have”.

The union (“*union*” in French) is when the subject and the object are considered in their materiality that allows experiencing the sensorial characteristics of the object. Its value is coming from the personal and existential experience that the subject can have with it. The experience of the object is able to alter the very identity of the subject. The key word relating to the concept of union is “to be”.

The two concepts are also of high interest to describe the interactions between the subject of being (consumer) and the object (beauty) in the field of beauty. Conjunction is when beauty is considered as something quite standardized that has a social fixed value and can be acquired and possessed mainly for its functional properties (the seduction power that it brings): beauty is like a standard mask that one can buy and apply on one's face. Union is when beauty is considered as a concrete object (the embellished body) that can be experienced by the subject through her senses: the experience of her embellished body is creating the unique value of it for the woman-consumer and transforming her identity in depth.

In the last section, we will see through an example how these concepts can help to better understand the values promoted by a beauty brand and help to develop concretely the way the brand has to interact with its customers.

3. Implications for a beauty brand that is promising to reach “*your ideal skin*” in its slogan

A skin care brand introduced a few years ago “*your ideal skin*” as a brand slogan in all its advertisements. If we refer to the definitions of “ideal” in the dictionary we can find:

1. Satisfying one's conception of what is perfect; most suitable.
2. Existing only in the imagination; desirable or perfect but not likely to become a reality.

That means that “ideal” is close to perfect, but the two words are not completely the same. Perfect means “the best” and is universal, while ideal focuses on “the most suitable”, that is to say, it is “the best” on a personal level, it has to reflect each woman's personal aspirations at any moment and it has therefore to be changing, flexible, adjustable.

This means that to be able to provide “*your ideal skin*” to each woman-consumer, the brand will have to consider the various interactions as adjustments. The promise of beauty is not an imposed program, nor a dream that women are seduced (manipulated) into pursuing. This has implications in the way the brand is considering its interactions with consumers (interaction between addresser and subject of doing) and the way the product is supposed to interact with the consumer (interaction between subject of doing and subject of being). Furthermore, the beauty transformation is not to be considered as a conjunction with a standardized beauty object but as a union between consumer and beauty that could be able to transform the identity of the consumer.

If we consider the interaction between brand and consumer as an adjustment, this means, as seen in the previous section (table 2) that the beauty objective will have to be constantly negotiated as a common goal between the brand and the consumer. The brand will have to go beyond the traditional approach of consumer understanding, that is usually based on a cognitive perception of the consumer needs mainly by statistically gathering facts and figures. The brand will have to develop a real feeling for the consumer: the points of contacts between the brand and the consumer will need to be personal and human (for example, through beauty advisors in stores who are trained to interact with consumers in a way that goes beyond rationality and will allow them to really feel and not only understand what each consumer needs, without using standardized diagnostic methods).

If we consider the interaction between product and consumer as an adjustment, that means that the product will have to be adjustable to each woman's skin, whatever its reactions and changes through time. The different products proposed by the brand will have to provide an action that will change according to the situation of the skin and the way the skin reacts.

Finally if the beauty transformation is considered as a union that changes the identity of each consumer, this will have radical implications in the way the brand is communicating through advertising: presenting a photo of an attractive woman as a standard beauty model will not be

enough.

The way to represent adjustment and union in brand advertising is a challenge that will need further investigations.

Abstract

In the general theme of sensory marketing point of sale, we present an introduction to the reality of the sonic environment, especially the various forms of tackling to nuisances and valuing of silent atmospheres. This is a priority for research on phenomena of sonic environment in order to increase the quality of a point of sale.

The hypothesis is to allow customers to pause in our environment from incessant advertising solicitations conveyed in all media, including mobile technologies, to benefit from tranquility area in a Zen space, which becomes a form of fun shopping with the objective of increasing the sale.

We live in a world characterized by the constant increase in the number and volume of sound signals, which end up being perceived as intrusive messages. Silence is a certified value in a society of noise, it not only turns into commercial value, but also moral, aesthetic and ecological. In semiotic terms, it becomes a valuable object: its rarity gives it the status of "object" luxury emerges from storyboarding and set specific discourse.

Résumé

Dans la thématique générale du marketing sensoriel du point de vente, nous proposons une introduction sur la réalité de l'environnement sonore, plus particulièrement les différentes formes de lutte contre les nuisances et la valorisation d'ambiances silencieuses. C'est un préalable nécessaire à la recherche de phénomènes d'ambiances sonores pouvant augmenter la qualité perçue d'un point de vente.

L'hypothèse est de permettre à la clientèle de faire une pause dans notre environnement de sollicitations publicitaires incessantes véhiculées sur tous les supports, y compris les technologies nomades, pour bénéficier d'une zone de quiétude dans un espace Zen, qui devient une

modalité de *fun shopping*. L'objectif est une augmentation des ventes.

Nous vivons dans un monde caractérisé par l'augmentation incessante du nombre et du volume des signaux sonores, qui finissent par être perçus comme autant de messages intrusifs. Si le silence est une valeur attestée dans une société du bruit, il se transforme en valeur commerciale, mais aussi morale, esthétique, écologique. En termes sémiotiques, il devient un objet de valeur : sa rareté lui assure le statut d' « objet » de luxe qui émerge de scénarisations et de mises en discours spécifiques.

Introduction

Avec la progression technologique, le monde moderne est devenu le lieu de la profusion sonore : bruits de machines, de transports, de métro... Le bruit envahit notre environnement, gêne une majorité de gens et diminue la santé et la qualité de vie. Robert Koch¹ disait il y a 100 ans: « *Le jour viendra où l'homme devra combattre le bruit comme la peste.* » (CONCORDIA 2014 n.d.)

De ce fait, nous vivons dans un monde bruyant, dans le contexte sonore de la modernité, le silence est devenu l'exception, du coup, nous sommes en recherche constante du silence. Pour cette raison, le silence est une vraie valeur dans une société du bruit.

Aujourd'hui, le confort sonore est un grand enjeu de la qualité de vie. Nous avons le goût d'acheter le silence. Par conséquent, les comportements liés à nos activités quotidiennes peuvent se trouver en partie influencés par la valeur-silence. Il en va ainsi de nos comportements d'achat. Du coup, le silence se transforme en valeur commerciale. Dans ces dernières années, l'industrie de l'isolation s'est largement développée. Les maisons, les bureaux, les ateliers, les machines sont isolées ; les bruits inévitables sont réduits. Le silence est devenu, depuis les dernières décennies, et surtout depuis les années quatre-vingt, une référence commerciale dans la promotion touristique d'une ville, d'un séjour, Les agences publicitaires ont aussi perçu la valorisation nécessaire du silence dans une vie quotidienne. Les industriels du design sonore accentuent sur le silence du moteur d'une automobile, des appareils ménagers, etc.

L'objectif principal de cette recherche est de célébrer le pouvoir du silence. Pour comprendre mieux le terme du silence, nous étudions la notion contraire : le bruit qui est un son perçu comme investi d'une valeur négative, une agression contre le silence. Grâce au carré sémiotique, nous pourrions établir la relation de contrariété entre les notions du silence et du bruit :

Silence	Bruit
Non-bruit	Non-silence

1. Le Silence

« Le silence est la matière signifiante par excellence, un continuum de signification. Le réel de la signification est le silence. » (Orlandi 1996 : 29)

La linguiste brésilienne Eni Orlandi, dans son livre «*Les formes du silence: dans le mouvement du sens* » déclare que le silence est un lieu de mouvement du sens. Pour elle, le silence est l'indice d'une totalité signification au contraire de l'idée du silence vide de sens. Le silence produit du sens relativement par rapport au mot attendu ou mot manquant. En fait, le silence n'est pas signi-

¹ Robert Koch (1843–1910), Prix Nobel de médecine, a découvert le bacille de la tuberculose.

fié en soi, mais par rapport à un autre signifiant. Son contenu dessine dans le fil du discours des effets de sens : ouverture, clôture, interrogation, attente, complicité, admiration, étonnement, tristesse, soumission, etc.

Le silence n'est jamais une réalité en soi, mais il est toujours en relation avec le monde humain et son rapport au monde. Le silence est parfois si intense qu'il sonne comme la signature d'un lieu.

Scientifiquement, le silence est un son à zéro décibel que nous ne pouvons pas trouver en dehors des chambres acoustiques. Même dans la nature, le degré zéro du son n'existe pas. Tout milieu résonne de sons particuliers. Les hautes montagnes ou les déserts ne sont pas tout à fait muettes. Un souffle d'air imperceptible fait monter les décibels à dix.

Le silence se détermine comme un rapport au temps. Les figures de silence représentent la durée de l'interruption entre les sons. La durée du silence remplace le temps du bruit.

Le silence en marketing sensoriel a souvent une influence négative sur le comportement d'achat. Il apparaît que s'il n'y a pas de musique, les clients passent moins de temps dans le magasin, dépensent moins, sont de moins bonne humeur, discutent moins avec le personnel de vente et sont plus stressés. (Jallais & Rieunier 2013 : 62)

Dans la suite de l'idée de silence dans les espaces commerciaux, nous pouvons nous référer à des résultats d'une étude qualitative de Sophie Rieunier auprès de 24 vendeurs des magasins de vêtements: les vendeurs décrivent ces espaces dans l'absence de musique :

« *Glaciale, sans âme, sans vie, triste, vide, bizarre, désagréable, fade, froid, maussade, monotone, mou* ». (Jallais & Rieunier 2013 : 61)

La question du silence a été abordée par une dizaine de chercheurs de manière quantitative. D'après les résultats des recherches, nous pouvons retenir que la présence de silence influence :

- de manière négative le temps passé (Yalch et Spangenberg, 1993) ;
- de manière négative la vitesse de consommation (Roballay et al, 1985) ;
- de manière positive l'attitude à l'égard de l'attente (Cameron, 1996) ;
- de manière négative l'humeur (vs. de la musique gaie ; Alpert et Alpert, 1990) ;
- de manière positive le stress de l'individu (Tansik et Routhieaux, 1996) ;
- de manière positive l'agrément ressenti vis-à-vis de l'atmosphère (North et Hargreaves, 1996).

En résumé, les recherches ont montré que le silence est négatif si le distributeur souhaite que les clients passent plus de temps en magasin, qu'ils soient de bonne humeur et déstressés. Par contre, les clients semblent être plus positifs à l'égard de l'attente et préférer l'atmosphère d'un magasin sans musique. Ces résultats vont nous confirmer de réaliser de plus amples recherches sur ce sujet afin de pouvoir caractériser l'influence du silence de manière positive ou négative. (Rieunier 2000 : 66-69)

2. Le Bruit

« *C'est au dix-neuvième siècle seulement, avec l'invention des machines, que naquit le Bruit. Aujourd'hui le bruit domine en souverain sur la sensibilité des hommes. Durant plusieurs siècles la vie se déroula en silence. Les bruits les plus retentissants n'étaient ni intenses, ni prolongés, ni variés. En effet, la nature est normalement silencieuse, sauf les tempêtes, les ouragans, les avalanches, les cascades...* » (Russolo 2003 : 9)

Cet extrait de *L'art des bruits, Manifeste futuriste* de Luigi Russello décrit le bruit comme un des critères de la modernité. La sensation de bruit s'est diffusée surtout avec la naissance de la société industrielle et la modernité. Nous sommes accoutumés à une civilisation bruyante qui ne nous rend pas sensibles aux évolutions des sons qui nous entourent. Le bruit est partout et

d'abord dans les villes.

Le bruit est partout et nous accompagne depuis notre réveil jusqu'à notre sommeil. Raymond Murray Schafer, le compositeur canadien, dans son livre affirme :

Aujourd'hui, le monde souffre d'une surpopulation sonore. L'information acoustique est si abondante que seule une part infime en est perçue de façon distincte. Dans le paysage sonore lo-fi poussé à son extrême, le rapport signal/bruit est égal à un ; à ce stade, il devient impossible de savoir, lorsqu'il y a message, ce qu'il faut écouter. (Schafer 2010 :107)

Le bruit est un phénomène complexe qui renvoie à l'idée de sensation désagréable, indésirable et insupportable. Cette perception négative est largement confirmée par les multiples dictionnaires et encyclopédies françaises. A titre d'exemple, le dictionnaire Larousse le définit comme « *un ensemble de sons sans harmonie* (Larousse 2008) ».

L'association française de normalisation (AFNOR) le présente comme la définition la plus complète : « *Le bruit est un phénomène acoustique produisant une sensation auditive, considéré comme désagréable ou gênante.* » (TDC 2000 : 6)

Le bruit, premier facteur perturbateur du sommeil, provoque difficultés d'endormissement et réveils nocturnes. L'influence des bruits sur le comportement et sur la santé des individus, des facteurs de stress tels que le bruit, la pollution sonore. Pour exemple, les niveaux de bruit élevés peuvent provoquer l'augmentation de la pression du sang, des ulcères et d'autres maladies liées au stress. (Siberil 1994 : 13)

Selon le rapport 2011 sur l'état de santé de la population en France, 11% des Français rencontrent des difficultés d'audition. (TDC 2012 : 16)

En fait, le bruit dans notre société est responsable de :

- 11% des accidents du travail ;
- 15% des journées de travail perdues ;
- 20% des internements psychiatriques.
- En France, parmi les habitants de ville :
- 43% sont gênés par le bruit ;
- 87% considèrent le bruit comme une nuisance insupportable ;
- 39% le jugent responsable du stress. (Agence de l'Environnement et de la Maîtrise de l'Énergie n.d.)

Il est important de préciser également que la sensibilité aux bruits est différente selon les individus. En effet cette dernière peut dépendre du milieu de vie de la personne. Aussi, les personnes qui habitent près des routes ou des lieux bruyants, vont entendre certains bruits différemment. Par exemple, les circulations des voitures, les klaxons, au fur et à mesure du temps, vont être intégrés comme des bruits du quotidien et ne seront plus jugés comme des nuisances.

Enfin, nous pouvons faire part d'un autre élément qui joue sur cette sensibilité de l'individu : la régularité sonore. Contrairement à ce que l'on peut penser, nous supportons plus facilement des sons avec des décibels élevés si ces derniers sont continus, que des sons dont nous pouvons contrôler leur régularité.

Quelquefois la musique se transforme en bruit, en nuisance. Le volume élevé inciterait les gens à rester moins longtemps dans le lieu de vente (Assadi, Djamshid 2008 : 38). Dans ce cas, l'ambiance musicale agresse les consommateurs et les empêche au plaisir d'achat (Siberil 1994 : 13).

3. Non-bruit :

Tous les bruits ne doivent pas être considérés comme des pollutions sonores. En effet, lorsqu'ils font partie de l'environnement sonore de notre vie quotidienne, nous nous habitons à ces derniers et ils deviennent parfois synonymes de confort. Murray Schafer explique que le bruit des véhicules à moteurs est un « *son sacré* » (Schafer et al. 2010 : 267) contemporain. Il précise que le bruit est symbole de la vie et que par exemple les bruits des véhicules sont entrés dans la culture des habitants de la ville. De nombreuses sociétés paraissent particulièrement accueillantes à des productions sonores qui seraient classées comme bruits. La télévision, la radio en haut niveau sonore, le vacarme du trafic dans les rues etc., sont des expériences communes dans les grandes villes orientales.

En général, le son est une sensation auditive qui véhicule des informations nécessaires pour le cerveau. Il transmet des informations sur la source. Les objets produisent des bruits et nous les recevons. Notre cerveau les reconnaît grâce à nos expériences et à notre mémoire. Le son et le bruit d'un objet sont concernés par son usage et sa fonctionnalité comme le moteur d'un aspirateur et le bruit de claquement de portière de voiture, etc. Les industriels du design sonore sont intéressés par cette capacité. Ils ont bien compris que le bruit des objets peut transmettre des informations et de la valeur et à certains moments, des qualités du produit. Dans ce cas-là, le bruit peut devenir un argument marketing sonore.

Le designer sonore utilise le son de l'usage du produit comme un évocateur de certaines valeurs du produit. Ainsi, le son est une dimension de l'objet que le designer élabore pour améliorer la qualité sonore du produit.

4. Non-silence :

Il est vrai que, dans la vie quotidienne, la plupart des gens n'est intéressent pas par le silence. Ils écoutent de la musique pour remplir le silence de leur quotidien. Les gens veulent du silence mais ils ne peuvent éviter le bruit pour rappeler qu'ils ne sont pas seuls.

Dans la société occidentale, le silence est négatif. Il représente le vide (Schafer et al. 2010: 365). De ce point de vue, l'homme moderne craint l'absence de son, car il craint l'absence de vie. Certains artistes cherchent à donner une « présence » à l'absence, au vide du silence. Cette vision est influencée par la conception extrême-orientale du silence : le vide n'est pas un sens négatif et ne signifie pas toujours l'absence. Le silence n'est pas comme un manque, mais comme l'ouverture d'un espace, comme une réelle présence. Mais comme un lieu de mouvement – mouvement des sons, mouvement du sens -, le silence devient alors un degré de perception

Dans cette perspective, John Cage, compositeur, poète et peintre américain, propose en 1952, sa pièce *4'33"* (*4'33"* de silence). Dans cette pièce, il nous prouve que le silence n'existe pas puisqu'on entend toujours des sons : « Les auditeurs se sont mis à parler à voix basse, certains ont quitté la salle, d'autres se sont énervés quand ils ont réalisé qu'il n'allait rien se passer et ils ne l'ont pas oublié trente ans après. Ils sont encore fâchés. [...] » (Kostelanetz et al. 2000 : 105–106). Dans cette pièce, il nous montre une autre manière d'écouter le son, les bruits ; il réveille en nous la sensation du son. Le silence, ici, est un silence plein de bruits.

En fait, l'idée de cette pièce est venue chez Cage, au moment de visiter une chambre anéchoïque² dans l'université de Harvard en 1951. Il souhaitait alors entendre ce qui se passait dans un lieu totalement privé de sons et avait été surpris de percevoir en réalité deux phénomènes acoustiques, l'un aigu et l'autre grave qu'il ne parvenait pas à identifier. Il écrit plus tard : « j'entendis deux bruits, un aigu et un grave. Quand j'en ai discuté avec l'ingénieur en charge, il

² Une chambre anéchoïque est une salle d'expérimentation dont les murs et le plafond sont totalement absorbants aux ondes sonores ou électromagnétiques, donc ne provoquent aucun *écho* venant perturber les mesures.

m'informa que le son aigu était celui de l'activité de mon système nerveux et que le grave était le sang qui circulait dans mon corps ». (Kostelanetz et al. 2000 : 119) Cette expérience aboutit l'affirmation suivante : « le silence n'existe pas. Il y a toujours quelque chose pour produire un son ». (Cage 2003 : 191) Parce que nous sommes toujours entourés de son. Ce que révèle l'expérience de Cage, c'est que personne ne pourra jamais faire l'expérience du silence absolu. Nous pouvons considérer donc le silence comme une absence du son. Cette expérience nous montre que cette absence n'est jamais absolue.

En somme, chez John Cage, le concept de silence est « la présence d'une absence », le silence oscille entre une absence sonore et une présence de bruitage. Il veut changer la définition classique du silence. Ainsi nous avons vu que le silence n'est pas vraiment l'absence de bruit, mais plutôt un niveau de perception des sons.

Dans chaque contexte sonore, il existe un seuil de bruit en deçà duquel le silence règne, c'est-à-dire en deçà duquel le son est inaudible. L'oreille aurait pu l'entendre, mais elle n'y pas porté attention. La mémoire l'a oublié, il n'a pas fait trace. Il n'a, pour l'auditeur, jamais existé en tant que son, mais en tant que silence. Un tel silence, parfois, se nomme *bruit de fond*. (Bonnet & Szendy 2012: 45)

Le bruit de fond est identifié comme un son qui n'est pas présent mais pas il est tout à fait absent. C'est pourquoi Schaefer exprime à la fin de son livre comme un résumé : « toutes les recherches sur les sons ne peuvent se conclure que par le silence- pas le silence vide et négatif, mais le silence positif de la perfection et de la plénitude. Ainsi, de même que l'homme aspire à la perfection, tout son tend vers le silence et la vie éternelle de la musique des sphères. » (Schaefer et al. 2010 : 373)

Il y a plus de quarante ans que les chercheurs ont commencé à s'intéresser à l'influence de la musique d'ambiance sur les comportements des clients. En 1966, pour la première fois en France, les résultats de la première expérimentation sur l'influence de la musique sur le comportement des clients sont publiés. (Rieunier 2000 : 20)

Il y a des effets directs de la musique d'ambiance sur les comportements de l'acheteur. La diffusion de la musique influence les comportements d'achats des clients dans les différents contextes commerciaux comme : supermarché, restaurant, magasin de vêtements, banque, ... La musique est un stimulus qui peut influencer les réponses des clients. Le marketing musical désigne donc l'ensemble des techniques et des stratégies qui utilisent la musique comme outil d'attribution, d'évocation, de différenciation, de mémorisation et de promotion d'un produit ou d'une marque. (Delassus 2011 : 6)

En se référant aux résultats des recherches précédentes, dans les magasins silencieux et sans musique, le temps de visite des clients diminue. Ainsi, la musique d'ambiance est un principal stimulus pour le politique marketing. Mais il faut savoir quel type de musique diffuser pour chaque ambiance commerciale. Si nous avons bien choisi la musique d'ambiance, les clients restent plus longtemps et achètent un plus nombre d'articles. Avec cette ambiance agréable, le plaisir d'achat augmente.

Conclusion

Pour conclure, nous nous référons à un entretien électronique que nous avons passé avec le directeur marketing du Bon Marché, M. Guillaume Gellusseau sur cette question du "silence" au politique marketing du Bon Marché :

« Une des particularités du Bon Marché est de proposer une expérience d'achat différente des autres magasins, basée, entre autres, sur une sélection de marques et de produits particulier, un lien avec les arts et la culture, et un confort d'achat et de découverte auquel nous tenons beau-

coup.

C'est pour cette raison que nous maintenons dans le magasin des zones de pause qui permettent à nos clients de profiter du lieu et de ponctuer leur visite de respirations.

C'est aussi pour cette raison que l'ambiance musicale et sonore reste relativement discrète, soutenue par des partis-pris musicaux classiques (piano, musique orchestrale, jazz, pas ou très peu de musique de variété, rock, pop, etc).

L'ambiance musicale est aussi travaillée pour nos expositions temporaires, expositions culturelles notamment, le choix du silence étant parfois fait pour que les œuvres exposées prennent toute leur place.

Cette approche bienveillante et « non agressive » est pour nous un point de différenciation par rapport aux autres grands magasins afin que chaque visite soit pour nos clients un moment agréable et de détente. »

De fait, par ces mots soulignés, nous pouvons se présenter l'articulation des différentes notions qui nous permettent de définir notre carré sémiotique :

Bruit vs silence

Tension vs détente

Energie mobilisée vs économie d'énergie

Et pour étudier deux notions, nous avons deux dimensions : quantité (acoustique) et qualité (perception)

silence bruit

Acoustique : intensité nulle intensité forte

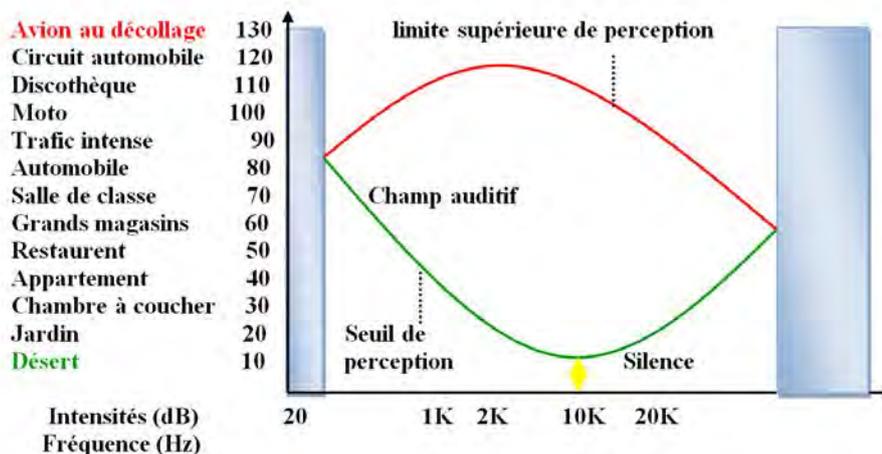

Perception : ambivalence réactionnelle = ou > au seuil** de refus, d'intolérance
(acceptation ou refus)*

non bruit non silence

Acoustique : intensité faible intensité perceptible

Perception : = au seuil d'acceptation, = au seuil de perception
de tolérance (si le signal est < au seuil de perception=silence)

* le silence absolu est en général angoissant.

** le « seuil », mesuré en dB, peut varier selon les individus et selon les cultures.

Le champ auditif humain (Centre Auditif de la Riviera :2014 n.d.)

Sur ce graphe, la courbe inférieure représente les seuils de perception de l'oreille humaine en parfait état (seuil d'audibilité). Pour chaque fréquence, le seuil de perception est différent. La courbe supérieure représente la limite des intensités perceptibles : au-delà, il y a douleur et/ou destruction cellulaire dans l'oreille (seuil de la douleur). La zone jaune présente sonore minimale, c'est le silence, mais cette zone, ça change par rapport à l'individu. Donc, le silence est une réalité relative pas absolue.

**MUSICAL
SEMIOTICS**

NEW MUSICAL SEMIOTICS? INNOVATION THROUGH TRADITION

Gabriele Marino
University of Turin, Italy
gaber.en@libero.it

Abstract

The essay addresses the problematic development of musical semiotics within general semiotics and in comparison with other applied semiotics. It is suggested that it is possible to recover key notions and analytical tools from the tradition of the discipline in order to develop Greimas' project further; namely, that the seed of innovation may be grounded in routes that have already been explored by the discipline, not outside of its domain. In particular, by referring to the proposal by Jacoviello, it is suggested to recover the semiotics of plastic arts or plastic semiotics, as elaborated by the Paris School with regard to visual texts such as non-figurative or abstract paintings, in order to deal with such an "ineffable" matter as sound and music.

0. Intro

In the capacity of the co-chair of the Musical Semiotics session of the 12th World Congress of Semiotics, along with Prof. Eero Tarasti (the session was held on Sept. 16, 2014, at the New Bulgarian University, Sofia, Bulgaria), by the present paper I would like to propose just some brief notes upon the topic of the symposium itself; namely, the dialectics between tradition and innovation within semiotics and, in particular, musical semiotics.

1. Rehearsing in the garage: Music as a semiotic *impasse*

As you all know, music is a problem – A big one. A *semiotic* problem and, at the same time, a problem *to semiotics*, as a discipline. Philosophers, musicologists, linguists, and semioticians have struggled for decades trying to identify the semiotic status of music: is it a *language* or not and, in case, is it analyzable like natural language (structuralist "annexationism"); is it a *sign* and which type of sign (index, icon, symbol); does it carry *meanings* and are these meanings im-

manent (autonomy, endosemantic hypothesis, introversive analysis) or not (heteronomy, exosemantic hypothesis, extroversive analysis); are these meanings *translatable* into words (verbalizability) or are they ineffable (iconic, anti-reductionist hypothesis)?

In opposition to the infamous glottocentricism of the discipline (namely, its preference for the verbal language), some authors (Ponzio and Lomuto, Kramer, Tagg and Clarida) have suggested to consider music – not verbal language – as a model of how meaning works in general, precisely due to the blurry and problematic semiotic status of such matter – Why should meaning be such an easy business? Both Goitre and Lidov, independently got to ask themselves: “Is language a music?”

The lexicon of semiotics, and its epistemological perspective, in the first place, were intimately contradictory, whereas not obscure at all, with regard to the musical domain. Benveniste claimed music was semantic, but non-semiotic. Lévi-Strauss was profoundly inspired by music, but still he claimed it had no actual meaning. Most of these issues, debates, and theoretical positions were actually pseudo-problems, but still they managed to slowing down the development of a dedicated branch of the discipline. Moreover, the peculiarity of the matter led to a semiotics which is very different from the other so-called applied semiotics.

2. Side one: The relationships with general and other applied semiotics

Musical semiotics grew by following a parallel course compared with so-called general semiotics, constituting, *de facto*, an independent, extremely specialized, and minority field, whose exchanges with the other so-called applied semiotics have always been scarce. As Tarasti maintains, “oddly enough, few of the great semioticians have said anything about music as sign” (2002: 4). Hjelmlev, Greimas, Lotman, and Eco, for instance, didn’t talk much about music. Barthes’ reflections on the topic were extremely fertile – think of the famous “grain of the voice” or to the notion of “somatheme” (the smallest somatic unit of meaning) – but still they were far from being systematic. Apparently, music was not worth a dedicated entry in the *Dictionary* edited by Greimas and Courtés; or, to be more precise, albeit a “Music” entry was originally featured in the 1986 volume (Castellana 1986), it was later expounded from the canonical version of the book.

As a matter of fact, as Monelle maintains, “the chief enterprise of music semiotics remains unfulfilled” (1992: 327), since there is no shared methodology among those who practice the discipline and their results are partial (they overlap with established musicological findings and they can be applied just to a small canon of works, critics maintain).

In fact, there is no such a thing as “musical semiotics”, but rather different musical semiotics projects (nearly as many as their proponents): there is the paradigmatic-stylistic analysis of the neuter level elaborated by Nattiez (in the footsteps of his masters Ruwet and Molino); there is a group of scholars and theories stressing the narrative component of music (Tarasti, Grabòcz, Samuels, Almèn); others focusing on music as gesture and embodied metaphor (Lidov, Hatten); others on the notion of “topic” (Monelle, Agawu); others developing a cognitive-interpretative perspective (Martinez, Cumming); there is the pragmatic, musical competence model elaborated by Stefani; and there is the inter-objective comparison elaborated by Tagg (based upon the notion of “museme”, coined by Seeger on the model of “morpheme”).

Most of these approaches do not even speak the same semiotic jargon; so that, great is the confusion under the sky of musical semiotics.

3. Side two: The intrusive influence of musicology

Musical semiotics has always been strongly tied to musicology, to its terminology, analytical tools, and ideology. We have to bear in mind that this branch of the discipline had started off with Ruwet, in the Sixties, as a method modelled upon structural linguistics to make the criteria

of musicological analysis explicit and, therefore, properly scientific. As a consequence, most of musical semiotics is prominently musicological (and it is often more musicological, rather than semiotic), and score-centric; namely, it is based on the analysis of the score, it reduces music, *de facto*, to its notated – or transcribed, *ex post* – form. But the score is no more the chief way to store music (we have had analogue recordings and now we have digital ones) and today we perfectly know that notation, as the grammar, and the score, as the medium, are to music what a screenplay is to the moving images – Just a partial summary.

Once, it may have been possible to claim that “even the best equipment and the most perfect record cannot give us nothing but music ‘in a box.’ The record is an important means of knowledge, but still it is a surrogate, which cannot replace the direct listening of music” (Maselli 1972: XI; my trans.). But, after the invention of the phonograph, namely after the development of a whole new sonic and musical aesthetics – which we may call timbric-acousmatic-phonographic (think of the Futurists, Varèse, Schaeffer, Chion etc.) – can we still analyze the score *on behalf of music*? Can we still be so *incredibly unprepared* to exploring the sonic richness of contemporary media?

4. Best of: The recovery of innovation (The plastic turn)

If we got an “invention of tradition” (Hobsbawm and Ranger), we have to be able to imagine a “recovery of innovation”; that is, we should be able to recovering notions and tools from our history in order to develop it further – To complete the routes. We can continue, and revive, tradition; we can still develop Greimas’ semiotic project, by extending the assumptions he has elaborated to new fields of inquiry. That would be an internal, disciplinary *bricolage*; using the – semiotic – available means to build up new – semiotic – ones. Our problem is the more or less “abstract” meaning of music; let’s try to recover the best available semiotic means to deal with this issue.

Structural-generative semiotics has provided a powerful tool to deal with those visual texts that seemed to question the disciplinary capability to translate them into words and analyze them. This tool is the semiotics of the plastic arts or plastic semiotics, as outlined by Greimas (1989; or. ed. 1984) and his research group within the Paris School (Thürlemann, Floch) with regard to non-figurative or abstract paintings. The plastic language emerges by analyzing a visual text with no regards to the recognition of the objects of the world (figurative language), but to its internal structure as a set of pure visible elements: shapes (the *eidetic* dimension), tones (the *chromatic* dimension), and relationships (the *topological* one, the disposition of the elements) – A conception strongly indebted to the phenomenological notion of “pure-visibility” (Husserl, Merleau-Ponty); namely, the conception of the visual matter of a given work of art as something completely autonomous from the visual dimension of the tangible reality.

The plastic dimension displays a “semi-symbolic” mode of signification, ascribable to “partial correlations between the two levels of signifier and signified”; which means that the “conformity between their two levels of language [...] is recognized not between isolated elements, as with symbolic semiotics, but between categories” (Greimas 1989: 645). In Western cultures, for instance, the colour black does not stand for “death” on its own, but because the whole chromatic category – “dark vs. light” – is being invested of such an oppositional connotation; black stands for “death” because white stands for “life”, and *vice versa*.

Since the plastic is a transversal dimension, applicable to any matter of expression (including the domain of food and taste, cf. Marrone 2013), it is possible to identify a series of sound-specific plastic categories, as an equivalent to those identified with regard to the visual texts (cf. Ferraro 2007).

Such perspective has been employed as the theoretical foundation to two – very – different

semiotic projects, both brilliant and, unfortunately, available in Italian only, at the moment: Valle's (2004) and Jacoviello's (2012). I will briefly discuss the latter case.

Jacoviello's model is highly refined and articulated, being exquisitely consistent with the epistemic perspective of structuralism, and it is impossible to me here to resume it without – literally – mutilating it. But, in short: the sonic contrasts established at the plastic level of sound (e.g., low vs. high, quite vs. loud, short vs. long, percussive vs. friction, bright vs. dark), which are identified not via the score, but via direct listening (Jacoviello chooses a *sonic ontology* of the musical work), are both syntactic and semantic (they are meaningless, but still they already establish differences of *potential meaning*). Such contrasts (Fig. 1) constitute the basis of an autonomous mechanism of signification, which is not static, since it does not convey a meaning which is given “for once and for all” to the listener, but dynamic, processual, and autopoietic – The meaning *in-the-listening*. At the heart of Jacoviello's model we find the “figural device” or “figural knot” (my trans.; *plesso figurale* in It.), namely the semiotic place wherein the plastic elements get their first traces of figurativity, yet without being substantialized, still being synergetic, synaesthetic, and multimodal – Intersemiotic, in just one word.

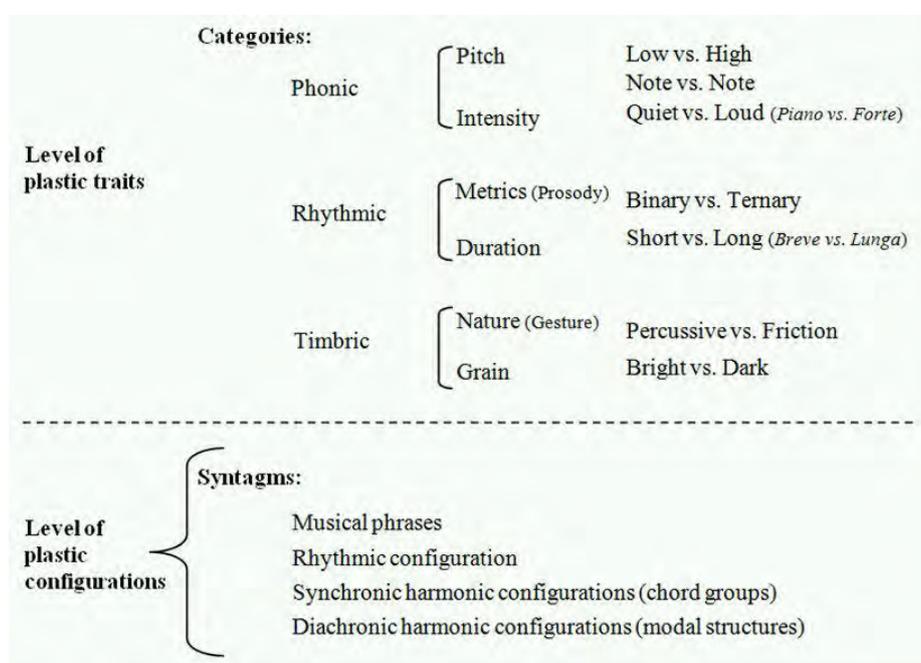

Figure 1. Jacoviello's model for the plan of musical expression: the plastic level (2012: 220; my trans. and brackets).

Here you can find an attempt of a synthesis of the model:

A. Plastic level: Selection of the categorical traits (phonic, rhythmic, timbric) and of the configurations of possible traits (phrases, rhythmic configurations, synchronic harmonic configurations – namely chords –, and diachronic ones – namely modes –) on the plan of expression. The contrasts between traits and configurations constitute the plastic level proper of the musical text.

B. Figural level: The differential relationships between traits and configurations define a grammar and, at the same time, a syntax of potential forms of the content, of forms of the content-to-be. Thus, a “transparent” syntactic-semantic structure is being established: the figural knot.

C. Discursive level: The figural knot is a syncretic and synaesthetic collector, being connect-

ed to the diverse semiotic domains at play (e.g., voice and music, in the genre of Opera). Such domains can be synergic or polemic one to the other; namely, they do not necessarily convey the very same meaning (e.g., the case with a song featuring a “happy” music, but “sad” lyrics). The objects of the external world start to emerge from the figural knot before and beyond their precise, specific iconic content. The investment of value of figural density is a process which is all internal to the differential and processual logic of the musical text, without any reference to any external, pre-constituted musical nor cultural form.

To one who is familiar with the structural-generative tradition, and who has already experienced the efficacy of plastic semiotics with regard to visual texts, Jacoviello’s model sounds like a Columbus’ egg: A very refreshing, logical, and “natural” solution to many epistemological and theoretical problems affecting the discipline in its confrontation with sound and music (although it is not an easy job to be accomplished at all, as regards the concrete analysis of a single piece of music).

5. Bonus track: Sampling, remixing, and remaking semiotics itself

With a focus on the – actual or potential – mediated nature of any post-1877 music (the year Edison invented the phonograph), I myself have tried to develop the model further (Marino 2015). I have added a proper topological *category* to the paradigm of the sonic plastic ones indicated by Jacoviello (recovering it from the original Greimassian proposal); I have elaborated a basic theory for the *phonographic enunciation* (which I will briefly, and partially, discuss here); a model for the *musical figures* (recovering the Taggian notion of “museme”, and connecting it to Gibson’s “affordance”); and a theory for the *musical competence* (heavily drawing inspiration from Stefani’s).

I recovered the enunciation theory as re-elaborated by Metz with regard to film (1991), and the consequent semiotic debate (Fontanille, Odin, Casetti, Eugeni), integrating it with the narratological categories proposed by Genette (1972; Eng. trans. 1980). By recovering Metz’s “impersonal enunciation” (an enunciation meant not to be anthropomorphic nor deictic, but meta-discursive and self-referencing), it is possible to consider the acousmatic sound as producing a kind of “phonographic shot”, within which it is possible to employ the narratological categories elaborated with regard to literature and films – Not only the category of *voice* (time of narration, diegetic level, and persona), but also that of *mode* (the *distance*, or the issue of “playing vs. making-you-listen”, and the *perspective*, or the issue of the “point of listening” or “aural focalization”, in our case).

I have recovered from Metz’s filmic theory also the distinction between “prosonic materials” (natural sound, which can be recorded and manipulated) and “phonographic language” (sound effects and manipulated sound). It is possible to distinguish between an “aesthetics of recorded sound” (a past sonic event has been recorded and is being re-presentified – made present again – via the recording) and an “aesthetics of acousmatic sound” (a kind of music that does not want to be perceived as the account of something already happened, but that occurs, that happens, live, just when the sound comes out from the speakers or through the headphones). By adapting a typology elaborated by Casetti (1986), originally concerning filmic language, I ended up in proposing a four-folded typology of enunciation modes for mediated or phonographic music:

A. Objective shot: I – the phonographic shot – present myself to you, listener, as the account of sonic events that have occurred in a past moment (pretending to be a transparent glass, I am the faithful recording of that thing). This fits the aesthetics of recorded music, with a strong prominence of prosonic materials.

B. Direct interpellation: I – the phonographic shot – present myself to you, listener, “through the looking glass”, and I “talk” to you (just like in the “apostrophe to the Reader” or in a voice-

over segment of a movie) thanks to the lyrics or “telling you about some other music” (all the degrees of intertextuality). This is a kind of enunciated enunciation on the plan of prosonic materials (typically, within a “recorded music” situation).

C. Subjective shot: I – the phonographic shot – present myself “on this side of the mirror”, being a sonic event that occurs, that happens here and now, admitting you, listener, in the world of sounds *as such*. This fits the aesthetics of acousmatic music (prominence of phonographic material; so-called Schaefferian “reduced listening”). As regards the passages of concrete music inserted into Pink Floyd’s *Alan’s Pyschedelic Breakfast (Atom Heart Mother, 1970)*, Spaziante (2009: 288) talks of a kind of “sonic subjective shot” (my trans.).

D. Unreal objective shot: I – the phonographic shot – present myself to you, listener, as the result of a process of recording, as acousmatic music *in-the-making*; namely, I show you myself “in the mirror”, displaying all my internal mechanisms of functioning, the difference, the friction between prosonic (natural sounds, recorded) and phonographic (manipulated sounds). This is a form of enunciated enunciation on the plan of phonographic materials. As regards the “radio-switch” effects featured in the songs produced by Uwe Schimidt/Atom Heart under the moniker Señor Coconut y su Conjunto (with particular reference to the record *El Baile Alemàn, 2000*), Spaziante (2007: 57-58) talks of “meta-music”, “sonic mise en abyme”, and “trompe-l’oreille”.

The typology is highly perfectible but, still, it is a good starting point. And it just came out from a *bricoleuse* scrutiny of our generous literature.

6. Outro

In this short essay, I just wanted to show that our tradition, the tradition of semiotics, is so rich to the extent that it has not been fully explored and employed yet, being fertile and up-to-date. On the one hand, we do have to be always “scientifically awake” but, on the other, we do not need to constantly be in the wake of the latest scientific discovery. We do not need, say, to import “mirror neurons” from neo-cognitive, positivist, and ontological approaches into our field, squeezing them into our epistemology, in order to go further with our job as semioticians. The fact that we know how our brain works (at least, better than some years ago, and constantly getting a more and more precise picture) does not exhaust our horizon of research and our search for meaning at all – It may be just a point of departure, not our final destination.

7. Credits: Acknowledgments

The Author would like to thank Kristian Bankov, Eero Tarasti, and Stefano Jacoviello.

ARTICULATION AS MUSICAL DIMENSION OF TEXT. THE RELATION BETWEEN WORD AND MUSIC IN SALVATORE SCIARRINO'S WORK

Julia Ponzio

University of Bari Aldo Moro, Italy
juliaponzio@hotmail.com

Abstract

I will start from the definition of Rhythm given by Benveniste in *Problems in general linguistics*, when he links the etymology of the word *rythmos* with the Greek word *Rein*, which has not to do with the division of time or with the scansion of time in equal parts, but rather with the concept of schema, of form. But *Rythmos*, says Benveniste, means the form in a particular sense because it does not mean the form as something fixed, realized. *Rythmos* means the form in the moment of its formation, that is to say the form in the moment in which it takes form. The image with which Benveniste explains this particular way to intend the form, is the one of waves: their form is inconstant, always in change, always different in itself. I will use this idea of rhythm in order to elaborate a semiotic analysis of "madrigalism". Madrigalism is an interesting case of interweaving between music, word and writing, because by madrigalisms musical writing tries to graphically mime or describe the meaning of words. Madrigalism is semiotically very complex: in it the relation between music and word cannot be thought as a classical relation between signifier and signified because madrigalism does not work *in absentia*, it does not mean word if the word is not there, present, visible near it. If in a musical text which contains madrigalisms the singed text is erased or lost, madrigalism disappears, it does not remain as signifier which makes reference to an absent signified. Madrigalism works in presence, in the moment of the encounter between word and music. It can be described as a grafting, as a montage. I will try to reflect on this operation of grating, on this particular encounter between music writing and word, through Benveniste's idea of rhythm, starting from a piece that in the contemporaneity uses and problematizes the idea of madrigalism, which is Sciarrino's *12 madrigali per voci a cappella su haiku giapponesi*.

Musical form of Madrigal is a very good starting point for an analysis of the complex relation between musical sign and verbal sign.

In this paper I try to analyse this relation, in order to highlight, starting from it, an idea of *rhythm* which displaces the pivot of semiotic analysis from a semantic ground to a merely syntactic ground.

In this text I will speak of madrigal starting from a contemporary work, which is Salvatore Sciarrino's *12 madrigali per voci a cappella su haiku giapponesi (twelve madrigal for voice a cappella on Japanese haikus)*, presented to the Salzburg festival in 2008.

The use of the musical form of madrigal and the poetic form of haiku is not new in the work of this composer, but Sciarrino uses this two forms together for the first time in this work.

Sciarrino explains in 2008 that his interest in madrigal is linked to a particular relation between word and music it inaugurates in Western music history (Sciarrino 2008). This relation has to do with the abandonment of the strophic structure of music, that is to say, with the abandonment of a composition practice of a musical text, which is indifferently adaptable to every stanza of a poetic text, or even to every poetic text with a certain metric structure. "Arie per cantar sonetti" or "arie per cantar stanze di canzone", for example, are texts adaptable to every sonnet or every canzone. Madrigal represents, therefore, the end of an indifferent relation between text and music. The musical text of a madrigal is indissolubly linked with a verbal text: it establishes between text and music a relation in which no substitution is possible. In a madrigal, every single part of the text has its own proper musical phrase. Madrigal, therefore, situates the place of the relation between musical and verbal text, in the sense of the "proper", but in such a particular way that this relation deeply changes the sense of this proper, the sense of belonging, the sense of property.

Answering the question why he calls Madrigals some pieces which have not the formal structure of the madrigal as a form historically codified, Sciarrino says:

Because they are for ensemble of voices, because they have some links, though weak, with that world. And they have even some madrigalism, that is to say they express the will to represent a precise concept by a melodic figuration or by other types of figurations. Something like this also appears in this work. For example in one of the madrigals something rhythmically very clear appears when the word "rhythm" is sung. Madrigalism is a technique linked with the voice because it is linked with the meaning of words (Sciarrino 2008).

In his answer Sciarrino speaks about madrigalism, which is a composition procedure in which music follows words not only from the point of view of expressivity, but also from a graphic point of view. In other words, in a madrigalism the graphic notation of music mimes the meaning of the word linked with it (as for example the word "eyes" represented from two whole notes, or the correspondence between the word "see" with a graphic movement of the notes on the pentagram, which recalls the movement of waves).

How can we semiotically define the relation established between word and music by madrigalism? What sort of link is the one, which connects, for instance, two whole notes with the word "eyes"? It is very difficult to frame the relation established by madrigalism between word and music, in the terms of a classic relation between signifier and signified. It is difficult because madrigalism does not work in absentia. Madrigalism doesn't work as a sign which stands for a word, if the word is absent: its iconic relation with word appears only if the word

is present, only in the moment in which the presence of the word establishes and marks a relation with the music. If in a musical text, which contains madrigalisms, we erase the line of the voice, madrigalisms disappear. The verbal text cannot be reconstructed starting from the graphic resemblance with the musical text of madrigalism. In a madrigalism, once the verbal text is erased, does not remain any signified, any reference to an absent signifier. The musical text in the case of madrigalism, far from verbal text, does not work as a code whose system of codification is lost. Madrigalism works in presence, in the moment of the encounter between word and music: it is a graft, an assembling operation, a montage.

It is very interesting that Sciarrino quotes in the interview of 2008, as example of a madrigalism used in *Dodici madrigali*, the madrigalism on the word Rhythm: “something rhythmically very clear appears when the word rhythm is singed” (Sciarrino 2008). I will connect here this madrigalism on the word rhythm, quoted by Sciarrino, with the definition of rhythm given by Benveniste in an appendix of *Problems of general linguistics* (Benveniste 1971: 281-288). In its ancient meaning, according to Benveniste, the word *rythmos* did not mean an ordered sequence in the duration of events or movements, the scansion of the march that controls time dividing it in equal and countable parts. The etymology of *rythmos* comes from rein, which means to flow (as a river). In its ancient meaning, Benveniste says, *rythmos* has something to do with the concept of schema, of form. But while schema is defined as a fixed, realised form, as something posed as an object, *rythmos* defines the form in the moment in which it is assumed: it is the mobile, fluid form, it is the improvised, momentary, modifiable form. This idea of rhythm configures an idea of time totally different from the one of a simple series of instants on a line. Rhythm is a relation, is the moment of the encounter in which nothing remains the same. Rhythm means a not originally relation, a relation which does not come from a past, which is not ratified by a convention, which does not come from a process of recognition. Rhythmos defines a relation, an encounter between elements which, coming in contact, begin to belong to each other, without any possibility to justify their relation. It defines a relation that does not unify. For these reasons, the text that enters in this relation can work otherwise if this relation is interrupted. Far from its verbal text, a musical text which contained madrigalisms, played with instrument, for example, continues to fully work, as if nothing is missing: it continues to signify otherwise. Madrigalism establishes a relation between world and music in which the concept itself of property, of belonging, is deeply modified. In this relation “proper” and appropriate does not coincide, like in Heidegger’s idea of *Eigentlichkeit*. This alteration of the idea of proper, makes the relation unstable and always about to change. The elements which constitute the form of madrigalism, once separated, does not refer to each other in absence, but begin to signify otherwise. Rhythmos in Benveniste’s sense, indicates therefore both a relation and a fissure, that is to say it indicates a relation, which does not close a circle but which, on the contrary, opens a space. Rhythm is in this sense articulation. The relation between word and music which madrigal constitutes, implies therefore this alteration of the idea of proper which let us think rhythm as *articulation*. Articulation is a fundamental element in the execution of musical text, it is what let the musical text to breath, what differentiates human musical execution from the one of an electronic device.

To the interviewer who asks why in *Dodici madrigali* he uses so a historically codified form as the madrigal, Sciarrino answers: “Actually I’m not looking for a relation with tradition, but for a new form of creation” (Sciarrino, 2008).

The reference to the *form* of madrigal, in Sciarrino’s work, is therefore a reference not to the form as *schema*, that is the form once immobilized from tradition and history, but a reference to the *form* as rhythm, to the form as *figure*. Differently from madrigal, in a strophic musical composition, what is important is the metre of poetical composition. Therefore in a strophic

musical composition, rhythm is intended in the sense of the schema. Rhythm in the sense of schema is linked with the traditional idea of a linear time, the time of *distension animi* which is the time of narration: Augustine, for example, in *Confessions* uses a metric structure, that is to say a schema of alternation between short and long syllables in a verse (*Deus creator omnium*) in order to build his idea of time.

On the contrary, rhythm in the sense of *form in the instant of its formation*, does not have a horizontal direction, as the classic idea of time, but it has rather a vertical direction. This idea of time has more to do with the instant of the encounter than with a narration of the encounter, which justifies the encounter itself, analysing the reasons of the being together.

The form of madrigal to which Sciarrino makes reference, is therefore the form of a relation between word and music, which is not justified by a schematic correspondence. This relation does not allow any possibility of substitution, but, at the same time, it establishes a link which counts for the encounter, and that therefore does not work in absence, thereby opening the possibility of new encounters, as in the case in which the verbal text is set to music again, or the musical text transcribed otherwise.

The madrigalism on the word rhythm, produces therefore a double madrigalism: the music graphically mimes a word, but doing so it graphically also mimes the form itself of madrigal, that is to say the structure, the form of the rhythmic relation it introduces between word and music. Rhythmic relation is a fissured, articulated relation, in which there is always the space for a breath, for an embellishment, for a fioritura, for a diminution.

The core of Sciarrino's work on madrigal is the question of the space between musical and verbal text, and in particular the question of the strange temporality and the strange property relation that madrigal constitutes.

Madrigalism, which reveals the rhythmic structure constituted by madrigal between text and music, also lets emerge the place in which this rhythmic structure is constituted. Madrigalism is a graphic mimesis in which musical writing mimes the meaning of the word to which it corresponds. It is totally not important, if this mimesis, this resemblance, is perceptible for a listener who listens to the music without the score.

Madrigalism lets appear, therefore, a relation between text and music at the level of writing. The vertical or instantaneous temporality, the rhythmic relation, concerns musical *writing*.

Sciarrino writes in *Le figure della musica*

[Writing music] means to use symbolic-graphic systems, that is to say to use systems developed and ordered in the space. This implies the use of logical and spatial structures. Musical writing offers the possibility to *fix*, to control, to project in a simultaneous reading what in the time we hear, on the contrary, as a succession". (Sciarrino 1998: 123)".

Musical writing, Sciarrino says, confers to the music an architectural sense. What happens to the poetic text, to its temporality when it comes in contact with this architectural structure? If musical text is a fissured, articulated time, where the spaces between sounds always open the possibility for breath and fioritura, the insertion of the verbal text multiplies the spaces, thereby projecting the text in a tridimensional structure. The rhythmic relation which madrigal establishes between music and word, as is evident in limit case of madrigalism, is also projected inside verbal text, deeply changing it. In this projection, the syntactic dimension exceeds the semantic dimension, and the vertical instantaneous temporality gets the upper hand over the time of narration.

This complex process by which the encounter between music and verbal text modifies the

temporal structure of verbal text is very clear, for example, in Sciarrino's musical theatre. The wiring of opera, of melodrama is traditionally linked to the narration of a tale. In Sciarrino's musical theatre, on the contrary, time never flows because all happens in only one instant. As for example in *Lohengrin*, composed in 1983, which is significantly subtitled: *invisible action in a prologue, four scenes and one epilogue*. This text, presents an apparent action –the love story between Elsa and Lohengrin- apparent because at the end it is revealed to be only a dream, or a delirium of Elsa, confined in a psychiatric hospital. The time of the action, therefore, is at the end contracted in the closed and narrow space of a hospital's room.

This contraction of the narrative aspect of the text, this passage from a horizontal-narrative temporality to a vertical-instantaneous temporality, is what conducts Sciarrino toward a particular type of poetic text, which is Japanese haiku. In *12 madrigali*, Sciarrino produces an interesting encounter between the form –the rhythm- of madrigal and the form –the rhythm- of haiku.

With reference to another of his works, *Quaderno di strada* (2005), Sciarrino describes very precisely how he works on a verbal text before setting it to music. Verbal text, Sciarrino says, has to be adapted in order to be set in music. This adaptation process is described as an operation that has to do with cuts, with eliminations of parts of the text. In *Quaderno di strada*, Sciarrino sets to music some fragments, as for example graffiti read on cities walls, part of letters or articles or poem's lines, collected in different moments and places on a notebook. For each text is indicated the author, or the original collocation, but they result profoundly modified because parts of them are cut. Sciarrino describes this modification of the text as a process, which reduces the text to something that is very similar to the structure of haiku.

Sciarrino writes:

The verbal flash of haiku, inserted in longer musical piece, let the verses rotate on themselves, so that the sense is subverted. Every word enters in contact with another one, also if it is very far, thereby creating new images, short-circuits (Sciarrino, 2008a: 26).

Roland Barthes, in the last years of his life, in *La preparation du roman* (Barthes 2011), deeply works on Japanese haikus.

In this text Barthes describes haiku as exemplar act of annotation of present that is to say as writing of the instant, of the event (Barthes 2011: 23 and following). Annotation, of which haiku is an exemplar act, consists in the extrapolation of a single experience from the whole flowing of experiences. In this notation practice, writing gives to the experience a *form* –form in the sense of rhythm and not in the sense of schema. This form is the form of the event. Haiku is an annotation that shares with musical notation the fact it determines a vertical relation between the lines of the text, rather than a horizontal narrative structure. A “good” haiku, Barthes says, does not tell a story and does not *express* a concept. The space between the lines of a haiku, according to Barthes, is empty: in it we can't find any logical or temporal connection, but nevertheless these lines are not indifferent to each other. The lines are at the same time both linked and separated by white spaces that constitute a relation that both Barthes and Sciarrino describe as a *short-circuit*, or a *tilt*. What Barthes describes as short-circuit or tilt is a double rhythmic relation: the first between the subject and the object of writing, and the second between the lines of the poem. A haiku is in this sense the result of an encounter, which does not happen to a transcendental subject, to a subject in general: a haiku is the result of an encounter between singularities. What happens in this encounter, according to Barthes, is an individuation event (Barthes, 2011:

39). Individuation is the event of an encounter, it is a window opened between two universes, which determines what Barthes, with a very musical word, calls *nuance*. *Nuance* is what makes something or someone irreplaceable in a relation. Nuance is an encounter between singularities whose link is circumstantial: it realizes a montage of universes which give sense to each other also if they are not made for each other. Nuance realises a link that cannot justify itself, in other words it realises a not schematic form, a fluid form, a rhythm. For these reasons, this link, as in the case of madrigalism, does not work in absentia. It is lost once the encounter is finished. And this loss is an irreparable loss.

The space between the three lines of a haiku is empty, it is a silence, as the space between two notes of a musical composition, or the space of the two lines of a counterpoint, or the space between the line which indicates the melody to sing and the line which indicates the word to pronounce.

To reduce a text to a haiku means therefore to dig in it spaces in order to make articulation emerge. Articulation is according to Sciarrino what makes possible to set a verbal text to music. Articulation is therefore, in Sciarrino, the place of the encounter between word and music.

Sciarrino writes:

The mysterious and powerful link between sound and word. Word and sound, sound and word: this is singing. To invent a song does not mean only composing for a voice. Is necessary before composing, to clean our minds, to make transparent the intervals which have been crossed by all the music of the world, by mountains of songs, and by what constitutes the gigantic rubbish dump in which we live. Ecology is the birth of a consciousness in order to act and to find again ourselves. Therefore ecology of sound means coming back to silence, but above all to find again an expression without dryness and without rhetoric. When the voice trusts to silence, it remains only mouth, hole, saliva. Slightly opened lips, border of a obscure void, border of thirst and hunger (Sciarrino 2008: 27).

In order to compose for voice is necessary, according to Sciarrino, to find silence, or better a particular form of silence. When Sciarrino speaks about silence as the possibility of the mysterious and powerful link between word and sound, he is not speaking of an absolute silence but rather of the silence opened between the sounds and the words that is the silence which articulates creating a relation and making transparent the intervals. When voice trusts to silence, Sciarrino says, it remains only mouth: not a mouth closed in an absolute silence, but on the contrary a mouth with disclosed lips, as the lips of someone who is about to speak or to sing. This silence with disclosed lips is already articulating a form. This particular sense of articulation is described by Sciarrino in *Le figure della musica*, by what he calls *window forms* (Sciarrino 1998: 97), where again "form" has to be intended as rhythm and not as schema. In window forms, a rip opens an universe on another universe, breaking continuity. Exactly as it happens in *Lohengrin*: in the narrow space of a hospital room a window is opened on a dream. The prologue of this work is titled: *prologue through an opened window*. A universe is opened on another universe without a narrative link: between Elsa's real situation and her dream, there is no coherence, no narrative flow, no linear time. Is exactly as, Sciarrino says, when we open more than a window on our computer desktop.

The window form, Sciarrino says, is a montage, a seam whose scar remains evident, made of two universes that, on one hand, are not made to be together and, on the other hand, from the moment of their encounter on, are not indifferent to each other. It is an instantaneous montage,

as the one of photography. Windows, Sciarrino says, are two spatial forms cut in time. What Sciarrino calls window form, is a relation between two universes, which lean toward each other in a reciprocal donation of sense. This relation of sewing, of montage, determines, according to Sciarrino, a totally discontinuous time, an articulated time. In this articulation realized by window forms, music is already in relation with word, also if the text is still not been set to music.

Sciarrino experiments this idea of a relation between music and text, which goes beyond the simple act to set a text to music, in many pieces, for example in *Alfabeto oscuro*, composed in 1993 which is a part of *Musiche per Dante*. This piece, written for a little orchestra, therefore without voices, has at its beginning, as indication for its execution: “come parlando” which means “like speaking”. The effect of *come parlando*, is obtained, in this piece, by the pronunciation in the instruments of the consonants of the *Divina commedia*’s first verse. Consonants produce a cut, an articulation effect, an effect of continuous traumatic interruption. Therefore the *come parlando* mimes articulation, the syntactic relation, the rhythmic relation of words. In this rhythmic relation Sciarrino finds an eloquence before word which is the link which connects word and music before the operation to set to music a text: the eloquence of instruments in *Alfabeto oscuro*, Sciarrino says, is given precisely from the impossibility to speak.

Musical dimension of text, that is to say what makes possible the encounter between word and music, is therefore this articulation, in which writing goes beyond narration and becomes position of signifiers. In this writing as position of signifiers, which constitutes the musical dimension of text, the link between signifiers has no more to do with the semantic reference to their signified, but it has rather to do with rhythm, that is to say with the circumstantial movement in which signifiers enter in relation, through silence spaces, opened as windows on other interpretative universes.

ANDREI TARKOVSKY'S *MUSICAL OFFERING*: THE LAW OF QUOTATION

Julia Shpinitskaya
University of Helsinki, Finland
Julia.Shpinitskaya@helsinki.fi

Abstract

The article explores meaning and function of musical quotations in the films of Andrei Tarkovsky, the context of their appearance in a particular film space and their relationships with the visual images and onscreen situations. Quotation forms a vastly significant part of the new cinematic sound language that Tarkovsky was creating in his work, relating its function to the mechanisms of the *poetic logic*. Holding a multiple and variable meanings, the quotation is an open semantic space that produces a series of senses. Current observations departure from the original ideas concerning approach to the historical musical material from Tarkovsky's own notes in *Sculpturing in Time* and the interviews of his musical collaborators (composer Eduard Artemiev and sound-mixer Owe Svensson), which are extended by findings made in case studies.

1. The law of quotation

Starting from his third film, *Solaris*, Andrei Tarkovsky practically expelled regular film music from cinema and did not make a film featuring a regular music track. Instead, he aimed at exploring new relationship of sound and image and foundation of new expressive senses as if the new genre has not created its own visual and audio language as he thought of cinema. Ideally he was thinking about a film with no music at all. The sounding was purposed to reach a realistic soundscape: absence of film music was compensated for by electronic music, a new sound in 1970s, often disguised as organic sounds, purified of their origins on the director's demand, as well as by natural sounds and urban noises. And even his ideal model of a composer was a "sound-mixer with composer's hearing", an expert in rustles, rumbles and echoes, as mentioned by Eduard Artemiev (Petrov 1996), the composer whom he worked with on majority of his

films. On this path of achieving natural sounding Tarkovsky escaped into another music realm – quotations, which appear almost in every film¹, even in abundance. Andrei Tarkovsky's only *Musical Offering* is exclusively musical quotations, and they become a rule of a film.

Emergence of a real musical piece, a quotation, in the context of natural and electronic sounds and noises within a film, is justified by its semantic value. It takes music to the symbolical level, calling to the particularity of the moment. Some quotations serve as refrains, repeated in a film, and besides sometimes they are transferred from film to film. However, not only art-music of classical heritage can be taken as quotations in Tarkovsky's films, but a pre-existent musical material in a broad sense serves as quotation as well whether it is a Russian folk song, forest herding calls from Sweden, or a traditional Japanese flute performance. The function of this musical material in the films is identical with the function of classical quotations: it marks film episodes as key points. After *Solaris* Tarkovsky applies the newly discovered strategy of quotation again and again, on a regular basis, and in the meantime he approaches entrance of the quotations in divergent modes, attempting to mask them in a film and blend with other sound content. Above all, the appearance of the quotations in general in the film space is greatly intriguing, not to say that the case of emergence of one or another specific quotation in particular is arresting, and therefore, a film moment shared and highlighted by a musical quotation is inviting to understand the strategy of quoting, the meaning and function of quotation, or the aspects of quotation that become activated for interaction with the film body.

2. Levitation scene

I would like to start with a quotation confluence in *The Sacrifice*: two musical quotations that are solved as a polyphonic sound space². There is a series of images that depart from a real event, but followed by surreal episodes until it ends in awakening from sleep. Both audio and visual channels support ambiguity of the event and leave unresolved whether it is a dream, vision or reality. This is a central scene of the film, the sacrifice per se. The course of events suggests that Alexander comes to Maria for a sacrifice, a love ritual. Before, Otto reveals to him that Maria is a witch and that Alexander must go and persuade her to love him: it is likely the only way to rescue the world from the upcoming war.

There are two musical elements involved into this series of episodes as a pre-existent material: Japanese bamboo flute *hotchiku* played by Zen master Watazumido Shuso and traditional Swedish forest calls to call home livestock, a recording by Swedish Radio in the countryside. They start during Alexander's visit to Maria and interweave over a series of images. The sounds enter during the levitation, which represents love and make a counterpoint. Correspondence of the quotations is well determined. The flute defines personality of Alexander, while the calls are a token of Maria. Sound works as a representation of a personage. The calls and flute appear in the film many times but before the levitation they do not come together. The *hotchiku* sound is bound to the image of Alexander, fascinated by Japan: planting a Japanese tree, listening to Japanese music, wearing a kimono, and supposing that in his previous life he and his little son were Japanese. The calls are, most likely, the only representation of mysteriousness of Maria. These are not only typical sounds of Swedish countryside but they obtain real sense of signals and their true destination is to call. Owe Svensson, the Sound Mixer, who worked in *The Sacrifice* interprets this sound in its relation to Maria:

The important thing was that there was this woman and she comes into the film quite early and then she enters the dream and that represents a connection with human emotions, which of course a contrast to the threat of war. Both Otto – the actor Allan Edwall – and

Alexander are in contact with her. Otto seems to receive her call when he suddenly collapses on the floor while walking through the house telling strange tales (Sundström).

The scene preceding Alexander's visit to Maria drops a clue about the calls, too. Otto tells about Maria's magic power insisting that Alexander must go to her. In this moment a single call is heard and both of them receive the signal:

Otto: Have you heard?

Alexander: What?

Otto: What is it?

Alexander: I don't know. I seemed that there was music.

Then Alexander escapes to Maria's dwelling³ – the sequence starts as an actual event. The interaction of the flute and calls endures through next scenes and after that Alexander wakes up at home. Thus, the matter is resolved in favour of a dream but the question remains open: it is unclear whether everything was a dream or dream was only a part of the sequence, and when the reality deviated into a dream.

3. List of quotations

Before venturing into a discussion on the meaning and function of quotation, let us overview the long list of works explored in Tarkovsky's films.

- *Ivan's Childhood*:
A Russian folk song⁴ anticipating the quotation strategy.
- There is an only quotation in *Solaris* but it returns four times.
Bach's Choral prelude in f-minor, *Ich ruf' zu Dir, Herr Jesu Christ* (*I call to you, Lord Jesus Christ*) BWV Anh. 73-2.58, a variant of the famous prelude BWV 639 from the *Little Organ Book* of W. F. Bach.
- Five quotations in *The Mirror*:
J. S. Bach, *Das alte Jahre vergangen ist* (*The Old Year...*), from *Orgelbüchlein* BWV 614. Refrain, sounds twice.
G. B. Pergolesi, *Quando corpus* (*When the Body...*) from *Stabat Mater*.
H. Purcell, song *They Tell Us That Your Mighty Powers* from the opera *Indian Queen*, Act 4. Refrain, sounds twice.
J. S. Bach, Recitative of Evangelist *Und siehe da, der Vorhang im Tempel* (*And Behold, the Veil of the Temple...*) from *Johannespassion* BWV 245.
J. S. Bach, Choir *Herr, unser Herrscher, dessen Ruhm* (*Lord, Our Redeemer, Thou Whose Name [in All the World is Glorious...]*) from *Johannespassion* BWV 245.
- Four quotations in *Stalker*, with a distinct technique of setting them in film:
J. S. Bach, Aria of alto *Erbarme dich, mein Gott* (*Have Mercy, My God, [for My Tears' Sake...]*) from *Matthäuspasion* BWV 244, Part two. Appears in a short whistling.
R. Wagner, theme of sacred love from the *Overture to Tannhäuser*.
M. Ravel, *Boléro*.
L. van Beethoven, *Ode to Joy* from *The 9th Symphony*. The three latter quotations come out of train noise. The theme of the *Ode* also sounds in *Nostalghia*, twice.

- Three quotations in *Nostalghia*, two of them sound twice:
G. Verdi, *Libera me* from *Requiem Aeternam, Requiem*. Refrain, sounds twice.
L. van Beethoven, *Finale of The 9th Symphony*: Refrain, it sounds twice. (And in *Stalker* once).
A Russian folk song sang by the Writer (*There Somebody Walked down the Hill*).
- Four quotations in *The Sacrifice*:
J. S. Bach, Aria of alto *Erbarme dich, mein Gott* (*Have Mercy, My God, [for My Tears' Sake...]*) from *Matthäuspasion* BWV 244, Part two. Refrain, it sounds twice. And it also sounds in *Stalker* as a short motive.
Traditional calls, chants from Swedish forests to call home livestock. It sounds many times.
Japanese bamboo flute hotchiku performed by Watazumido Shuso. It sounds many times.
J. S. Bach, *Prelude* from *Praeludium et Fuga in d* BWV 539. The beginning of the *Prelude* is performed on organ by the main character.

There one would reveal a large tribute to Bach and Baroque music and a portion of Romanticism in later *Stalker* and *Nostalghia*, including application of quotations from Verdi and Beethoven as refrains. He retains a short Bach's motive together with the romantic quotations in *Stalker*, but the mode of quoting Bach differs from quoting other music in this film. *Stalker* is quite unique in Tarkovsky's filmic sound technique, being the closest to his declaration of not having music. The mode of quoting has passed a strong modification: quotations are well-concealed, masked from being evident: the Bach's motive appears in passing, in a whistling, while other quotations reach one's ears from behind the train noise. Later he returns to a straighter quoting and a more open appearance of historical music.

4. The meaning of quotation

Attempting to approach the meaning and function of musical quotation one would inevitably find oneself wandering about in a labyrinth of sense. The meaning of quotations is unresolved, and while there is much to think that quotations function as metaphors, Tarkovsky himself rejected this meaning. Therefore, to investigate the function of quotation is to explore his reasons to quote. And the starting point on this path could be the meaning of the key notion in Tarkovsky's film aesthetics, the *poetic logic*.

4.1. Poetic logic

In *Sculpturing in Time* the film director introduces his strategy of quotation and relations between quotations and filmed images as poetic logic and poetic links (Tarkovsky 2002: 111–114, 123–125). Poetry for him is a specific attitude to reality, a way of life, and the poetic links bring emotionality to what is seen on screen. The poetic logic is an art of associations that shift from one object to another. It is the building principle of memories and dreams, however it also represents patterns of thinking and thus the ordinary reception of reality. The link between quotation and another object – a filmed image, quotation, or visualisation – opens by association.

Tarkovsky thought that the poetic logic is an approach to a more realistic cinema: he relates it to the attributes of human memory and distinguishes that some phenomena, like dreams and recollections, could not be represented otherwise than by means of the *poetry*. He applies the associative thinking to represent man's personality through memories and dreams: once he refers to Proust's idea of reviving "a huge building of recollections" (Tarkovsky 2002: 158). Another time he says: "I wanted to demonstrate possibilities of cinema observing life, sort of, without gross apparent interference in its course. Because this is the way I see the authentic *poetic* essence of the cinematography" (Tarkovsky 2002: 315–316)⁵.

4.2. Building emotional ties

While emotionality is mentioned as one of the effects resulted from the poetic logic, it may be one of the clues to read the essence of quotation. Musical quotation is tied to the filmed image by emotion: thus, once, Tarkovsky determines that the western tradition speaks from the emotional and personal viewpoint, full of subjectivity and a strong self:

Compare eastern and western music. West shouts 'It is I! Look at me! Listen how I suffer, how I love! How unhappy I am, how fidgety! I! My! To me! Me!' East keeps quiet about itself! A total dissolution in God, Nature, Time. To find yourself in everything! To hide everything in you! The Taoist music. China of 600 years before Christ (Tarkovsky 2002: 348).

The quotation is an emotion that a viewer may share when at the same time observing an image. Also that emotion may be connected to the inner state of a character since Tarkovsky clearly recognises that he wants to show the inner world of a man:

I was not interested in surface movement, intrigue, content of events – from film to film I needed them less and less. I have always been interested in the inner world of a man – and it was far natural for me to make a trip inside his psychology, feeding it philosophy, those literary and cultural traditions, on which his spiritual fundamentals are rested (Tarkovsky 2002: 324).

4.3. Establishing identity: historical roots and belongingness

One more clue is pointed out when discovering that by his search of the cinema language Tarkovsky wanted to establish historical roots of cinema and to demonstrate continuity of arts and connection of times, as mentioned by Artemiev and implied by Tarkovsky himself: "Andrei told me that he needs Baroque music and paintings of old masters in order to create an illusion of roots of this new (only a hundred years!) genre, the cinema. This is because, when a man hears Bach or sees painting of Michelangelo or Leonardo da Vinci, the 'connection of times' springs up in him subconsciously" (Petrov 1996)⁶.

In *The Mirror* I sought for communicating the feeling that Bach, and Pergolesi, and letter of Pushkin, and soldiers forcing a crossing over Sivash, and home quite small-scale events – all these in some sense are equal for human experience. It may be equally important for a man's spiritual experience what happened with him yesterday and what happened with the humankind a century ago... (Tarkovsky 2002: 314).

Besides the general timeless aspect of the cinema as a stage in the art continuum, given by the use of historical quotations, an art object quoted in a film refers to one's personal roots and creates the aspect of belonging of a man, or a character, speaking also of his personal background: "In all motion pictures that I made, the topic of roots, of connections with ancestral home, with childhood, with motherland, with Earth, has always been very important for me. It has always

been very important for me to establish one's belongingness to a tradition, culture, range of people or ideas" (Tarkovsky 2002: 314).

Quotation enters as a part of a man's universe. It speaks of a man, his community and personal world: "I am interested in the man, in whom the entire Universe is enclosed, — and in order to express the idea, the sense of man's life, it is little necessary to build some storyline on to this idea" (Tarkovsky 2002: 324).

4.4. Metaphor versus poetic logic

There was an exception once, when Tarkovsky recognised the sense of quotation as a metaphor, speaking of a particular case in *Nostalghia*:

Perhaps, I can agree that the final shot of *Nostalghia* is partially metaphorical, when I place a Russian house into the walls of an Italian cathedral. This constructed image contains a too much touch of literary effects. This is a modelled inner state of the hero, his division into two that does not let him to live as before. Or, if you will, on the contrary, his new integrity, organically including into itself, in one and indivisible sense of home and blood, hills of Tuscany and a Russian village, which the reality commands to divide on returning to Russia. [...] This is a result, as it seems to me, quite complex and ambiguous, figuratively expressing what was going on with the hero but still symbolising nothing more, extraneous, needing a solution (Tarkovsky 2002: 333–334).

On the same pages he excuses his inconsistency by saying that an artist devises a principle but also breaks it.

Nevertheless, despite Tarkovsky's theoretical constructions against the metaphorical sense of quotations, it is impossible to completely negate their metaphorical sense. The abundance of associations, references and symbolic representations supports work of metaphorisation but the sense of metaphor does not depart far from the sense of the poetic logic. It is not that the mechanism of metaphor does not belong in there. The dilemma is the borders of the notion and precision of a definition. The poetic logic covers the meaning of metaphorisation but exceeds it, richer in signification. Tarkovsky did not want his images or sounds to work in the mode of metaphors, as objects with an exact ultimate sense.

4.5. The sense of *haiku* (polysemanticism and observation)

With the poetic logic approach, in which the meaning of quotation multiplies, becoming ambiguous and polysemantic, Tarkovsky interprets the meaning of quotations akin to the principles of *haiku*, Zen or Japanese music that were points of his interests and aesthetic reference: representation of everything or nothing, either endless series of senses or nothing more than pure images in observation. The poetic logic becomes a method of *observing* an image. "What does mean, for instance, Leonardo or Bach in the functional sense? Just nothing but what they mean per se, — that much they are independent. They see the world as if for the first time, as if they were not burdened with any experience. Their independent gaze becomes similar to the gaze of newcomers" (Tarkovsky 2002: 223).

Tarkovsky's idea suggests that observing is a basic principle of the cinematographic image, and that the image is an art of posing your own sense of an object as observing the object (Tarkovsky 2002: 214–215). In the episode of weightlessness in *Solaris*, when, during Bach's *Prelude* one loses sense of temporal frames, the historical quotation represented out of actions and dialogues brings the viewer to a state of contemplation. It activates the function of the observer

that makes the viewer stand still and provokes a sort of meditation on a subject. In it there is no eventual sense of an image that could be deciphered like a charade:

Haiku grows its images in the way that they do not mean anything but themselves, at the same time expressing so much that it is impossible to catch the ultimate meaning. I.e.: the less possible fits the image of it [haiku] into a conceptual speculative formula, the more accurately the image corresponds to its destination. A man reading haiku must vanish into it like into nature, immerse in it, and be lost in its depth like in cosmos, where there is neither top nor bottom (Tarkovsky 2002: 213).

4.6. The interplay of contexts

In the labyrinth of sense signified by use of quotation it is relevant to determine that although Tarkovsky defends independency of quotations from experience, however, it is not only pure music that co-operates with the image emotionally or by means of the poetic logic and poly-semantic expression, but it is the original context of music that provides signification for the screen situation – and this is a strategy by which a quotation enters the film body. It is relevant to list a number of examples to demonstrate how this correspondence is created between the musical context and the visual context.

- Wagner's theme that introduces spiritual ideal love in *Tannhäuser*⁷, in *Stalker* is a token of feelings that connect Stalker and his wife⁸. In the opera this theme also becomes the theme of a pilgrim's choir (I act II part). The topic of pilgrimage finely refers to Stalker himself: a devotee, with a vocation to guide the unhappiest people to the Zone, he has to live ascetic life in poverty, to suffer a lot of oppression⁹, and to remain pure and unsullied.
- The quotation from *Mathew Passion* in *Stalker* is distinguished by its ironic use. *Have Mercy My God* is a cynical excuse whistled by the Writer, a disbeliever, walking through the dangerous Zone, a sacred place, with disrespect.
- However, the same theme in *The Sacrifice – Have Mercy My God* – turns to be a prayer of forgiveness that corresponds to the entire topic of sacrifice and to the circumstances of Alexander. The quotation frames the film and though it does not attend the image of Alexander, it correlates to his asking forgiveness for sins of the world and to the vow to sacrifice everything he possesses for rescuing the world from the catastrophe of the last war.
- Ravel's *Bolero* is employed in the long last scene in the Zone from *Stalker*, where three personages, Stalker, Writer and Professor, are sitting in the floor through the day before returning to the world, after the bomb to destroy the Zone has been disarmed. The link of this quotation is the topic of technical progress: as it is known, on composing *Bolero*, Ravel imagined a factory. He left enthusiastic impressions out of gigantic urban creatures associated with metal, fire, crash and rumble.
- Beethoven's *Ode to Joy* accompanies Stalker's disabled daughter when she reveals a gift of telekinesis: the triumph of spirit.
- Two cases of the same theme in *Nostalghia* may be considered as one quotation, interrupted but continued in other part of the film. They are both related to Domenico, obsessed by ideas of unity and rescue of mankind. The first sounds in a dialogue with Andrei, whom Domenico is conveying to rescue the mankind. The second marks the episode of Domenico's self-immolation preceded by his propagation on the Capitol in Rome. Both times Beethoven is played by Domenico himself for demonstration of his ideas. This musical representation restores cultural and historical reference of Domenico's statements:

“One drop and one more drop make one big drop, not two”, “At first I was an egoist. I wanted to rescue my family. But one needs to rescue all. All world”, “People have to come back to unity and not to remain separate”.

- The sense of Verdi's *Requiem* during Andrei's flashback in the beginning of the film, when he sees his family and house in Russia, is obtained in the final shots in return of the quotation at his passing away: thus, his opening memories are disclosed as a farewell.
- One of the quotations in *The Mirror* is used as a musical portrait. Purcell's song from *Indian Queen* implies the power (*They Tell Us that Your Mighty Power*) that a red-haired girl had for Alexei, back in his childhood. In both of the girl's episodic appearances Purcell's theme follows her. It reminds of the strategy of female images in his visual quotations serving a mirror of a personage.

5. Open semantic space

Musical quotation is one of Tarkovsky's sound forms used among natural sounds, noises and electronic sounding that shape the soundscape of his films; sometimes mixed or blended into those other sound forms. Whether it is historical art music of a pre-existent musical material, quotation forms a significant part of the new cinematic sound language that Tarkovsky was creating in his work and is the only part that brings conventional music into his films starting from *Solaris*.

Tracing connections between musical quotations and onscreen situations and images in the films exposes a framework of relations between them that work on several semantic levels and aim at emergence of diverse effects. The very use of quotation seems an exploration of its creative senses for the film director. Quotation represents a multifunctional strategy, holding a variable and mobile semantic space, while the meaning of quotation multiplies, producing series of senses and is not meant to be defined by precise boundaries or ultimate meaning.

The functions of quotation shift between creating identity, linking to an emotion, bringing in a metaphoric reference, entering the state of observation (as a extended moment when time freezes up), and suggesting an interplay of contexts (as the original context of the quotation and the onscreen context). The aesthetics of the poetic logic is not only responsible for emergence of quotations on screen but it is what governs the series of senses and functions produced by quotation, supporting semantic field of quotation as an active open space. Connections between the filmed reality and quotation or between quotation and quotation open by association in the likeness of memories evoked by smell of madeleine for Proust. However, despite of the contextual links between quotation and film reality that can be found, the meaning of quotation is not fixed and oversteps the meaning of metaphor, forming a wider sense and allowing polysemanticism.

The strategy of quotation becomes a looking glass. Poetic logic and the moments it marks by quotation are gateways to an alternative reality related to dreams, memories, visions and meditative states, just to remind of the analysed above episode of levitation from *The Sacrifice* departing from reality and heading for the realm of surreal, while leaving the viewer with unanswered ambiguity. And yet, according to Tarkovsky, this endless series of senses, in which the viewer must vanish, is the most natural device the most likely embodying reality of life.

⁶ Here and forth translation from Arkady Petrov's interview with Edward Artemiev is mine.

⁷ In the opera it contrasts with the theme that represents sensual love.

⁸ The nature of their feelings is understood far in the end of the film, while the quotation sounds in the beginning: in this moment the wife has a fit of hysterics after *Stalker* has left to the Zone again and she cast reproaches upon him.

⁹ *Stalker* has been arrested for being a guide to the Zone, and his only child was born disabled.

FRANZ LISZT – A DILEMMA OF STYLISTIC INTERFERENCES

Mihaela-Georgiana Balan
University of Arts “George Enescu”, Iași, Romania
mihaela.balan87@yahoo.com

Abstract

Considered both as a national and a universal artist, Franz Liszt has inflamed a deep process of continuous progress and radical changes in music, on every level he has undertaken: piano playing, composition, conducting and writing about music. He remained in the history as a complex musician, with a rich activity, maybe the most visionary composer at that time, because his personality was so controversial, that he literally shocked his contemporaries in every parameter of his art. There are numberless books, biographies, treatises, studies, dissertations about his activity, written in different manners and using various analysis techniques. The purpose of this paper is to go beyond some texts where Franz Liszt was approached as one-sided figure, in order to outline his personality as a whole, by pointing some key-elements in his artistic psychology, some deep resorts of his composing principles. In this regard, I have chosen some well-known authors who wrote about Liszt and have kept the most representative elements of their works to describe him, trying to ‘catch’ the essence of the great Franz Liszt.

1. Introduction – Franz Liszt’s position among the 19th composers in the History of Music

Tradition, especially innovation, elevating idealism and revolutionary spirit - in one word, we are speaking about genius. These are some terms that might summarize the aesthetics of the 19th century, with reference to that great artist considered the soul of Romanticism, a man completely devoted to his generation and its ideals. His name was Franz Liszt.

Equally considered a national and universal artist, Franz Liszt has inflamed a deep process of continuous progress and radical changes in music, on every level he has undertaken: piano playing, composition, conducting and writing about music. He remained in the history as a complex musician, with a rich activity, maybe the most visionary composer at that time, because his personality was so controversial, that he literally shocked his contemporaries in everything he did.

Because of the nature of this work, we can't raise an innovative, unheard or spectacular point of view on Franz Liszt's personality. He became, in time, a true legend in the history of music. He was approached in countless books, biographies and studies from different angles, in order to be described with respect to his amazing life, his polyvalent activity, or his romantic psychology - which was considered to be a controversial spirit.

He was described in different manners: technically, analytically, metaphorically, philosophically and so on. We will offer some examples: 'magnetism' and 'electricity' by Heinrich Heine, 'a gifted joker' by conductor Hermann Levi, 'nice and generous, arrogant and whimsical', with a 'kinetic music, meant to amaze, to astonish' – as wrote Harold Schonberg, 'apparent humbleness' – in the famous caricature and cartoon magazine from Paris *Le Charivari*¹, 'gallantry of a knight', 'tendency towards splendour and declamation'² – by Romanian musicologist Eugeniu Speranția, 'a piano sorcerer'³ – by Ioana Ștefănescu, 'sulphurous greatness' – by Charles Rosen, etc. All these attributes reflect the malicious curiosity of his contemporaries and also the attempt of the generations to come to 'catch' his being. He was envied, discussed and he became the subject of many intrigues, polemics around his existence. Unlike his older music colleague Niccolò Paganini, whose destiny gave birth to different Mephistophelian legends (fed by the violinist himself), Liszt chose a clear, rational way of being, organized according to his native impulses and to his huge responsibility for his artistic gift. Beyond every calumny and gossip about him, Liszt had a precocious wisdom, being conscious of the high meaning of his endowment. This is why he has invested a great quantity of physical and inner energy in order to promote the young gifted players, composers, writers, but with no financial resources or wealthy connections.

The spreading of his talent and his music, his European success are due to his career developed in the main artistic centres, because Liszt was, at a high level, a 'vagrant' musician, a passionate traveller, always wanting to meet new people. We would like to quote some observations made by a famous radio and TV producer, referring to Liszt's permanent willing to meet and conquer the unknown: 'artist having the great delight of travelling', 'a musician who knew that all the roads towards us pass around the globe', 'a seismometer of his century, a musical guide of Europe.'⁴

2. Franz Liszt approached by musicologists

Among the few musicologists who have emphasized the nature of Liszt's genius were Béla Bartók and Emil Haraszti. If Bartók is notorious in the history of music, Haraszti must be introduced as a Hungarian historian and critic of the first half of the 20th century, interested in composers such as Chopin, Liszt and Bartók. Haraszti has written many studies and specialised papers focused on biographic elements essential for their evolution, specific language features shaped on the background of national conscience belonging to the native place. Bartók has found the palliating circumstances for the frequently called 'exaggerated Romantic pathos' in the context of the period that reached its pinnacle, while Haraszti has emphasized the influences assimilated by Liszt during his studies and journeys through the entire Europe. Thus, the German School (represented by Robert Schumann, Richard Wagner, Johannes Brahms), the French Culture (Hector Berlioz, Frederic Chopin, César Franck, Camille Saint-Saëns), the Ital-

ian School (with its main composers representing the specific *bel-canto*: Gioacchino Rossini, Gaetano Donizetti, Vincenzo Bellini, Giuseppe Verdi) and the Russian School (to whom he had some connections, yet more distant and formal), all these cultures have determined the evolution of the Hungarian composer. Thus, Liszt has developed himself by constantly relating his ideas and principles to the romantic context of his contemporaries.

A very important musicologist of the 20th and 21st centuries is Serge Gut, author of many important works, studies, papers focused on musical language from the 19th century and the first decades of the 20th century. He is well known for his particular concern in Franz Liszt's personality, considering that his stylistic influences can be divided into two categories: general and musical. One has to take into consideration the fact some **interference**⁵ didn't have a major impact on his aesthetic orientation, but offered him some reference points in order to find his own path among his predecessors and contemporaries, in the general context of the history of music. There are many contradictory perspectives on Franz Liszt's origin, because of his birth place, his studies in different musical centres, his settlement on short or long term in different places, which led to the claiming of different European countries regarding his stylistic affiliation. As Serge Gut concludes, this fact has a less significance than the entire variety of the mentioned interferences.

From this point of view, it is important to mention the influence (and not only the interference) of the Hungarian Gypsies. This matter also raised many polemics about the priority of gypsy elements compared to the Hungarian, national things, or the opposite. Liszt has been particularly attracted to the gypsy music from Hungary, even if he got into contact with many other national contexts of gypsies from abroad. In his book *Des Bohémiens et de leur musique en Hongrie*, Liszt explains three main ideas:

1. The musical art common to gypsies and Hungarians, related to their Asian origin.
2. The anteriority of the gypsy music
3. The superiority of the gypsy music⁶

Serge Gut used some quotes from Liszt's ideas referring to his Hungarian Rhapsodies, which were named after the 'epic' element inside the melody inspired by Hungarian folk songs, leading to the unity and the coherence of all works entitled similarly. 'Hungarian people adopted gypsies, who became national musicians. Thus, Hungary might claim with good reason the paternity of this art, nourished with its own wheat and vineyard, raised under the sun and close to the shadow of Hungarian trees. Their music is related to the most glorious historical events of their homeland and to the most intimate memories of every Hungarian inhabitant.'⁷

From the purely musical point of view, one can find elements specific to gypsy music which can be observed in Franz Liszt's work:

- the gypsy scale (having two augmented seconds)
- the rhythm, originated from a gypsy dance named *verbunkos*, usually played during Napoleon's campaigns;
- melisma and different ornaments, frequently overloaded (leaning notes/ *appoggiaturas*, grace notes, *échappé* notes, repeating chords on great rhythmic values or very short durations.

Example 1 – Franz Liszt – *Hungarian Rhapsody* no. 2, ms. 1-8

3. Liszt – pianist and composer

The first feature that assessed Liszt in the glorious height of European culture was his pianistic virtuosity. Among his predecessors, W. A. Mozart was firstly a musician and secondly pianist, unlike Muzio Clementi who was in the converse situation; among his contemporaries, Robert Schumann wished to become a great pianist, but the circumstances of his life led his career towards composition and musical critics, while Frédéric Chopin was an exceptional pianist, a very appreciated pedagogue, but all these activities had an ordinary function – to ensure his daily income, because his deepest aspirations were focused on musical composition. Franz Liszt is a particular case among the virtuosos of the 18th and 19th centuries, being considered unanimously a genius of piano playing. While playing, he proved to be a very talented interpreter of the musical meanings, a creator of new significations and a gifted pianist. ‘Liszt was the first to understand the dramatic and emotional meaning of new instrumental techniques (around 1830), accomplishing one of the greatest revolutions in the music created for keyboards until that moment of the history. He configured what would later become pianistic romantic sonority.’⁸

There were also many discussions concerning Franz Liszt and Niccolò Paganini as similar cases from the artistic point of view. Even if the pianist was inspired by the fascinating violin technique mastered by Paganini, who cultivated in him the strong desire of transposing the principles of ‘acrobatic’ virtuosity in the pianistic art field, this influence did not expand to the level of compositional general principles. Compared to Paganini, Liszt had a much larger amount of works and personal strivings that had nothing to do with his purpose of remaining in history as a victim (or winner?) of a Mephistophelian pact. Liszt used his talent in different manners and for different purposes: in the first part of his life, he aimed towards becoming famous, searching for success, recognition in the entire Europe of his brilliant talent, and later, after reaching a certain level of artistic maturity, he focused his energy on helping others and devoted himself to altruistic principles.

Franz Liszt also had some personal qualities concerning his social attitude, which brought him in the centre of the political scene, becoming in some of his European tours, a potential

⁸ Valentina Sandu-Dediu, *Choices, attitudes, affects. About style and rhetoric elements in music*, Didactic and Pedagogical Publishing House, Bucharest 2010, pages 145-146.

risk factor for the imperial doctrine. The public all over Europe became part of a transcendental musical experience while seeing him playing in his innovative eccentric manner. Even if Liszt hasn't expressed himself directly upon political views or perspectives, he inspired his audience towards freedom and independence only by his way of being, playing and composing. Anyway, he became a political man after the middle of the 19th century, and he became a point of interest for Austrian governmental authorities, who supervised/watched him closely during his entire tour in Hungary in 1846.

Freedom, the symbol of many romantic ideals, was suggested to his public on many ways and levels:

1) Franz Liszt had a particular attitude on the stage, characterized by bravery, gallantry, natural exteriorising of his artistic feelings expressed by large gestures, which involved not only hands and forearms, but also shoulders, feet and centre of gravity. Liszt entitled his apparitions 'musical soliloquims' and he characterized himself as it follows: 'Bored by the war and unable to conceive a programme to make sense, I have dared to plan concerts by myself, making fun of his famous quotation, as an artistic parody: "Le concert, c'est moi!"...'⁹

2) Another way of expressing freedom was the content of his works: Liszt transposed into music literary ideas, poetic feelings, promoting programme music. The freedom to choose a certain literary resource of inspiration allowed him a boundless imagination, where the musical programme had a suggestive function. Unlike Berlioz, who followed the narrative stages in all his works, Liszt was interested in 'catching' the essence of his initial idea, using a generalizing programmatism. He didn't evoke either narrative details or complex features of depicted characters, but he rather emphasized the essential line of the dramatic conflicts. In other words, he evoked the general in particular images.

3) The artistic freedom is obvious on the structural level: on one hand, in traditional forms, inherited from previous centuries and later transformed according to expressive needs of the work (examples: sonata as a macro-form of the genre, programmatic symphony, concerto-poem conceived as a continuous movement, unified through cyclic themes); on the other hand, there were new musical genres and architectures freely structured, according to individual composing criteria (symphonic poem, rhapsody, ballade).

A direct consequence of expressing freedom was the narrative style. In Liszt's opinion, the function of Music is not to traduce in sound abstract concepts, but to express what equivocates to the limited transposition of emotional states on the verbal level. This idea was named by Carl Dahlhaus 'the *topos* of ineffable', and he thought that 'music is the access path towards truths that only 'she' can express and which can't be expressed in 'her' deepest essence by verbal communication (even if it's poetic).'¹⁰ This is similar to the literary field, where writers had as basic condition the fight against the formal rhetoric aesthetics of Classicism in order to develop the romantic drama and other new genres. This aspect partially explains the decline of the classical sonata (as a genre) in the first decades of the 20th century, because of the interest showed by composers in innovative directions. Jean Pierre Bartoli explains the way that narrative style of the content influences the structure, generating a specific practice largely used during the Romanticism – '**aesthetics of fragment and sketch**', initiated by Schlegel¹¹, then used in literature by

⁹ Liszt, quoted by Harold Schonberg in *Lives of the great composers*, Lider Publishing House, Bucharest, 2008, pages 192-193.

¹⁰ Jean-Pierre Bartoli, article/ chapter 'Rhétorique et narativité musicales au XIXe siècle', en *Musiques: une encyclopédie pour le XXIe siècle*. 4th vol.: *Histoires des musiques européennes*, under the direction of Jean-Jacques Nattiez, Paris, 2006, page 1026.

¹¹ In Charles Rosen's volume, *La génération romantique (Chopin, Schumann, Liszt et leurs contemporains)*, Gallimard Editions, 2002, page 81, one can find quoted the definition given by Friedrich Schlegel to the notion of 'fragment' in the 19th century: 'Similarly to an artistic work in miniature, a fragment has to be completely detached by the surrounding world and

Hoffman and in music by Schumann (in his piano suites), Liszt (in *Années de pèlerinage*). Therefore, Diderot stated that art needs ‘more life and less structure.’ The most efficient technique to develop musical narrative style is to gather the musical figures in a single unitary work and represent a certain character or idea by means of a specific theme. The ‘fix idea’ used by Berlioz has been transformed by Liszt into a rhetoric principle of structural construction. It has been named the concept of ‘**thematic transformation**’¹², which allows the evolution of an entire work according to a certain narrative development. This technique has been approached firstly, in *Vallée d’Obermann* and *Les cloches de Genève*, and after that, Liszt would extend its usage in most of his works. Another narrative principle is the ‘**continuous development**’ present in *Sonata in B minor*, whose architecture is a synthesis of all techniques and principles of form introduced by classic composers: the principle of exposition in sonata and fugue forms (the recapitulation of the main theme in this work is a great *fugato*), the variation principle (which is used in order to create a series of metamorphosis and transformations of themes, by free variation), the strophic principle, based on juxtaposition, by inserting a strophic form inside the middle section of the sonata structure (section which is in contrast with the other moments, from the point of view of the tonal, agogic expression. I must point out again the fact that these principles are used freely and naturally, so as the lead to a cursive, fluent musical discourse.

Despite the open structures, Liszt has manifested the need for unity, and he has accomplished it in many ways. Another well-known concept in the romantic period, in all fields of art, is *co-incidentia oppositorum* (the unity of contraries), which can be found, for example, in *Faust* Symphony; here, one can find specific musical themes ascribed to particular characters (such as Faust, Margarita, Mephisto). Margarita’s simple features are in deep contrast with Faust’s complicated personality. Mephisto, who is looking for the negative influence and the destruction of mankind, is musically represented by Faust’s theme and motives in a caricature-like manner. Margarita’s theme is the only one that remains untouched and victorious. Therefore, it can be said that another way of accomplishing the whole unity, the coherence of the entire work, is the technique of associating musical themes to different characters, situations, feelings, symbols, using them as circulating musical ideas (‘**cyclic themes**’) in all movements, leading to programme music.

From the ‘architectural’ point of view, Liszt has gone beyond the inherited structures, traditional forms and largely used patterns. He has always created his own structures, becoming a genuine inventor in this field.

The **sound parameters** are also treated as innovative elements, receiving from Liszt new appearances, influences and ‘colours’.

a) **Melody** – in Liszt’s way of creating, it has a magnetic attraction power, a certain impetus, enthusiasm and a deep restlessness specific to him. Melodic structures are based either on traditional items or on new, original elements.

- medieval modalism, in a Gregorian manner (in works such as *Chapelle de Guillaume Tell*, from the first book of *Années de pèlerinage*, or in *Ballade no. 2 in B minor*, *Totentanz (Danse Macabre)* and many others;

sufficient to itself, like a hedgehog.’ The hedgehog, as Charles Rosen continues, ‘is an agreeable creature, which rolls like a snowball when feeling in danger. His shape is well-defined, but his outlines and edges are vague. The metaphor of the hedgehog is spherical, built after a perfectly geometrical pattern, and this is why it is adequate to symbolise the romantic way of thinking, beginning with the attractive image of a body which is protecting himself on the outside using his own body features. Similarly, the fragment is broken from the outside context. In fact, its isolation is aggressive: it gets detached from the world as much as the hedgehog feels protected.’ (page 82)

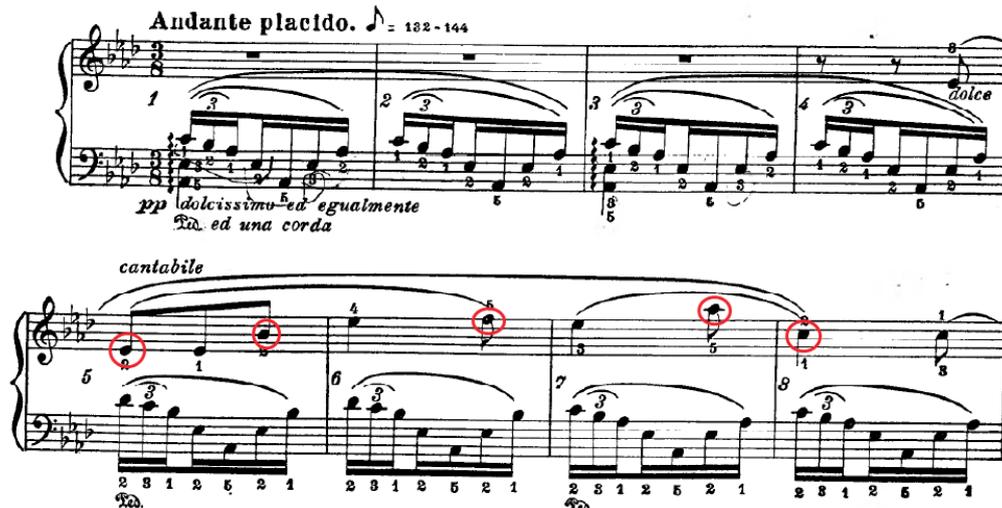

¹² Jean-Pierre Bartoli, article/ chapter ‘Rhétorique et narativité musicales au XIXe siècle’, en *Musiques : une encyclopédie pour le XXIe siècle*. 4th vol.: *Histoires des musiques européennes*, under the heading of Jean-Jacques Nattiez, Paris, 2006, page 1034.

Example 2 – Franz Liszt – *Totentanz*, ms. 13-21, tuba > Theme *Dies irae* is exposed in the Dorian mode on D and harmonised using elliptical chords (without third)

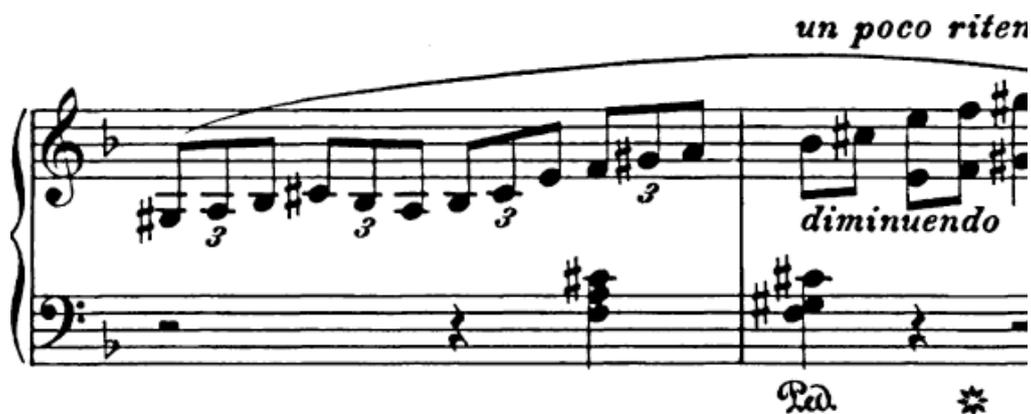

- pentatonic scale – in *Au lac de Wallenstadt* and *Églogue* from the first book of *Années de pèlerinage*;

Example 3 – Franz Liszt – *Au lac de Wallenstadt*, ms. 1-8

- the musical symbol of the cross – is the result of ascribing a religious semantic meaning to a pentatonic structure. This scale is based on five sounds – C, D, F, G, A.

Example 4 – Franz Liszt – *Sonata in B minor*, ms. 363-368 the pentatonic structure is transposed on D, E, G, A, B.

- the gypsy scale – used by Liszt in many works, in different melodic hypostasis and harmonic contexts.

Example 5 – Hungarian Rhapsody nr.17, ms. 7-10

• the tone-scale – used by Liszt and other Russian composers before Debussy, who imposed it definitely in the European music as a new structure (the hexatone scale, consisting in six tones, without any specific gravitational centre), leading to attractive exotic sonorities.

Example 6 – Franz Liszt – *The Great Chromatic Gallop*, ms. 230-238

b) **The rhythmic parameter** is a result of Liszt's interest in discovering and using folklore items, which enrich the musical discourse and offer its national sonority, original accents and a specific energy. Thus, rhapsodies acquire a very rhythmic personality, with Hungarian and gypsy influences.

c) **Harmonic structures in Liszt's works** are based, similarly to melodic ones, on traditional elements, extending itself even more than the so-called 'enlarged tonality'. There are chords composed of fourths, fifths, horizontal lines consisting in fourths, fifths, parallel un-functional sixths, chords mixtures, chords with Dominant function ninths, chromatic unsolved chords and so on. Examples are redundant in these cases, because Liszt work is abundant in this kind of exceptional situations, which are quite natural to him. In the same category of vertical structures can be included pedals and cadences.

The pedals used by Liszt can be organized in: fix pedals (like in the beginning of his *Ballade no. 2*), mobile pedals (simple or enriched with other notes), and *accompaniment*-like pedals (which can be double or triple).

Example 7 – Franz Liszt – *Sonata in B minor*, ms. 727-735 – melodic pedal in the grave register, represented by an obsessive *ostinato* of the β motive.

Allegro moderato.

The image shows two systems of musical notation for a piano piece. The first system is marked "Allegro moderato." and "p sotto voce". It features a treble clef with a key signature of two sharps (F# and C#) and a common time signature (C). The bass line contains a repetitive melodic pattern of eighth notes, with the first few measures highlighted by a red rectangular box. The second system is marked "poco crescendo" and "pp", and includes the instruction "un poco rall." at the end. The bass line continues with the same repetitive pattern.

Liszt's cadences are perhaps the most spectacular when compared not only with his contemporaries, but also with the generations of composers from the following decades after his death. Focusing on the ending harmonic successions from his piano works, one can notice a great variety of chords chains, *ajoutées* elements, superposed structures which could hardly find harmonic explanations, unusual degrees to end musical phrases or even entire works.

For example, in the ending of the well-known work *Vallée d'Obermann*, Liszt inserted a confusing chain of chords: descending second degree, which is used as base for the major chord F-A-C, adding an augmented sixth (D sharp as an *ajouté* element, being the seventh chromatinized degree of E minor). D sharp is preceded by a superior semitone, generating a very dissonant chord, searching its resolution in a descending line towards D sharp, then natural C, B, A and G sharp. The final solving chord of this chain has an unexpected auditory effect; the listener is not aware of the next dissonant element which would appear, the appoggiatura represented by C on the major chord E-G sharp-B (the resolution of C).

Example 8 – Franz Liszt – *Vallée d'Obermann*, final harmonic chords chain:

The image shows a short musical passage in a piano score. The key signature has two sharps (F# and C#) and the time signature is common time (C). The passage is marked "ff rit." and features a descending line of chords. The notation includes various fingerings and articulations, such as slurs and accents, indicating a complex harmonic progression.

The beauty of these harmonic paradoxes does not have to be expressively searched in the way of chaining chords or in the very surprising modulations, because they emerge from the

spontaneous and limitless phantasy of Liszt. He had directed the practise of modulation towards enlarged tonality, before Wagner did the same thing at a higher scale, reaching moments which could be characterised by future concepts like suspended harmony, multiple centres, sonorous scales without tonal-functional laws or Arnold Schönberg's dodecaphonism. Thus, the Hungarian composer proved an unprecedented courage in constructing final harmonic formulas, but he never gave up to 'gravitational centres' imposed by tonal or modal systems. From this point of view, he proved to be a composer endowed with a special originality, avoiding the replacement of an automatism with other similar structures and trying to find in each case a proper, but personal solution.

d) Dynamics and agogic are fields having already been emancipated by previous Romantic composers. Franz Liszt did not make any particular improvements of these elements, but his way of conceiving the dynamic and agogic processes had a significant role in designing new structures. The main reason for highlighting this point is the free succession of intensities and tempos, which leads to strong contrasts, sometimes aggressive. Thus, he focused on creating musical colours and spatiality impression. 'Aspects such as texture, sonorous intensity, violence and delicacy in gestures can replace the function of pitch and rhythm in musical organisation process.'¹³

4. Liszt – conductor and essayist

Beyond the two previously described sides (pianist and composer), Liszt has played a significant role in the history of music as a **conductor**. In 1842, he was given the title of Great Ducal Director of Weimar Court, where he used to come regularly until 1849, when he definitively settled down here, turning Schiller's and Goethe's town into a genuine centre of European musical culture. This is how Liszt began his conducting career. As an artist of the baton, he brought on stage many elements of his previous pianistic thinking and musical philosophy. Unlike the strictness of traditional conducting, the attitude promoted by Liszt was based on orchestral effects suggested by personal gestures, intensively expressed symphonic dramatic character, sonorous colour created by emphasizing certain melodic lines in the score or certain instruments (or groups of instruments). Neglecting the metrical accents, he was more interested in obtaining the sense of general, of unified wholeness, similarly to his younger contemporary, Richard Wagner. We can't deduce any mutual influence between them or any inspiration source in their musical practice, but the history of music has focused on their co-operation, professional support and some friendly interaction between them. Liszt and Wagner had a series of common principles, the most important being the freedom of tempo, the elastic movement of musical discourse, in which every detail was adapted to musical, general needs.

Another hypostasis of Liszt is the writer, namely the musical critic. His literary work, written in French, has been organized in six volumes. Some texts were published during his life time in different magazines of the 19th century, such as *Musical Journal*, published in Paris. The most renowned work written by Liszt seems to be the monographic volume dedicated to Frederic Chopin, in which he proves a deep admiration for the Polish composer; here, he presents relevant details about his personality, about the genesis of certain works and relates different interesting events of their artistic life in aristocratic salons in Paris. Thus, his book achieves the quality of a historical document of a high value. Liszt was aware of the importance of the entire Romantic phenomenon, implying artists from different fields, leading to great works of the 19th century. Even if Chopin was the opposite of his artistic style, they were both major figures among the entire constellation of Romantic artists.

¹³ Valentina Sandu-Dediu, *op.cit.*, page 146.

Other literary works signed by Franz Liszt are: *About artists' situation and their place in society*, *The letter of a wanderer towards George Sand*, *The letters of a bachelor in music*, *Paganini (obituary notice)*. The amplitude and certain stylistic subtleties of Liszt's literary work generated many discussions concerning the authentic signature of the Hungarian composer from his writings. The most important equivocal source is the chronologic structure of his writings, divided in two categories: the first between 1835 and 1841, and the second between 1849 and 1859. The two periods coincide with two important relationships, in their climax, with a significant influence on Liszt's existence. In 1841, his connection with countess Marie d'Agoult gets more and more deteriorated, and that year is also significant when speaking about ceasing his essays to musical critics. The second series of articles belongs to the period of cohabitation with Princess Carolyne Sayn-Wittgenstein, which is not just a simple coincidence. The relation between Liszt's literary publications and the two famous women who had won his interest and appreciation is obvious, but one can't establish exactly how much they contributed to his writings. The most part of information has been provided by Liszt's correspondence with the countess, the princess and other close friends. There are musicologists who had access to those letters, thus revealing intimate details of the writing process while being connected with the two ladies. Emil Haraszti, Peter Raabe, Alan Walker have written about these aspects in their monographic works. Lina Ramann is known to be the first author of a complete biography of Franz Liszt, written under the attentive supervision of Princess Wittgenstein. Based on the sketches found among his manuscripts, it has been concluded that Liszt wrote entirely some of his essays, while other had a writing process which involved the inspiration or contribution of the two women. Researchers think that Liszt used to write down his ideas, to organize and reinforce them, leaving the developing process, the literary polishing and final artistic 'touch' to countess d'Agoult and later to Princess Wittgenstein, who were endowed with a literary gift. Musicologist Serge Gut has concluded that 'Liszt's co-operation with Marie d'Agoult proved to be useful and positive, because her help was graceful, well balanced and intelligent; his collaboration with Carolyne de Sayn-Wittgenstein was rather misfortunate, due to a certain overflowing verbal exuberance, that led to invasive stylistic print. His works from the first period are naturally written, pleasant to read and coherent from the stylistic point of view; those from the second period are quite awkward, bombastic and hard to read, but they can offer precious information if they are read carefully, with the necessary patience.'¹⁴

Beyond these details about writing, one has to mention the most significant literary and critical work accomplished by Liszt: *Des Bohémiens et de leur musique en Hongrie (About gypsies and their music in Hungary)*. Finished in 1859, this work shows some special research qualities in a field which hadn't been theorized yet at that time. His way of expressing ideas and arguing them in a complex research work has some Romantic features, such as declamation, metaphorical phrases and excessive enthusiasm, which were probably effects of the same outside intrusion in his individual activity. Despite these things, the lack of unaffectedness and naturalness does not affect the quality of the content. Maybe Liszt hasn't had a clearly established method to gather information and to organize his ideas, which weren't always very well sustained, but his work is placed among the most important documents in the history of Hungarian folkloric research field.

5. Conclusions

With his multiple artistic personality touched by the glowing spark of the genius, Franz Liszt has worked on many levels, dedicating his life to those fields which made their call from an early

¹⁴ Serge Gut, *op.cit.*, page 24.

age: piano playing, composition, conducting, also being interested in writing about his time and contemporaries. He tried to compose one single opera (*Don Sacho*, or *The Castle of Love*), but he focused his artistic energy towards those musical genres where his gifts were consciously turned into great musical masterpieces. Speaking from the perspective of temporal evolution, one can make a difference between Liszt the young artist – virtuoso, extremely energetic pianist, who was able to compose and play *Chromatic Gallop*, *Transcendental Études*, countless transcriptions, paraphrases and reductions of great symphonic works for piano, turning his instrument into a real orchestra, and Liszt the older man, a brilliant symphonist, a true ‘inventor’ in music (author of symphonic poem, recital, innovative free structures), promoter of classical programmatic genres (symphony, sonata), creator of depictive ‘musical paintings’, but also author of religious genres (masses, oratorios, chorales). In his late years, virtuosity is not a purpose any longer; it merely became a mean to express the poetical meditation and intimate spiritual beliefs.

As for his impact on the 20th century’s musicians and on those from nowadays, one can make an interesting inversion of Liszt’s ages. His hypostasis as a mature artist could be perceived as a face of his refreshing youth, characterised by deeply vibrating feelings and thoughts, rich inspiration, great delight of living and enjoying all his experiences, despite the years that added to his existence.

In the end, we find it proper to remember his famous funny action, ‘committed’ by Liszt in one of his European tours, when he had to fill in the accommodation paper of a hotel from Geneva. Common questions were answered unusually, with a great sense of humour:

Occupation: Philosophic Musician

Born in: Parnas

Coming from: Doubt

Travelling to: Truth

MUSIC AS A METAPHOR OF LIFE

Sandro Santos da Rosa
Faculdades EST, São Leopoldo, RS, Brazil
sandromusik@hotmail.com

Abstract

The paper looks at the nuances that make music a way of representing the world, relating to it and concretizing new worlds. It verifies how music is a metaphor of life, of our Self, of the Other, of Us, and how these relationships are metaphorically present in the musical structure rhythmic, melodic, contrapuntal and harmonically. Methodologically, the literature review will show how music became a means of symbolizing, signify and re-signify human existence through sound and its organization by the human being, as a means of communication that gives and attributes meaning to life. Thus, it will draw some considerations that show the idiosyncrasies of human behavior with music and their interaction with life and with its creation. The paper concludes that music is a way of trans-signifying the real, of communicating something, of informing, of going beyond what has already been set, of symbolizing existence as a whole.

1.1. Initial considerations.

This article is about the importance of music for the human existence. There will be three topics. The first one presents the conception of some scholars that reflect about the function of music. The second one glimpses the subtleties that make music a language that cannot be compared to the word. The third and last one analyses the significance of music. Methodologically, this article restricts itself to precisely gathering important information that determines music as one of the most important experiences lived by the human being.

1.2. Music in the human existence.

There are countless and controversial opinions and theories about the origin of music. The first theories are connected to Greek mythology figures and biblical characters. However, nowadays it is already known that its origin is much older with sounds already produced by the

ancestral human being.¹ About music, the only consensus there is between scholars is that its vital part is formed by two elements: rhythm and sound; and that the human being, with its prodigious intelligence and creative power, joined them into a marvelous symbiosis, making the music the only language that can be comprehended by all the peoples.^{2 3}

It's important to ratify the intelligibility of music concerned to the human life and the human rational relationship with art. The exclusivity of perceiving, producing and searching for the beauty distinguishes the human being from other living creatures. Music doesn't need to be clarified or called upon any kind of statement. It is essentially organized rhythmically, melodically, harmonically from chosen sounds by humans, who are the only able to establish the intermediation or relation between art and the world as a whole. In conclusion, music comes from the human rational intervention and is diffused by the human intellectual action of production, interpretation and appreciation.

The ethnic musical production of a people, that creates and appreciates musical elements instead of other characteristics present in other cultures, has been studied since Darwin by musicologists, musicians, neuroscientists, psychologists, sociologists, anthropologists, music therapists, etc. Darwin himself believed music was developed by natural selection, integrating human and paleo human mating rituals. Steve Pinker, a reputed cognitive scientist, said that "language, with all evidence, is an evolutionary adaptation."⁴ However, since music is a kind of language/significance through signs and meanings that may be considered a language, it is part of all human processes of evolution and rationality, developing in each cultural sphere together, with other languages, ethnic particularities that are defined by the time and space each people live in.

Throughout history, many thinkers of a variety of fields have expressed their worship for music. Martin Lutero, 1483—1546, eternalized his comprehension about music in the following way: "it's a gift from the gods and not from the men. [...] With it you forget all the anger and addictions. So I'm not afraid to claim that, after theology, no art can be compared to music."^{5 6}

For Nietzsche⁷, 1844—1900, while words reproduce a phenomenon, music reproduces reality. Music comes before the word metaphysically^{8 9} and has primacy over it.

Susanne Langer, a music philosopher, who studies reflections about signs, the significance, the meaning and their esthetic transmutation¹⁰, explains that: "the artistic activity [...] is an expression of primitive dynamism and unconscious desires and uses represented objects and scenes for solidifying the artist's secret fantasies"¹¹. From this, the author considers that "music is preeminently nonrepresentative [...]. It presents its pure form not to beautify"¹², but to show

the real essence of the human being. In the same way, Nietzsche relates music to life. For the philosopher, life is (or should be) “will to power”¹³. Music related to the will to have power, that is, about the living beings, influences the most intimate elements that constitute them, the cells, the tissues and the organs.¹⁴

J. de Moraes, important Brazilian writer, songwriter and researcher in the field of music, says: “Music is, among other things, a way of representing the world, relating to it and materializing new worlds, [...]. In music, what we call past is existent, [...] fluid meeting point that sends us to what we still don’t know. Simultaneity – since the interlacing of temporal planes, spaces, ideas, memories, feelings, structures – transforms the present that indicates the first category: fantastic field full of possibilities to come.”¹⁵

The author alerts that there is a series of misunderstandings about the statement that says that music is a universal language that can be comprehended by everyone. Moraes questions: “universal phenomenon – it sure is; but universal language – to what extend?”¹⁶

However, the next topic discusses how music can or cannot be comprehended as language.

1.3. Music and language

All the peoples in the world have developed musical manifestations, sound with some type of rhythmic organization. Different from the oral language, which can be translated and adapted to other cultures without excessive damage, “the musical manifestation of a certain people, [...] loses its fundamental characteristics when translated to other community’s conception”. This can be included in the following question: What meaning does an Islamic/Moslem song – that is religiously sung at a certain time, on a certain solar day, with a certain Arabian melodic scale – have when played in a Catholic church in Brazil at a Christmas celebration?

According to Nietzsche:

“Music is not an universal language that goes beyond time, as was told many times in its honor, it’s exactly a measurement of feeling, heat, and the condition it brings within itself, like an inner law, a culture perfectly determined, bound to time and space”¹⁷.

In a similar way, the Brazilian musician and researcher J. de Moraes made an intriguing question: Can the orchestra Balinese music, that used to be part of an ancient warriors’ dance, and now has become a ritual dance presented in temples, be understood by a Brazilian person that doesn’t belong to the *Javaé* tribe?¹⁸

The point of the question is in the word understood. The problematic of the word to understand in relation to the communicative agents of the language, the sign, the significant, the experiencing, the signifier, is part of the semiological tangle, which is a lot discussed and controverted by the scholars of semiology, language and music.

If we consider that the simple comprehension of something stated is characterized as language, we could say the musical language is exclusive for musicians with solid formation since they would perceive, understand and comprehend the Balinese music and its rhythmic, melodic and harmonic structures, even not being part of that culture. However, the ethnic/cultural

¹³ This term was developed by the author largely and mostly in the second half of his work. In general, the will to power is not only the essence of life, but also the need of it.

¹⁴ Dias. 2005. 60.

meaning would be missed. A layman in music that is not part of that culture could really say that wasn't affected by any communicative agents. They only noticed the sounds with the vibration felt by their eardrums, which only enabled them to realize that that was a piece of music. But what does that mean? On the other hand, to a layman in music that is part of the Balinese culture, the song would mean, in its cultural measurement, according to Nietzsche, something that is already part of their *éthos* (costume, religious ritual, dance food, celebration, love, wedding, death, etc.)¹⁹.

According to Abbagnano, in his Philosophy Dictionary, language is the use of intersubjective signs, which are the ones that make communication possible, but the signs can only be part of a linguistic speech with a certain function: they can combine in a limited and recognizable way, meaning something to a certain code interlocutors. It's possible to see through the optic of the musical language that are levels of language (oral and written) and, therefore, levels of communication²⁰.

It's questioned what the perceiving, the understanding, the comprehending and the meaning have in common and what their relation is in the ability of the music to mean.

The oral language constitution by humans was built by aspects that are part of the musical language structure, that is, a word (a syllabic combination/a specific phonetics) only expresses something when the rhythm, melody, height, intensity and voice timbre are agreed in certain contexts determined by each culture. In some time, before humans started to speak, they babbled sounds, made faces and informed without words. These information, related to specific contexts, organized the language that, with the creation of codes and words, started to express limitedly the phenomena of the existence.²¹

It can be thought that the (written) phrase "I am sad", despite informing the sentimental state of a person, does not communicate anything for being below the sonorous sense that it has for the informed person. E.g. What is the convincing/communication power of a person who, in laughter, claims to be sad? What is the convincing/communication power of a person who, in tears, claims to be happy? A person stumbles on a stone, breaks their toe, cries and says: What a happiness!

As follows, the classical saussurean distinction between language and word.

"It is due to language, social part of speech external to the individual, that the ability of building up sentences is elaborated. [...] It is noticed that words produced due to language can be of two types: the words of communication/intercommunication and those of written material, [letters, poems, plays, books, etc].²²"

It is less absurd the perspective that music is a language, a way to communicate, to mean something, if we think through the saussurean view that goes towards to Nietzsche's proposal: "while word reproduce the phenomenon, music represents reality, which, being metaphysically prior to word^{23 24}, has primacy over it."²⁵

From this perspective, it was due to the musical structure (rhythm, melody, height intensity

¹⁹ Nietzsche. 78.

²⁰ This examination is about the previous pondering in which a musician is able to understand the content, the form and the musical structure of any culture, but he is not able to understand the cultural meaning of the songs that are part of the everyday life of different ethnicities because he does not belong to them. On the other hand, for a layman, a piece of music that accompanies a religious act or a dance may have a cultural and ethnical meaning that does not move anyone except the ones who belong to that people.

²⁵ Dias. 2005. 48.

and voice timbre) that speech, language and consequently words were produced and established as sonorous codes organized by each culture.

1.4. Music as the significance and representation of existence.

Considering music as a language that cannot be compared to the word, but an intensifier of the language, Claude Lévi-Strauss says that in the language “we have a sound and the sound has a meaning and there is no meaning without the sound to carry it. The music is the sound element that communicates”. However the author doesn’t consider music as a language since both music and word lack the same aspects.

To Lévi-Strauss:

“The basic elements of the language are the phonemes – that is, those sounds we incorrectly represent with letters – that doesn’t have any meaning alone, but are combined to distinguish the meanings. We could say the same about musical notes. A note [...] doesn’t mean anything alone; it’s just a note.²⁶”

Lévi-Strauss also says:

“In the next level of the language, we see that phonemes combine in a way to form words; and words, then, combine to form sentences. But in music there are no words. The basic elements – the notes – combine and immediately form a sentence, a melodic sentence²⁷.”

Now some considerations based on the conceptions offer by Lévi-Strauss: 1) The phonemes combine in a way they form words; 2) Comparing the phonemes to the musical notes, the latter combine in a way they form non-defined harmonic principles²⁷. Harmonic principles (two combined notes) combined to other notes (the placement of notes on the score, for instance) would correspond to the word in language. The difference would be in the formation of the sign because while the words are formed by syllables visually combined in the horizontal, the chord – which, in music, corresponds to the word in this approach – is formed by sound combinations that are written vertically in the score. The harmony between the phonemes makes up the words in which the phonemes are executed successively. The harmony between the sounds makes up chords in which the sounds are executed simultaneously.

Just like the words, already formed by syllables, *school, is, today, the, open* can be organized to form, among others, the sentence “Today the school is open”, the chords A minor, C major, F major, D minor, C major and E major can be combined to form, among others, the musical discourse C major – A minor – F major – D minor – E major – C major. When played in a polysemic way, considering the qualities of the sound, which are height, intensity, duration and tone, this sequence can be recognized by people who are part of the culture that song belongs to, informing, communicating, creating and recreating meanings to sad or happy moments, creating and establishing sentimental motives related to the cultures of the peoples. Example: Funeral march and/or wedding march. No words are said, but when they are played, at least the occidental culture knows what it is about, what the significant-sound presents, represents and means to each listener and, finally, it’s made clear what words couldn’t express.

Through this optic, music is language because it informs, communicates, means through signs and signifier the ineffable of a culture.²⁸ However, it’s a language that can’t be compared to the word. For example, in music there isn’t anything similar to the word ball. This way, the

²⁶ Lévi-Strauss, Claude. *MITO E SIGNIFICADO*. 74. Lisboa: Edições 70.

²⁷ Lévi-Strauss. 74.

²⁸ Alves, Rubem. 2007. *O ENIGMA DA RELIGIÃO*. 144. Campinas: Papirus.

virtue of the musical language is its ability to evoke and transmit feelings through the sound-musical expression. Feelings that words aren't capable of transmitting. "Communication [...] would be impossible without the signifying, that is, the social production of the meaning."²⁹ This is the key of the conception that assures that music is a language, since it's a way of communicating something, informing something, going beyond what there is. Go beyond that words want to say, be it in the religious worship, the play, the soccer game, the therapy, etc.

The English researcher John Blaking, as J de Moraes ascertained said:

"The Vedas (African Indigenous people) taught me that music can never be something by itself, and that all the songs are popular in the way that no song can be transmitted or have a meaning if there is no association between the individuals."³⁰

1.5. Final considerations

This way, this project gives a glimpse and proposes that the communication established by the musical language, structured by rhythm, melody, counterpoint and harmony, represents the association between the individuals and, so, it's a metaphor of life. Metaphor, in Charles Peirce's conception, is what represents the representative character of a *representamen* or sign³¹.

With this, in a semiotic proposal, music is the metaphor of life because time can only be noticed with the relativity between the events. The rhythm is movement, continuity in defined times and spaces. The rhythm accentuates the events, qualifies the spaces and, consequently, locates in time. Without rhythm, there is no life – there is no becoming. The melody is the subject and, in its individuality, meets in the counterpoint – in the coexistence – in the voice of the Other – the meeting with the Other - its only way to become Subject – to become *communitas*. The counterpoint is the relation between the subject and the other – the alterity. The harmony is the relation between the individuals in a society, with all the agreements and disagreements that are part of the becoming of the existence. The harmony is the constant tension and rest where the societies, their ethical and moral principles, beliefs, costumes and values change and transform.

Music as a metaphor of life is an idea in the place of other idea. Music reproduces the idealization of a reality. In the complexity of the human musical experience, music, as physical matter and event, acts as a fact in the place of other fact, enabling the making of music in a music therapeutic session or a religious ritual to be the rigorous reproduction of maximum demands of what the intellectual, sentimental, perceptual and cognitive faculties of the human being can do.

**SEMIOTICS OF
CULTURAL HERITAGES**

THE LITHUANIAN SINGING REVOLUTION AS CULTURAL HERITAGE AND SOURCE OF SOFT POWER

Dario Martinelli
International Semiotics Institute &
Kaunas University of Technology, Lithuania
dario.martinelli@ktu.lt; dariomartinelli.eu

Abstract

The present paper aims to look at the phenomenon known as Singing Revolution, in Lithuania, mostly within the frameworks of semiotics, cultural and political studies. After a short socio-historical introduction to the topic, the paper will focus on the way Lithuania has contextualized and handled the Singing Revolution at cultural and institutional level, particularly in the perspective of what, after Joseph Nye (1990 and, more specifically, 2004), has been called *Soft Power*. Indeed, despite the absolute centrality of the Singing Revolution in the Lithuanian struggle for independence (a centrality that becomes even more relevant when we think that, unlike the other Baltic States, several Lithuanian intellectuals and opinion-leaders were in fact musicians or musicologists), the Lithuanian academic and political institutions have devoted only a minor effort to analyse these phenomena and repertoires. Moreover, very timid were the attempts to academically promote them at international level, often resulting in international ignorance and misunderstandings (e.g., the Canadian documentary “Cultures in conflict” presents the Singing Revolution as an Estonian-only phenomenon, disowning Lithuania –and Latvia – of their historical roles).

What is the role of the Singing Revolution in the current Lithuanian intellectual and institutional discourses? Could the phenomenon become an important tool for cultural and diplomatic promotion of Lithuania abroad? Is Lithuania missing an important opportunity to reinforce its soft power?

This paper is part of the project “Music and Politics: An Analysis of Protest Songs and Lithuanian Singing Revolution”, funded by a grant (No. MIP-14172) from the Research Council of Lithuania.

1. Introduction

The present article looks at the social phenomenon known as Singing Revolution, occurred in the Baltic states during the last years of Soviet domination, focusing on the case of Lithuania, particularly in the perspective of what, after Joseph Nye (1990 and 2004), has been called *Soft Power*. Despite the absolute centrality of the Singing Revolution in the Lithuanian struggle for independence, the Lithuanian academic and political institutions have devoted only a minor effort to analyse these phenomena and repertoires. Moreover, very timid were the attempts to academically promote them at international level, often resulting in international ignorance and misunderstandings.

What is the position of the Singing Revolution in the current Lithuanian intellectual and institutional discourses? Could the phenomenon become an important tool for cultural and diplomatic promotion of Lithuania abroad? Is Lithuania missing an important opportunity to reinforce its soft power?

2. The concept of soft power

Originally formulated in Nye 1990, soft power (SP, from now on) became a fully-defined concept in Nye 2004, where it is defined as

(...) the ability to get what you want through attraction rather than coercion or payments. It arises from the attractiveness of a country's culture, political ideals, and policies. (...) When you can get others to admire your ideals and to want what you want, you do not have to spend as much on sticks and carrots to move them in your direction. Seduction is always more effective than coercion, and many values like democracy, human rights, and individual opportunities are deeply seductive. (...) But attraction can turn to repulsion if we act in an arrogant manner and destroy the real message of our deeper values (Nye 2004: x)

By extension, "SP" is an expression we can use also in relation a) to smaller communities, and b) to the processes that occur within them. In the first case, we can basically trace an axis that goes from single individuals to the largest communities, and detect SP in all the steps that go from one extreme to another. Of course, single persons can exercise endless forms of SP over other people: their charm, elegance, job, social/geographical origins, ideas, and so forth.

Secondly, SP is not just a form of communication, that goes from an A source to a B destination, A and B being members of two different groups. A and B can also belong to one single group, with SP operating with specific dynamics that encourage that group to progress in a given direction. This characteristic, too, covers the whole spectrum of communities, even including the special, proprioceptive, case of single individuals, who are certainly inspired by their successful features to develop them even further (e.g., career achievements, body fitness...).

Essentially, when SP goes from one group to another, it basically serves as promoter of the values of the former group, it builds a reputation, it attracts and persuades people, etc. When SP goes from one group to the *same* group, it mostly works as a reminder of the values of that group, it builds self-confidence, sense of commitment, etc.

Naturally, SP, as an expression, acquires particular sense when placed in opposition with "hard" power (Nye 2004: 7). Command, coercion and inducement are the three typical forms of behaviour of hard power, while agenda setting, attraction and co-option are the typical ones of SP. Then, Nye continues (2004: 8), when it comes to resources, hard power will likely use force,

sanctions, payments and bribes, while SP will mostly operate through institutions, values, culture and policies.

Needless to say, SP does not only work “in positive”. Attention towards a certain individual/community/country can also occur in terms of negative associations with the SP resources. Such effect can be generated by at least four conditions: absence of resources, bad reputation, lack of reputation, loss of reputation. If we take the example “universities”, we can see that these three conditions can all have their negative impact on a given group (say, a city). When a city has no university (absence), it may provoke such comments like: “Lousy city! There is not even a university here”. When a university exists but it does not have a good reputation, the effect may be something like: “Imagine! They have one of the country’s worst universities, here”. Thirdly, a lack of reputation may be expressed with comments like: “Really? I didn’t even know they had a university, here!”, which is not necessarily better. Finally, a loss of reputation can be expressed with sentences like “Poor devils! They even had a university here, and look at them now!”

Suffering from this effect may be both small communities (which pay the price of under-exposure – and this, we shall see, is one problem with Lithuania) and big/central communities (which pay the price of over-exposure – as in the obvious case of USA, which gathers both positive and negative SP inputs in great quantities).

Since I am not particularly interested in problematizing the issue, but rather applying it in its essential nature, I will not mention the various debates that followed Nye’s establishment of the concept: obviously – like nearly every theoretical formulation in human knowledge – SP too is subject to a fair share of criticism and controversies, but for the purposes of this article we can take Nye’s reflections as the main point of reference. In any case, one must be at least aware of the fact that SP was criticized in its general theoretical usefulness (e.g., Ferguson 2004), in its interaction with (as opposed to “difference from”) hard power (e.g., Gallarotti 2010) and in the presence (as opposed to absence) of coercive and manipulative aspects in its action (e.g., Bially Mattern 2005).

2.1. Soft power and popular music

There is no doubt that popular music is an important component of a country’s SP. Some of them have pop music as their main source: it is possibly the case with Iceland and Björk, Argentina and tango (Maradona being the main contender here), Jamaica and reggae (or, straight away, Bob Marley), and so forth. Not to mention that specific cities, otherwise not really at the centre of the world, so to speak, may become it as the result of a popular music act or event: see the cases of Liverpool with The Beatles or Woodstock with the 1969 festival (incidentally: one may say that the SP of the Finnish town of Imatra has relied for about 25 years on the fact that the International Semiotics Institute, and relative Summer School, were there).

The incidence of popular music on SP calculations can be in fact rather strong. The Institute for Government in London, UK, is actively committed in measuring this concept at global level, by using the so-called “Soft Power metrics”, which are fully explained in McClory 2012, but which basically consist of: International Purpose/Role, Cultural Output, Global Leadership, SP Icons (meaning, world-famous VIP’s who bring a positive image of their own country, like – say – Jose Mujica for Uruguay), Cuisine, National Airline/Major Airport, Commercial Brands. A great example of the centrality of popular music in such calculations is the comparison between the 2011 and 2012 charts (published in McClory 2012, in various web sources and also in the November issues of *The Monocle* monthly magazine). At the end of 2011 the first 12 countries were the following:

- 1) USA
- 2) UK
- 3) France
- 4) Germany
- 5) Australia
- 6) Sweden
- 7) Japan
- 8) Switzerland
- 9) Canada
- 10) Netherlands
- 11) Norway
- 12) Denmark

One year later, the result was this:

- 1) UK
- 2) USA
- 3) Germany
- 4) France
- 5) Sweden
- 6) Japan
- 7) Denmark
- 8) Switzerland
- 9) Australia
- 10) Canada
- 11) South Korea
- 12) Norway

Among the interesting changes, arguably the most outstanding ones are the first place of UK (against the virtually unbeatable USA), and the appearance, at the 11th place, of South Korea, not exactly the most predictable country, in charts of this kind (for the record, it was 14th, in 2011).

UK's first place was entirely due to the massive display of popular culture occurred during the Queen's Diamond Jubilee and, more importantly, the Olympic Games, with that impressive opening ceremony, which reminded the world of Britain's achievements and influence. When looking back at that ceremony, the importance of popular music in the process is plain to see: how many countries, in arranging a ceremony of that type, could count on a soundtrack composed of "Satisfaction", "Bohemian Rhapsody", "Imagine", "Heroes", dozens of others, and wrap it all up with Paul McCartney (in flesh and blood) singing "Hey Jude" to the whole world?

When it comes to Korea, if any of the readers is now thinking "No, it can't be *that!*", the explanation can be read on the same report: "South Korea made a significant jump up the rankings after a very good 2012. Korea hosted a number of global summits, historically outperformed at the Olympics, and – of course – gave the world Gangnam" (McClory 2012: 12).

Emphasis on "of course": a global one-hit-wonder is indeed able, almost single-handedly, to produce a three-place leap in a world chart of SP. In other words: the role of popular music in the determination of a country's SP is very difficult to underestimate. Matthew Fraser provides an interesting application of Nye's concept to the specific environment of popular music (Fraser 2005: 170-221), and – what matters in the present article – there is a specific passage about musical forms of protest within the Iron Curtain (Fraser 2005: 183-184). Mentioned here are the notorious access to Western pop music via the frequencies of Radio Luxembourg and Radio Free Europe, the boomerang effect of banning rock in East Germany (granting it the very attractive

status of “forbidden fruit”), the protest punk songs in Hungary during the 1970’s, and... and just when the Singing Revolution would appear as the most obvious example of the list, the book turns to a (laudable, incidentally) critique to Adorno’s inadequacy to speak of popular music (Fraser 2005: 184-185). Lithuania, the whole Baltic area and the Singing Revolution are totally missing in the picture, replaced by examples that, though very significant, were not representative of a structured, organized movement.

This, we shall see, is exactly the problem.

3. The Singing Revolution

“Singing Revolution” is a conventional name for a series of events (often, but not only, related to music) occurring between 1987 and 1991, during (and most of all as a support of) the independence movements in Estonia, Latvia and Lithuania. The term was coined by the Estonian artist Heinz Valk, who employed this expression for the first time while commenting the spontaneous mass singing of Estonian traditional songs during the Tallinn Song Festival Grounds, in 1988. Music became during those years the main expressive vehicle for conveying independentist and nationalist messages, in at least three ways: 1) specific new music was written with a distinctive (or metaphoric) political significance; 2) Traditional national music was performed for the sole fact of being “national” (as opposed to “Soviet”, or “Russian”), regardless of its contents; 3) Forbidden music, no matter what, was sung and performed as an intrinsic act of insubordination (e.g., rock genres, so despised by Soviet authorities).

The phenomenon did not take a coherent shape across the three Baltic states, and that possibly adds to the charm of it: there was no specific agreement among the three countries, but rather times were mature for a phenomenon like this to emerge spontaneously in more than one place with a similar cultural background and political condition. Nevertheless, a few events (directly or indirectly related with the Singing Revolution) were organized as a common action. Certainly, the so-called Baltic Way (another event that would deserve a clipart, to my mind), occupies a special position, here: a chain of about two million people holding hands for 675.5 km uninterruptedly from Vilnius to Tallinn, during August 23, 1989, in the occasion of the the 50th anniversary of the Molotov–Ribbentrop Pact between the Soviet Union and Nazi Germany.

The Lithuanian part of the Singing Revolution revolved around the so-called Sajūdis (“movement”), a group of 35 intellectuals and artists established in 1988 to support the perestroika and glasnost processes. Conceived as a way to modernize USSR and soften its policies, these policies had for many Soviet countries the effect of re-awakening the national consciences, and became the main catalyst for the various independence movements throughout the Union. Indeed, after the initial support to perestroika and glasnost, Sajūdis soon replaced its action with specific claims on national independence (restoring Lithuanian language, conducting campaigns of environmental protection, revealing facts and documents about Stalinism, disclosing the secret protocols of the Nazi-Soviet pact, etc.). In the turning of few months, Sajūdis had become the locomotive of the independence movement in Lithuania (for more, see Lieven 1993, Donskis 2002 and Miniotaite 2002).

Within all this process, music was an exceptionally central force. Like the other Baltic states, Lithuania had manifestations of spontaneous singing of old national songs, and composition of new (even more pinpointed) ones. Moreover, specific events, such as the so-called Rock March, took place: organized three years in a row, from 1987 and 1989 (and then in the mid 1990’s, after the independence), Rock March was a travelling show around the main cities of Lithuania, with different pop bands performing. As mentioned, one main point was not just the performance of “protest” or “national” songs (or anyway songs whose themes may have been unwelcome by Soviet authorities): it was the idea itself of performing “forbidden (that is, typically western) gen-

res” to be used as vehicle of protest. On the stages of the Rock March, Lithuanian audience could be exposed to heavy metal (through the band Katedra), punk (through the band Bix), straight rock (through the band Foje, which included the rising star and by now “spiritual leader” of modern Lithuanian rock, Andrius Mamontovas), not to mention the very peculiar case of Antis (on which I shall return in few lines). Bands from Latvia and Estonia would also appear, and that – too – was a sign: the three Baltic states were “together” in this enterprise.

The uniqueness of music, within the Lithuanian Sąjūdis, becomes even more evident when we consider that its acknowledged leader, and first president of the independent Lithuania, was Prof. Vytautas Landsbergis, a pianist and musicologist, and member of the artistic movement Fluxus (born in America, and usually known because of Yoko Ono’s and John Lennon’s involvement, but in fact founded and animated by Lithuanian artists like Jurgis “George” Mačiūnas and Jonas Mekas). Landsbergis has now become a rather controversial figure, often criticized for his aggressive and distinctive anti-Russian attitude, but in those days he was undoubtedly the most active and representative figure of the independence movement. As a musician and musicologist, one should not underrate his strong interest (in both performance and research) for Čiurlionis, himself a symbol of Lithuanian patriotism.

The list of Sąjūdis members involved in music does not end with Landsbergis: there were the composer Julius Juzeliūnas, the opera singer Vaclovas Daunoras, and most of all Algirdas Kaušpėdas, an architect-turned-to-singer, author and leader of the very influential band Antis. A true opinion leader, Kaušpėdas was behind four important stages of the Singing Revolution:

1) He was a co-founder of Sąjūdis, and one of its most proactive members.

2) He helped out resurrecting pre-Soviet Lithuanian tunes (including the national anthem, which is the one currently used), by touring Lithuania and literally asking local inhabitants (particularly elderly people) to sing them (there is a very nice sequence from Giedrė Žickytė’s documentary *How we played revolution*, which portrays him in this particular activity).

3) He co-organized and headlined the Rock March event (1987–1989); and finally.

4) He was the leader of this particular band, Antis.

Born almost as a joke, during a Christmas party, Antis became quickly a local musical sensation, one that provided the independence movement with several effective original compositions. An embodiment of post-modernism in music, Antis managed to build a powerful anti-Soviet farce through songs abounding in metaphors, allusions, double senses, parody and satire, all packaged in a very theatrical outfit, dominated by masks and costumes (themselves a metaphor of the Soviet people, forced to “appear” socially in a certain way, and having totally different needs and aspirations privately). The name itself, Antis, is a double-entendre. The word, in Lithuanian, means both “duck” and “media sensation”. So, officially the band was called “Duck”, but everybody knew that the real name referred to freedom of speech, censorship, media manipulation. Also, when directly addressed on the contents of their music (for instance, by the hosts of some Soviet musical program), the band would wear their “mask” and deliver answers such as that they were perfectly fine as every Soviet person should be. Once again: people would get the joke, and enjoy that sarcastic frontal attack to the authorities, gaining increasing confidence that independence was not anymore a utopia.

During the years of the Singing Revolution, Antis produced four albums, and nearly every song in them referred to some aspect of the Soviet oppression and “life”. As independence finally occurred, the band felt they had no longer a purpose, and amicably disbanded. Except that the demand for their music was so high (coupled with a desire, from many people’s side, to keep the memory of those feelings and values alive), that the band shortly reunited in two isolated occasions (in 1996 and 2003), and finally, in 2007, became fully-operative again, remaining still active as these lines are written (in fact, a new album was just released in 2013).

3.1. The soft power of the Singing Revolution: success of an obvious connection

There is no doubt, to my mind, that a band like Antis managed to survive without particular problems only because the perestroika was fully operating. In other times, we would be speaking of Antis as a group of heroic patriots tortured and sent to Siberia for life. Nevertheless, the ability of catching the wave of those significant historical changes is by all means a merit, and the three Baltic States were certainly in the frontline, among all Soviet countries, in these activities.

Also, there is no doubt that it was also (perhaps mostly) thanks to all the pacific and/or artistic initiatives promoted by the three independence movements that the international community became increasingly aware of the national claims of these countries, ultimately acknowledging their right to exist as independent States. Iceland, notoriously, was the first one (in February 11, 1991), then in September, USA, Hungary, Bulgaria, Italy, Poland, Malta, San Marino, Portugal, Romania, Ukraine, Latvia and Estonia followed in domino effect. On September 17, Lithuania was welcomed as a member of the United Nations along with Estonia and Latvia.

The Singing Revolution was one of the most relevant SP sources for Lithuania, in its classic sense (from one group to another), promoting the country as such (and not as a Soviet Republic), with all its values, characteristics, customs and choices. Being what it was (that is, a musical phenomenon), it certainly was particularly effective in raising international sympathies. To paraphrase Žickytė's documentary, the revolution was not made, fought, organized or else. The revolution was "played". Few other strategies could have been as powerful as this one, once we are comparing a 3-million-people country against a country 260 times bigger and 50 times more populated.

On the other hand, even more decisive in the independence process was the other important function of SP we mentioned above, that is, the one that operates on the same community it is generated within. Possibly more than any other action taken during the Sajūdis, the Singing Revolution was for Lithuanians the strongest reminder of what they used to and wanted to be: an independent country, with those values, that flag, that language, that identity. And those songs, of course. Leonidas Donskis goes as far as to define the Singing Revolution (and Sajūdis in general) as the ultimate Lithuanian embodiment of the "generous and noble-spirited traditions of the Romantic ethos of liberal nationalism" (2002: 2), up to become the actual highlight of Lithuanian recent history.

3.2. ...and failure of an obvious opportunity

Given such "epic" value of the phenomenon, it is sadly remarkable to notice that neither Lithuanian authorities nor specific scholars have devoted anything more than a minor effort to study, analyze and promote the events and repertoires of the Singing Revolution. The whole phenomenon, as such, is very seldom mentioned in books and essays dealing with "protest songs" or generally the relation between arts and politics. No Lithuanian singer or songwriter does ever appear as the "Lithuanian Pete Seeger" or the "Woody Guthrie of the Baltics". No edition of the Rock March is ever presented to the international readership as a "Lithuanian Woodstock".

Certainly, it is not irrelevant that the entire movement (Antis, first and foremost) was animated by a rightist-conservative intelligentsia. The studies on protest songs (and, to say it all, the whole area of popular music studies) is literally dominated by leftist scholarship, most members of which still having one or two issues in admitting that also Soviet Union was a dictatorship, and that – therefore – a democratic protest can also originate from the right side of the political spectrum. Let alone music *per se*, where the notion of "protest" seems to be possible only if a songwriter plays a guitar with the inscription "This machine kills fascists".

The second problem is that popular music studies are no less alien to ethnic and cultural biases than traditional musicology. If studies on classical music are infamously euro- and male-

centric, popular music studies are glamorously Western- and particularly Anglo-American-centric. To make a specific example related to protest songs, Phull 2008, analyzes 52 supposedly historically-crucial protest songs, with the suspicious result that only two of them are not from either UK or USA: The Wailers' "Get Up, Stand Up" (Jamaica) and Nena's "99 Luftballons" (Germany). Let alone the Baltic States, but the fact that songs like "Senzeni Na?" (a sheer anti-apartheid anthem in South Africa) or Inti Illimani's "El Pueblo Unido" have to be ignored to give room to Michael and Janet Jackson's "Scream" or Pulp's "Common People" (no disrespect meant: I am only pointing out the historical relevance of these songs within any movement of political protest), is only another confirmation that before criticizing the (many) biases of traditional musicology, popular music studies should take a serious look at their own.

Having said that, the rest of the responsibilities falls entirely on Lithuanian cultural policies and their operators. At national level, there are a few (not even many) studies written in Lithuanian: then, as we move into the field of international exposure of such an important phenomenon, emptiness dominates. No Lithuanian scholar has ever bothered to write a history (or an analysis) of the Singing Revolution in English. Other cultural objects, too, are generally missing from the picture. Two Lithuanian movies (the mentioned documentary *How we played the revolution*, and a fiction film called *The Children from the Hotel America*) address the topic of the Singing Revolution, and they were also presented in film festivals abroad (therefore, English subtitles do exist!): but when the DVDs were released, no English subtitles were anymore featured, preventing the items to have any impact whatsoever on the international market (in other words: taking for granted that they will not).

Moreover, very timid were the attempts to academically promote the Singing Revolution at international level, resulting in international ignorance and misunderstandings. Thomson 1992 (not exactly a Lithuanian surname, as one can notice) remains the most evident international exposure of the phenomenon, otherwise the only Baltic country that really took proper care of this enormous cultural heritage was Estonia (in particular through such studies as Vesilind 2008). In Estonian cultural policies and scholarship, the Singing Revolution is seen as a major event, one that not only contributed to the country's independence, but which in fact typifies it. Research and promotion of the phenomenon take special care in making it internationally visibly, with publications and documentaries in English, plus – what is more significant – the inclusion of the Singing Revolution as a founding historical event in nearly any general treatise of Estonian history and/or culture. There is a far cry between two similarly-titled and similarly-intended books like the mentioned Donskis 2002 (*Identity and Freedom: Mapping Nationalism and Social Criticism in Twentieth-Century Lithuania*) and Subrenat 2004 (*Estonia: Identity and Independence*). Lithuanian "identity", for Donskis, results in one single mention to the Singing Revolution (the one quoted above, which ironically celebrates its importance); Estonian "identity", for Subrenat, is an entire chapter called "The 'Singing Revolution' and Independence Regained".

Finally, if this (lack of) literature review was an award, the winner in the category "best missed opportunity to talk about the Singing Revolution" would probably be Miniotaite 2002. The amazing fact, here, is that this book is programmatically written to talk about the "nonviolent resistance" in Lithuania:

This monograph seeks to highlight the important role that nonviolent action has played in Lithuania, especially in the reassertion of independence in the 1980s and 1990s. [...] I seek (...) to draw attention to an often ignored strand of the Lithuanian experience, one that – given greater understanding and development – could help diminish the prospect of a recurrence of such destructive national and communal violence. (Miniotaite 2002: 7).

The book that has the perfect historical and thematic frame to discuss the Lithuanian Singing Revolution, devotes no more than five (!) lines in the whole text (pp. 30 and 31) to any topic related to the Singing Revolution: the organization of the first “Rock March” (erroneously called “Rock’n’Roll March”, among other things: as if Bix and Katedra came to play “Tutti Frutti” and “Blue Suede Shoes” instead of punk and metal).

As a result, little by little, the Singing Revolution is turning from a Baltic into an Estonian-only phenomenon, and, needless to say, this is also what the international community, by reflex perceives (e.g., the Canadian documentary *Cultures in conflict* focuses entirely on the Estonian Singing Revolution, with basically no mention to Lithuania and Latvia). Latvia has recently made a significant step, with the publication of *Smidchens 2013*: by now, thus, Lithuania remains the only country not to have properly presented its contribution to the Singing Revolution to the international community.

Lithuania therefore experiences at least three of the above-mentioned boomerang-effects of this potentially-outstanding SP resource. In international communication (“from one group to another”), we witness a clear “lack of reputation”: quite simply, most people ignore that such a thing like the Singing Revolution ever happened in Lithuania. In internal communication (within Lithuania), we witness at the same time an “absence of the resource” and a “loss of reputation”: respectively, the Singing Revolution is underrated or even overlooked in its SP potential, and – more and more often – a general feeling of “those glorious days of true national spirit are over” is spreading among the Lithuanian community, in response to a perceived crisis of cultural and moral values.

The present article, and the whole work of the research project mentioned in the first footnote, are meant as a small contribution to fill this gap.

Note: This article is part of the project “Music and Politics: An Analysis of Protest Songs and Lithuanian Singing Revolution”, funded by a grant (No. MIP-14172) from the Research Council of Lithuania.

Abstract

La danse constitue l'un des rites le plus important des ethnies Irlandaises. Cette tradition culturelle et rituelle en tant que l'héritage national du peuple iranien bénéficie de nombreux aspects qu'on peut les analyser de différents points de vue. Face à cette activité socioculturelle qui témoigne d'une présence mythique, le danseur et la danseuse présentent un parcours historico-culturel relatif au vécu, aux mythes, aux croyances et aux principes rituels et ethniques. En effet l'ethnie Qachqâ'i, située au sud de l'Iran, profite de la danse pour donner un caractère esthético-affectif aux pratiques dures de la vie quotidienne. Ainsi, cette danse s'attribue une fonction discursive qui réconcilie le faire et l'être. Comme objet culturel, la danse contribue à la production d'un métalangage qui redistribue les tensions mise en place lors des pratiques journalières à partir d'une énonciation pluridimensionnelle : ce qui donne lieu à une synesthésie du sens. Tout

en prenant source dans des motifs divers, la danse Qachqâ'i nous met devant un univers figuratif à travers le corps et le geste. Elle devient alors la source de la signification à travers des pratiques de la vie quotidienne comme les rites, la tonte des moutons, les activités agricoles, l'équitation, les combats et la résistance face à des tributs envahisseurs. Une telle danse a donc la capacité de souffrir des propriétés existentielles comme autant de possibilités de sens.

Dans cet essai, notre objectif consistera à rendre compte du caractère perceptivo-somatique du discours de la danse Qachqâ'i en tant que l'espace de la transformation des tensions quotidiennes en interaction trans-narrative. Nous nous intéresserons ainsi à examiner le caractère sémio-culturel de la danse Qachqâ'i afin de nous rendre compte du passage des pratiques quotidiennes au discours méta-narratif comme un héritage culturel.

Mots clés: la danse Qachqâ'i, le faire et l'être, le corps, la trans-narrativité, héritage culturel

1. Introduction

Face à cet élément socio-culturel dans lequel on peut trouver beaucoup d'aspects mythiques ; le danseur et la danseuse présentent un ensemble historique relatif aux mythes ; aux croyances et aux principes rituels et ethniques. De plus la danse à côté de la musique et du à son caractères divertissant ; gai et réjouissant qui vivifie la vie dure de clan ; se considère comme objet d'art exprimant l'état d'âme. Donc la danse se prend une fonction discursive qui montre les passions et les sentiments des membres de clan.

Aucune étude n'a jamais été consacré à l'analyse sémiotique de la danse Qachqâ'i en tant qu'une sorte de danse folklorique iranienne ; ce qui exige le problématique de recherche. Comme le point de départ ; nous avons déjà choisi un parcours anthropologique afin qu'on puisse poursuivre la vie et les coutumes des clans Qachqâ'i tout au long de l'histoire. Donc, à l'aide d'une méthodologie analytique-descriptive ; on a essayé de présenter un panorama historico-culturel de la vie des nomades Qachqâ'is. Après avoir introduit les différents aspects de cadre théorique, nous allons analyser la danse Qachqâ'is dans toutes ses dimensions sémiotiques qui montre comment ce type de danse avec toutes ses propriétés sémioculturelles se lie aux pratiques journalières de cette ethnie iranienne. Nous nous intéressons donc à répondre à deux questions principales de cette étude. Premièrement, on va répondre à cette question que la danse Qachqâ'i appartient –elle à quel genre discursive ? Et deuxièmement, La danse Qachqâ'i comme objet et identité culturelle, contribue de quelle manière à la production des sémio sphères qui témoignent des propriétés culturelles?

2. Contexte théorique

2.1. Les figure du corps (La figurativité, la gestualité) de la danse

Les premières études sur la gestualité de de point de vue sémiotique résultent de la notion de corps propre de Merleau Ponty et aussi la théorie de l'énonciation fondée par Jakobson et Benveniste. Dans le sens le plus général du terme ; la danse est certainement une affaire de signification. Comme on le sait ; la mission de la sémiotique n'est donc pas de dire ce que quelque choses signifient mais la manière dont les choses signifient. Dans ce sens, la danse ; elle-même, elle s'agit de découvrir quelle est la manière spécifique dont celle – ci organisent significations. Judith Hanna (1977: 215) insiste sur ce fait que la danse s'articule doublement. En fait , la différence entre les unités porteuses de signification et celles qui servent seulement à les séparer, n'existe plus dans la danse que dans l'image .Pour l'image, ce n'est que l'ensemble de la figure qui a une signification et que celle- ci redistribue aux composants , en tant que la figure , pour la danse c'est le geste ou la gestualité qui a la signification .

Comme le système de la langue formé à la base des unités d'expression et de contenu, les figures du corps aussi sont les ressources sémiotiques dans le cas de la danse. Le geste et le mou-

vement font partie du contenu de la danse (Ekman 1969 : 87). Pour la danse Qachqâ'i, Le mouvement des pieds et des bras qui se croisent sont les gestes significatifs. Les bras qui se croisent et leurs mouvements itératifs qui sont liés aux pratiques et à la monotonie de la vie des nomades Qachqâ'i ne font pas aussi l'exception de cette affaire. Ce sont ces gestes et ses mouvements qui sont comparable dans ce respect aux signes linguistiques ; à savoir des signes dont l'expression et le contenu ont été seulement réunis parce que nous savons qu'ils doivent aller ensemble et non pas à cause d'une proximité ou la similarité.

En émettant l'hypothèse que la danse se constitue comme plus pertinente parmi tous les autres éléments possibles de clan Qachqâ'i, c'est par une définition très générale que nous amorcerons un travail réflexif sur le geste et le sens dont il est potentiellement porteur. Ce travail relevant essentiellement d'une approche sémio -culturel. Renvoyons à ce qui peut être qualifié de geste, tout phénomène sensible (visible, audible, etc.) manifesté par le corps humain - tout ou parties (segments) - qui se déplace ou non dans l'espace. Ce phénomène est signifiant pour celui qui le perçoit. Le corps qui manifeste un geste peut être virtuel (iconographie, vidéo...) ou réel. (Genette, 1994 : 27).

Greimas (1970: 56 [Fontanille ,2004:82) affirme que de nombreux mouvements prenant leurs origines dans le corps humains ont pour but de changer le monde d'une façon ou autre ou de réorganiser la réalité de telle façon que la réorganisation peut être utilisé à l'avantage du sujet – opérateur ; c'est ce qu'on peut aisément trouver dans le cas des croisements des pieds et des bras et la gestualité lors de danse chez les nomades Qachqâ'is . Ici le cercle des danseurs est coupé en deux dans le prolongement du torse vers le coté séparant l'espace intérieur devant de l'espace extérieur. Or si ce discours continu de la gestualité nous accompagne dans les pratiques quotidiennes des nomades Qachqâ'is , on comprend plus facilement comment libéré de ce contexte ; il peut devenir un type de danse qui a ses propres valeurs culturelles qui ne le partage jamais avec les tribus qui l'ont entourés.

2.2. Les différent gestes et figures du corps de point de vue sémiotique

Tout d'abord en parlant de la gestualité et du geste comme Rastier insiste-t-il , il faut distinguer entre un comportement humain significatif et un comportement humain non significatif, en posant les conditions préalables selon lesquelles « un comportement peut être considéré comme porteur de signification ». Suivant Hjelmslev, pour Rastier un comportement est significatif s'il peut être interprété comme le plan d'expression d'un langage (articulé) qui se pose en une relation de présupposition réciproque avec un plan du contenu (a son tour articulé). Etudier la signification du comportement humain veut dire identifier ses unités d'expression et ses unités du contenu, mais aussi, surtout, leur relation nécessaire. Tout ce qui ne correspond pas à ces caractéristiques n'est pas signifiant, et il ne pas être l'objet d'étude d'une sémiotique des gestes. Cette délimitation ne repose pas sur des critères externes au champ d'analyse (communication intentionnelle vs mouvements involontaires du corps ; gestes vs pratiques), ou sur des présupposés implicites cachés au moment de l'analyse même (signes artificiels vs signes naturels ; comportement mythique vs praxis quotidienne), mais sur des conditions scientifiques explicites, communs à tous les langages. De cela dérive que le comportement non significatif « comprend le comportement pratique et le comportement réflexe, c'est-à-dire tous les comportements non symboliques (Greimas , 1968 : 81-82).

L'enjeu d'une sémiotique générale visant à considérer le rôle des gestes dans l'action humaine signifiante serait, au contraire, de sortir de cette tradition, en affirmant l'importance fondamentale de la production, de la praxis, pour la constitution des cultures. Au-delà de ces questions philosophiques plus générales, cette approche comporte de conséquences théoriques d'une certaine importance : l'idée d'une irréductibilité du geste au langage verbal (ce qui est en contraste

avec la tradition pensant les gestes comme simple support de la verbalité) et celle, encore plus fondamentale, d'un élargissement de la notion même du langage, compris non plus comme communication, mais comme production (s'opposant à la vision fonctionnelle des langues comme des simples instruments pour la transmission des informations). Loin d'être considérée comme un accompagnement inessentiel à la communication verbale, la gestualité acquiert le rôle d'une activité antérieure au message représenté et représentable, un travail qui précède la constitution même du signe et des mots, une activité qui fonde la possibilité même de désignation qui sera propre aux mots. En définitive : toute gestualité est une pratique.

Pour répondre à toutes ces questions Greimas pose la sémiotique du monde naturel. Chez lui ; La langue est une forme – ou mieux, l'enchevêtrement de deux formes – indifférente à la substance dans laquelle elle se trouve manifestée ; si la substance est une variable et la forme une constante, toutes les substances (en tant que formées sémiotiquement) peuvent être chargées de manifester des expressions et des contenus ; pas seulement la substance sonore (celle manifestée dans l'oralité) ou la substance graphique (manifestée dans l'écriture), mais toutes les substances du monde, c'est-à-dire toutes les façons sensibles par lesquelles le monde se manifeste à nous par notre appareil sensoriel (par notre corps) : des façons visuelles, tactiles, sonores, olfactives, sensorimotrices etc. (Greimas, 1970 : 99-100).

En d'autres mots, le monde est 'naturel' à la même manière des langues dites naturelles : constructions culturelles par lesquelles des formes d'expression se posent en présupposition réciproque avec des formes de contenu. La différence entre les langues ('naturelles') et le monde ('naturel') est une question de substance, pas de forme ; une question donc indifférente à la production, culturellement et historiquement déterminée, de la signification humaine. 'Naturel' veut dire donc, en ce contexte théorique, quelque chose comme 'habituel', déjà donné le sens commun quelque chose que l'individu se retrouve au moment de son appréhension subjective de ce qui l'entoure (Greimas et Courtés 1979: 233).

Comme on lira dans l'entrée « Monde naturel » du Dictionnaire de Greimas et Courtés : "Nous entendons par monde naturel le paraître selon lequel l'univers se présente à l'homme comme un ensemble de qualités sensibles, doté d'une certaine organisation qui le fait parfois désigner comme 'le monde du sens commun'. Par rapport à la structure 'profonde' de l'univers, qui est d'ordre physique, chimique, biologique, etc., le monde naturel correspond, pour ainsi dire, à sa structure 'de surface' ; c'est, d'autre part, une structure 'discursive' car il se présente dans le cadre de la relation sujet/objet, il est 'l'énoncé' construit par le sujet humain et déchiffirable par lui."

En reprenant certains passages de la philosophie phénoménologique de M. Merleau-Ponty et de l'anthropologie structurale de Cl. Lévi-Strauss, et en s'accordant aux propositions sur la typologie des cultures avancées dans les mêmes années par I. Lotman, pour Greimas la différence entre nature et culture doit être pensée comme une construction humaine différente selon les cultures, une délimitation orientée entre ce qui est *dedans* chaque culture et qui ne l'est pas, qui reste *au dehors* d'elle. Voulant utiliser les catégories explicatives du carré sémiotique (proposées aussi dans *Du sens*), on pourrait dire que, avant d'être une Nature, cette entité doit passer par le stade de la Non-Culture (d'une négation qui précède – comme toujours – l'affirmation). Nature et Culture, sorte de universaux sémantiques collectifs, construisent une opposition de base à l'intérieur de chaque culture, variable dans l'espace et dans le temps, par laquelle chaque culture peut articuler ses signes, ses langages, ses attitudes signifiantes, ses codes. (Marrone 2006 : 7)

On comprend pourquoi la notion Greimassienne de monde naturel dérive justement d'une enquête sur la gestualité. Les gestes, au moment où se bâtissent en systèmes de communication parmi les hommes, articulent les parties et les mouvements du corps dans un espace qui l'entoure. Mais la sélection de ces parties et ces mouvements (en tant que substances d'expression de la communication gestuelle) n'est pas totalement autonome : elle se base, précisément comme

le feu vert de Lévi-Strauss, sur des morceaux de significations pr existantes, sur des signes déjà faits, sur des figures chargées de sens possibles. Par ex. l'opposition lourd/léger que la danse utilise pour produire ses significations, a déjà des valeurs dans le monde naturel, la légèreté étant euphorique et la lourdeur dysphorique (ou vice versa).

Pour cette raison, dit Greimas, il ne faut pas confondre la praxis somatique (qui est un affaire de pratiques énoncées par des sujets d'actions, des corps en mouvement) avec la communication gestuelle (qui est, au contraire, un fait d'énonciation produite par des corps-émetteurs pour des destinataires qui l'interprètent). Dans le premier cas, c'est un problème de sens comme direction : la signification des actions corporelles. Pour Greimas il faut remarquer que le corps peut signifier à deux niveaux différents, celui de l'énoncé et celui de l'énonciation : « dans la praxis gestuelle, l'homme est sujet de l'énoncé, tout en étant un 'il' pour nous, il est le 'je' agent de l'énoncé, le sujet des fonctions qui constituent son comportement; dans la gestualité communicative, l'homme est le sujet de l'énonciation : il est un 'tu' pour nous, mais un 'je' pour lui-même, dans la mesure où il cherche désespérément à produire et à transmettre des énoncés(Fontanille, 2004 :239) .

Denis Bertrand (2000: 159) a montré pourquoi la synesthésie pouvait être interprétée comme une incomplétude éprouvée conduit à la synesthésie. Dès lors ; celle-ci est d'emblée décrite comme un mouvement à travers les diverses sensations composant une expérience : l'incomplétude suscite une tension qui demande résolution et cette résolution consiste à traverser tous les flux sensoriels pour y trouver réponse au manque qui existe. La synesthésie n'est plus alors qu'un cas particulier du se mouvoir ; le mouvement perçu réflexivement ; c'est – à dire la sensorimotricité devenant quant à elle le prototype de toute intentionnalité. Le support de toutes les visées de complétude ; le principe mémé de toute liquidation d'un manque figuratif.

3. L'espatialité

D'après Fontanille(2004: 80) , on peut discuter de deux espaces dites figuratif et figural. Tandis que le premier met l'accent sur la discontinuité des espaces où les sujets se situent et qu'ils trouvent leur significations d'après deux éléments qui s'appellent la contiguïté et la coordination ; le deuxième est un espace continu et dynamique étant indépendant des sujets et leur effets sur les distances spatiales significatives. Ici l'être ou bien la présence ou co-présence des sujets cause de passer de l'espace continu à celui de discontinu. De plus comme Tarasti (2009 : 36) insiste, la transcendance d'espace cause le dynamisme de l'espace .Nous pouvons simplement voir la réconciliation de faire et de l'être ; ce que nous oriente vers les propriétés existentielles comme autant de possibilité de sens. Comme on le sait tous ; chaque espace dépend à son tour de l'identité de sujet, chaque espace forme une identité spatiale / significative / affective/ ontologique et perceptivo- affective.

4. Analyse sémiotique de la danse Qashqâ'i

Dans cette partie à l'aide de photos qui témoignent la scène de la danse Qashqâ'i, nous avons partagé la scène de danse à quatre espaces ou dimensions ayant beaucoup de possibilité sémiotique qui sont liés aux pratiques journalières de cette ethnie connu iranienne. D'après Shairi et Fontanille (2001: 87), si le discours verbal est capable de nous conduire partiellement et indirectement de l'énoncé vers l'observé et la chose vue ; l'énoncé visuelle ne se donne à saisir qu'en tant que l'observé. La sélection ; le point de vue, la lumière, le cadre, la distance sont tous significatifs pour la correspondance de photo avec la chose vue. De point de vue sémiotique, la photo est l'empreinte de quelque chose qui est resté sur la surface (Floch 1986). L'empreinte nous oriente vers la présence de quelque chose que lui – même est absente. Le regard par intermédiaire de présence absente donne une présence existentielle et dynamique. Tel type de regard obéit non seulement des valeurs culturelles mais aussi obéit des valeurs dont chacun s'occupe dans sa

propre culture.

Les photos qui montrent une scène de la danse Qachqâ'i sont de type référentielles et photo-témoin. Elles essayent de montrer la réalité existante de la danse chez cette ethnie. Alors on peut aussi les considérer en tant qu'une sorte de documentation. Elles seraient aussi les photos artistiques ; car pour leur production, on ne peut jamais nier le rôle de la lumière/ la perspective et le cadre (Zilberberg , 2006 :34). A côté d'avoir la fonction référentielle, les photos qui représentent une scène de la danse Qachqâ'i ne sont pas seulement au service de documentation avec la fonction référentielle. Ces types de photos peuvent créer un discours visuel. Elle peut attirer l'attention de l'énonciateur. Ici la relation établie entre le sujet et la scène se fait importante. Donc la réalité de photo n'a pas autant de valeur ; à l'inverse, la vision de sujet ou de l'énonciateur qui est dirigée vers le monde a de préférence.

4.1. Dimension narrative

Cette entrée linéaire dans un ordre observable correspond à une situation aspectuelle inchoative qui signifie un début de pratique quotidienne. Cette pratique représentée ici par un gestuel esthétique – éthique correspond à une stabilisation métaphorique des situations et des scènes de la vie.

Figure 8 : Entrée linéaire sur la scène correspond aux pratiques journalières de clan

4.2. Dimension éthique

L'étape suivante est le passage à une explosion de l'ordre où les danseuses se dispersent et s'occupent tous les points de l'espace. Cette explosion somatique est en rapport avec une forme de vie particulière chez les nomades qu'on peut appeler le soi ou soi tout en appartenant à l'autre. En fait le corps nomade est un corps situé d'une part entre les autres corps et signifie par ces autres corps .Et de l'autre ; le corps tout en existant pour l'autre existe pour soi dans l'exacte mesure où il donne à son propre parcours une situation actualisée ça veut dire, le passage à une extension spatiale avant de faire l'expérience d'une situation d'intensité où il se place dans une interaction contracté.

Figure 9 : Explosion somatique sur la scène

Toute action sur la scène de danse Qachqâ'i pratiquées de la part des nomades est une action pour l'autre et qu'elle s'accomplit en présence de l'autre et dans un mot la scène nous présente la co- présence des corps. La continuité de la vie des nomades dépend des actions collectives où l'autre devient un figure symbolique ; ce qui garantit l'existence collective ; ici nous voyons que la scène de la danse Qachqâ'i profite des aspects éthiques.

4.3. Dimension existentielle

La culture des nomades Qachqâ'i connaît des moments de durcissement dans les espaces contractés ainsi que des moments décontractés où le corps vit une liberté existentielle .Le suivi des corps témoigne d'une situation de partage des tâches journalières ; ainsi que d'une interrelation effective et pragmatique. En plus, le parcours linéaire au début est repris à la fin. Cette sortie linéaire fait part d'abord du résultat et de la terminativité de la scène et de l'autre ; du recommencement et reprise des pratiques.

Figure 10 : Contraction spatiale (le regroupement des corps)

Figure 11 : Décontraction et dispersion des corps

4.4. Dimension phénoménale

La symbolisation et la métaphorisation des pratiques de la vie à partir des gestuels scéniques et théâtraux montrent que la vie nomade vit une continuité pratique d'ordre esthétique et artistique à fin d'honorer une existence qui débute dans l'action journalière et qui se verse dans une représentation phénoménale. On pense que ces danses ont leur origine dans l'imitation des actions des femmes au cours de leur vie quotidienne, telles que le tissage, le filage et d'autres activités.

4.5. L'espatialité et la contribution de la danse dans la production des sémio- sphères culturelles.

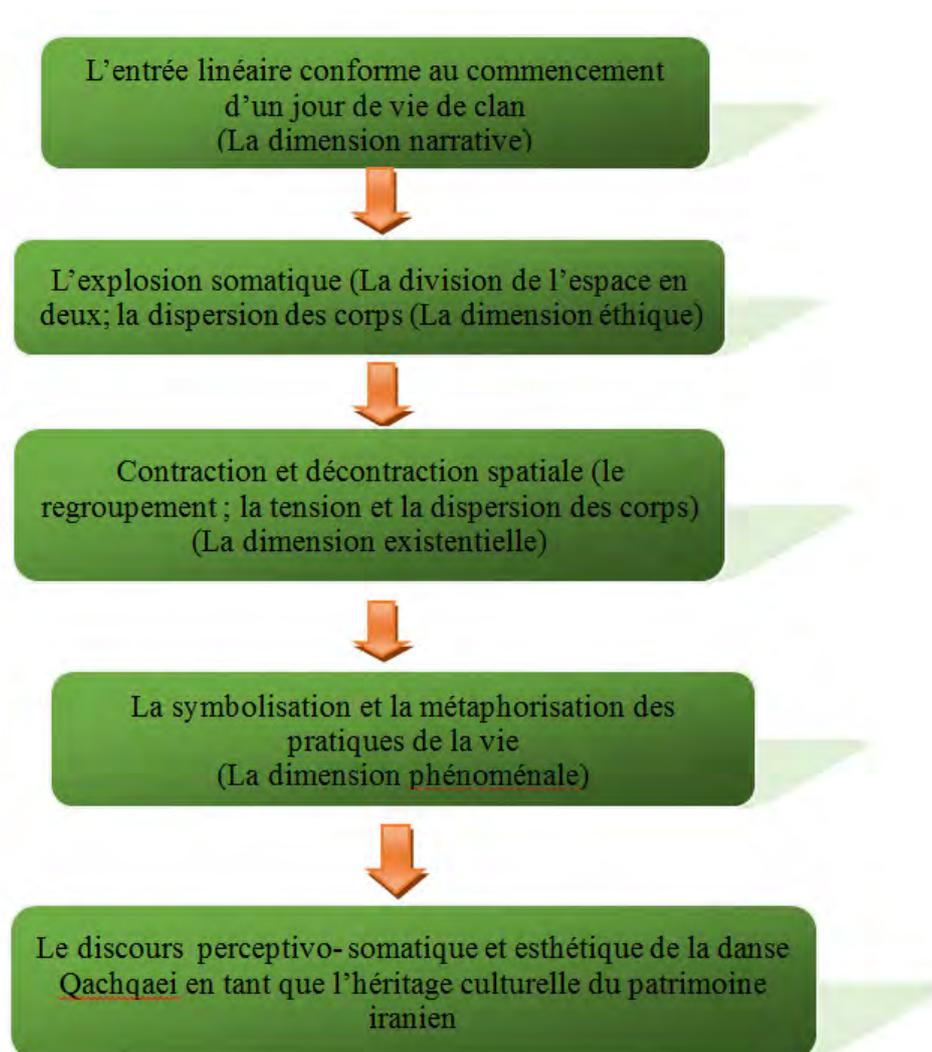

L'espace de la danse Qachqâ'i est continu. La danse Qachqâ'i forme à son tour un espace narratif et continu avec les propriétés pragmatiques qui sont liés aux pratiques journalières de cette ethnie : ce parcours ou bien ce programme narratif trouve sa signification en présence des sujets collectifs. De plus ; la danse dans la nature est parfois transformée à une méta- narration ou trans-narration dans laquelle les sujets ne sont pas obligés d'obéir une logique actionnelle ; ce qui constitue d'après (Landowski 2010). Les espaces pragmatiques sont exigeants et obligatoires car le sujet ne peut jamais les changer ; ou les passer ; il se trouve en conflit avec eux volontairement. Ici nous pouvons parler d'un espace embrayé. Dès que le sujet se situe dans cet espace ; avec sa présence ; il cause une sorte de distinction en comparaison avec les autres. L'espace de la danse Qachqâ'i nous présente une organisation spatiale spirale ; ceux que Landowski les définissent en tant que les espaces qui sont en constante interaction avec le monde ou la nature qui les entourent. Ici ; La multiplicité de l'espace s'avère significative. La danse accompagnée de musique rend aussi l'espace poétique. Donc ; la nature où les nomades Qachqâ'is vivent se fait un espace en devenir. Ce qui était présent devient encore présent .Celui – ci donne un caractère étatique à l'espace. Il se situe à l'intersection des mouvements ; ça veut dire l'ensemble des gestes et des mouvements qui se forment et qui vivifient l'espace. (Lotman1999: 64). A partir de cette étape chaque élément spatial peut se déplacer dans la sémio-sphère concernée. Il est à noter que la production de signification de la part de la danse des nomades Qachqâ'is n'est pas exclusivement limitée au temps actuel ; mais on doit la chercher dans toute l'histoire de cette ethnie.

La danse Qachqâ'i appartient à la mémoire historico- culturelles du patrimoine iranien toute en s'attribuant une fonction esthétique. La scène de la danse Qachqâ'i s'inscrit ainsi son identité

par rapport à d'autres ethnies. Telle scène pourrait réserver sa fonction pragmatique. Dans ce sens ; l'espace se multiplie et son identité historique et diachronique devient synchronique. (Lotman 1999: 15). ça suffit de voir les danseurs Qachqâ'is sur le plateau d'un festival international des danses ethniques. Ce fait est tout à fait conforme à la notion posée de la part de Lotman ; la sémio- sphère, car la narration réalisée des pratiques journalières est transformée à l'espace de la danse avec toutes les propriétés sémiotiques ; ou bien l'empreinte d'une narration dans d'autres narrations : ce qui est connu en tant que la trans- narrativité.

5. Conclusion

En termes de conclusion, il est à noter que comme un objet culturel ; la danse Qashqai, elle-même ; contribue à la production des sémio- sphères qui témoignent de la propriété culturelles des uns et des autres ; ce qui se justifie par rapport à l'intégration de soi par soi dans le discours de la danse afin de dialoguer avec d'autres types de danse et de s'inscrire dans son espace. Donc ; tout au long de cette recherche, nous avons essayé d'examiner les propriétés sémioculturelles de cette danse dans son propre espace ethnoculturel. A la fin de cette recherche on a déjà schématisé la structure de ce discours artistique.

LE TAPIS PERSAN : FIGURE, MATIERE, PRATIQUE DISPOSES A FAIRE SENS

Hamid Reza Shairi, Université Tarbiat Modares, Iran
Shairi@modares.ac.ir ; shairih@gmail.com

Résumé

Les tapis persans sont des objets sémiotiques dont la signification dépend de leur capacité de la discursivité. Tout au long de cet essai nous nous occuperons de deux types de tapis : tapis en soie et tapis en laine. Nous traiterons ces tapis comme des objets qui animent d'une manière ou autre nos demeures. Comme objets du design, ils participent à organiser notre espace et à remédier notre rapport au monde. Comme objets domestique, ils s'inscrivent dans la loi de la transitivité et s'appêtent à devenir des objets pratique ou esthétique. Comme objets d'art, ils prennent leur distance par rapport à l'observateur, s'imposent de loin, nous envahissent, font autorité sur nous, mais ils n'hésitent pas en même temps, à provoquer notre contact direct et corps à corps. Comme objets culturels, ils contribuent à la production des espaces partagés ou discrets. Et enfin comme objets socio-éthiques, les tapis deviennent le lieu de la mise en place des rapports de force : il s'agit d'une tension entre le survenir et le parvenir.

Ainsi, relevant d'un caractère tridimensionnel, les tapis persans constituent un univers de sens très compliqué et partagé entre la figure, la matière et la pratique. Contenant pour certains des textures très fines et pour d'autres des textures moins fines et même épaisses, les tapis font sens à partir de leur matériau en soie ou en laine. Or, le matériau est responsable d'une partie de la signification. Et enfin, se prêtant à des pratiques diverses selon les cultures, à des manières de vivre et aux expériences perceptivo-affectives des usagers, les tapis deviennent source de significations et tendent à s'offrir des formes de vie comme autant de possibilité de sens. Cet essai aura donc pour objectif de rendre compte du caractère multidimensionnel du discours de tapis persan afin d'examiner et de voir de quelle manière il affecte notre rapport à nous-mêmes et au monde.

1. Introduction

Le tapis persan se caractérise par deux sortes de force : immanentiste et transcendantaliste. Ces forces proviennent elles-mêmes des formes de vie qui dépendent du matériau et de la figure déterminant les manières de vivre des tapis. Pour le tapis en soie, nous avons affaire à une forme de vie en retrait, mais esthétique ; et pour le tapis en laine, nous sommes en présence d'une forme de vie partagée et mise en pratique. Cependant, est-il possible de voir un changement concernant le mode d'existence du tapis-soie ? Nous avançons l'hypothèse selon laquelle l'intervention du matériau peut modifier la présence du tapis-soie : par une projection dans notre monde, il abandonne son univers discret et autosuffisant et réajuste sa position. Mais, il est aussi important de savoir par quelle procédure, le tapis-laine - privé de la brillance et caractérisé par une figure mate et en retrait - peut se doter d'une forme de vie partagée. Ainsi notre deuxième hypothèse est centrée sur le fait que le tapis en laine bénéficie du domaine du toucher et invite donc l'utilisateur à devenir son partenaire à partir d'une interaction somatique. Ce qui signifie que les deux corps s'inscrivent dans une activité interrelationnelle changeant la profondeur matérielle en profondeur humaine.

2. Valeur d'usage et valeur de base dans les tapis persans

Le tapis persan est un objet pluridimensionnel par ses aspects pratiques, esthétiques et éthiques. Il est d'abord un objet fonctionnel par le simple fait qu'il s'inscrit dans une relation d'usage quotidien. Son intrusion dans nos demeures renvoie à un certain rapport de fonctionnalité : pour couvrir une surface, pour s'asseoir ou pour faire la prière là-dessus. Mais cette valeur d'usage confronte rapidement à un autre type de valeur que J. M. Floch considère à juste titre comme « utopique » (Floch, 1986 : 16-17). En effet, le tapis persan entre d'une part dans une dimension esthétique qui consiste à décorer nos maisons, à nous conduire de la nature à la culture ou même de nous faire rêver par un certain rapport de force esthétique, et il se dote de l'autre, d'une qualité mythique qui témoigne de son caractère sacré. Il faudrait en outre ajouter à ces deux dimensions de force de tapis une troisième interprétable comme un aspect esthético-éthique : la capacité de transformer nos intérieurs en un lieu d'exposition. C'est ce qui nous conduit à attribuer aux tapis deux valeurs d'usage et de base. Tout ceci offre à cet objet de signification une certaine épaisseur qui l'élève au rang d'un objet s'inscrivant dans un plan de la praxis énonciative. A croire Greimas :

La chose devient un objet de valeur syncrétique. Doté de mémoire, collective et individuelle, porteur de signification à facettes multiples qui tressent les réseaux de complicité avec d'autres objets, pragmatiques ou cognitifs, l'objet s'insère dans la vie de tous les jours en lui ajoutant de l'épaisseur. (1987 : 91).

Tout au long des parties qui suivent, nous allons essayer de nous concentrer sur ces diverses dimensions dont bénéficie le tapis afin de montrer de quelle manière un objet d'usage peut s'élever au rang d'un objet utopique investi des valeurs esthétique et en devenir.

2.1. Usage et temps créent une valeur-temps pour le tapis

L'une des particularités du tapis persan consiste dans le fait d'assigner à l'usage un contenu temps qui change le rapport à la fonctionnalité. A ce sujet deux temporalités s'avèrent importantes : la première appartient au niveau de la production et la seconde s'approprie le niveau de la consommation. C'est ce qui nous introduit dans une valeur-temps.

La valeur-temps transforme le tapis de consommation considéré comme objet de valeur d'usage en un objet de valeur de base, puisqu'elle lui assigne un contenu : ancienneté. Ce qui signifie que l'usage lui-même est producteur d'une valeur-signe qui s'intègre au fur et à mesure dans l'objet jusqu'à ce que celui-ci devienne le lieu d'investissement d'un contenu-temps qui modifie le rapport du propriétaire du tapis à lui-même et au monde. Tout en se servant du tapis, son propriétaire sait que le passage du temps est un facteur positif qui fait évoluer l'axiologie première grâce à laquelle on reconnaît le pouvoir représentatif du tapis en une axiologie seconde fondée sur l'ancienneté. Ainsi, une nouvelle force s'ajoute à la présence de cet objet et nous conduit à le désigner désormais comme objet-temps. Autrement dit, le plan temporel selon lequel se définit la valeur d'un tapis est double : il appartient au présent et au passé. C'est justement ce qui distingue l'univers du tapis de celui de la mode. Pour la mode il y a un passé qui s'interprète comme la mort. Tandis que pour le tapis le passage du temps est un renforcement de la vie. Les remarques de Landowski sur la mode permettent de mieux saisir la particularité du tapis qui ne se soumet jamais au tragique de l'absence comme la mort. Le tapis n'est jamais dominé par le démodé.

[La confrontation avec le démodé, forme de nous-mêmes devenue pur souvenir, partage de ce point de vue quelque chose de commun avec une autre modalité, plus tragique, de notre face-à-face avec ce qui « n'est plus » : celle qu'occasionne la disparition – la mort – de l'autre pour peu que les relations qui nous liaient à lui aient fait précédemment de sa présence, toute proche ou plus lointaine, chère ou même détestée, peu importe à la limite, une part déterminante de notre vie.] (Landowski, 1997 : 130)

Cette citation montre bien que contrairement aux objets de la mode, le présent dans lequel s'inscrit le tapis relève d'un présent éternel et en même temps en devenir. De cette façon à la temporalité longue de l'usage du tapis correspond une intensité forte qui prend source dans l'ancienneté. Plus cette temporalité est longue, plus la valeur devient importante. En d'autres termes, cette valeur tire son existence de la lenteur qui offre au tapis un tempo que l'on peut définir comme une forme de vie.

Le temps de l'usage participe à une lenteur qui suggère un contenu ancienneté au tapis. Ce qui nous fait rentrer de cette façon dans un rapport de force : plus il y a de l'ancienneté plus nous avons affaire à une présence d'objet d'art menant à une relation esthétique :

temps de l'usage = la lenteur = le contenu ancienneté = la valeur rajoutée = l'objet d'art = la relation esthétique.

Avec une temporalité longue et un tempo lent, le tapis rentre dans le rang des objets de valeurs à négocier dont le prix dépend toujours de la qualité liée au contenu-temps. En somme, en tant que contenu-temps, le tapis réclame une épaisseur historique. Ce qui signifie que le temps rajoute à l'existant (au tapis), composé d'un matériel et d'une forme engagée, une valeur en devenir qui insère le tapis dans un rapport de force. Ce qui fait constater que le tapis peut s'attribuer une narrativité qui va de la production à l'appropriation et de l'appropriation à des négociations pour de nouvelles réappropriations. Ainsi, le tapis nous introduit dans une co-énonciation qui peut nous engager dans une narrativité depuis la production jusqu'à la distribution, en passant par des usagers qui sont susceptibles de redevenir des vendeurs ou des acheteurs pouvant se transformer en des collectionneurs.

3. Matérialité du tapis: de la fonctionnalité à l'utopie

Fig. 1 : Tapis en soie de Kashan.

Fig. 2 : Tapis en laine.

Fig. 3 : Tapis en coton.

Nos demeures peuvent être décorés par deux types de tapis : le vertical et l'horizontal. Le tapis vertical renvoie à une matérialité beaucoup plus souple et plus fine : de la soie. Alors que le tapis horizontal qui couvre nos sols correspond à une matérialité plus épaisse et plus solide : de la laine ou du coton. Le tapis horizontal répond à des besoins immédiats d'ordre fonctionnel et plutôt pratique. Alors que par sa brillance, sa finesse et une main d'œuvre très sophistiquée, le tapis en soie s'approprie une temporalité plus longue du point de vue de la production. Celui-ci change la fonction de nos intérieurs et leur assigne une nouvelle mission qui relève plutôt de l'esthétique : la verticalité en soie transforme nos maisons en un lieu d'exposition d'art. Le tapis en soie devient ainsi un tapis-tableau qui réorganise nos relations avec l'espace : notre salle peut-elle se substituer à un musée d'art ? Si la réponse est positive, c'est parce que l'objet domestique peut se doter d'une dimension utopique qui nie son aspect fonctionnel pour se rapprocher de l'objet du design. C'est ce qui théâtralise le tapis et change de même notre intérieur en une scène artistique. A ce sujet, on peut se référer à A. Beyaert-Geslin :

[L'objet de design emprunte à la distanciation théâtrale dans la mesure où il se donne en spectacle et se destine à lui-même un spectateur, une instance d'observation conviée à assister à la requalification de la pratique ordinaire dans la mesure où, associant de même le faire et l'être (le faire permettant de comprendre l'être), il en réunit les prérequis sémiotique : un horizon, un noyau et des actants. S'il diffère pourtant de la vie quotidienne, c'est en raison d'une requalification de son horizon par la finalité sans fin de l'art. Cette différence de finalité jette une lumière nouvelle sur la définition de la scène prédictive qui ressortit désormais au domaine du théâtre et non de la vraie vie]. (2012 : 122)

Le tapis théâtral crée donc une certaine distance entre le tapis et les usagers. Tout se passe comme si le tapis en soie restait distant de nous, nous refusant son aspect tactile au profit du seul trait visuel pour nous dominer. Le tapis-musée devient ainsi envahissant. C'est lui qui re-métaphorise notre espace. C'est lui qui nous domine. C'est lui qui nous maîtrise. Il s'agit donc du tapis qui réorganise notre espace par son caractère d'objet esthétique et distant.

L'espace familier *devient* ainsi l'espace du partage. Un espace social avec des traits de collectivité. Le particulier change en divers et en multiple.

4. Espace de distribution et de réinsertion

S'oppose ainsi au tapis vertical le tapis couché sur le plancher ou sur le sol de notre intérieur. La matérialité du tapis change. D'une matérialité très fine et très légère, on passe à une matérialité plus épaisse et moins fine.

Il s'agit des tapis de consommation et d'usage. De cette façon, le rapport humain change. C'est la réalité pratique qui prend le dessus sur l'aspect utopique. Nous n'avons pas l'intention de dire que le niveau pratique mise en jeu par une relation du corps à corps amoindrit la valeur significative des relations que nous entretenons avec le tapis. Nous voudrions tout simplement dire que le tapis horizontal se caractérise par l'agencement de nos actions qui changent les scènes théâtrales en des valeurs suscitées par le déroulement de nos actions quotidiennes (faire la prière sur un tapis est une action qui réajuste la signification de ce tapis). Selon J. Fontanille :

...le cours même de la pratique est un agencement d'actions qui construit, dans son mouvement même, la signification d'une situation et de sa transformation. Le cours d'action

transforme en somme le sens visé par une pratique en signification de cette pratique.
(2008 : 3)

Il s'agit cette fois d'un rapport tactile. On s'assoit sur le tapis et on marche là-dessus, ce qui le rapproche d'une réalité pratique. En effet, d'un contenu métaphorique, imaginée, asserté, mais non assumée du tapis-musée, nous passons à un contenu pratique, assumé et maîtrisé de tapis. Autrement dit, d'un mode existentiel de virtualisation, nous passons à un mode existentiel d'actualisation et puis de réalisation. Notre corps devient donc contigu au corps du tapis. Les deux corps se touchent. Mais contrairement au tapis vertical, nous sommes cette fois sur le tapis; ce qui rend compte de l'état de notre dominance. Les deux corps se trouvent cette fois dans une position d'interaction. Le tapis accueille notre corps et lui donne un statu de solidité, d'assurance et d'intimité : poser les pieds sur, s'asseoir, se coucher sur un tapis, sont autant de pratique régulatrices de notre rapport aux choses.

4.1. Tapis en laine et tapis en soie : deux univers qui se contredisent
